
EAT THAT FROG

21 Great Ways to Stop Procrastinating and Get more Done in Less Time

BY BRIAN TRACY

The Big "So What"

Almost everyone today has too much to do and too little time. Built on 30 years of time-management study, this book presents 21 tips to help you stop procrastinating and get more work done. It's a practical action guide for anyone who feels overwhelmed, or wants to be more effective in planning, prioritising and achieving more results in less time.

Introduction

The key to success is not to try to do everything, but to focus fully on the most vital tasks, take action, and complete them well.

- The analogy of **eating frogs** comes from Mark Twain, who says that if you can start your morning by eating a live frog, you'd have tackled the worst thing that can happen that day.
  - Your *frog* is your most crucial task—what you're most likely to defer, yet can create the biggest impact on your outcomes.
  - There are *2 rules* to frog-eating. Eat the ugliest frog first, and don't look at it for too long before eating it.
- Rather than dwell on theory or concepts, Tracy zooms in on actionable tips that you can **apply instantly**.
  - It's vital that you *take action immediately*, as that's the only way to get results.
  - Each time you complete a vital task, it releases endorphins which make you feel great. By developing a "*positive addiction*"

KEY QUOTES

"Every idea in this book is focused on increasing your overall levels of productivity, performance, and outcome and on making you more valuable in whatever you do."

"The ability to concentrate single-mindedly on your most important task, to do it well and to finish it completely, is the key to great success, achievement, respect, status and happiness in life."

to this feeling of starting and completing important tasks, you're forming a crucial success habit.

- To form any new habit (including the habit of eating frogs), you need the **3Ds of New Habit Formation**: Make a *decision* to build the habit of completing tasks, have the *discipline* to keep applying the ideas in this book, and have the *determination* to persevere until the habits become an integral part of who you are.

- To fast-track your progress, create a **clear mental picture** of yourself as someone who habitually completes important things, fast and strong.

1. Set The Table

To identify your frog, you first need *clarity* on what you truly want. Clarity helps you to overcome procrastination and take concrete action, and it's probably the most critical productivity ingredient. One secret is to **think on paper**. People with clear, written goals can accomplish 5-10 times as much as others. Use these **7 steps** to set and achieve goals:

- Decide specifically *what you want*.
- *Write it down*. Think on paper and make it tangible.
- Set a *deadline* for the goal, with sub-deadlines as needed.
- *List* down everything you may need to do to achieve your goal.
- Break things down into individual tasks, and arrange them in priority and sequence to *form a plan*.
- *Take action immediately*. No amount of thinking can outdo action.
- *Do something everyday*, however big or small, to move yourself toward your major goal. Don't miss even 1 day.

KEY QUOTES

"When you train yourself…to overcome procrastination and get your most important tasks completed quickly, you will move yourself onto the fast track in your life and career and step on the accelerator."

"The number one reason why some people get more work done faster is because they are absolutely clear about their goals and objectives, and they don't deviate from them."

"An average plan vigorously executed is far better than a brilliant plan on which nothing is done."

"Once you start moving, keep moving. Don't stop."

EAT THAT FROG!

Start by listing 10 goals for the next year, writing them in present tense as if the year has passed and they're a reality, e.g. "I weigh X pounds". Select 1 goal that will create the biggest positive impact, write it down separately and apply the steps above to take action daily.

2. Plan Every Day In Advance

The 10/90 Rule says that the first 10% of time used to plan your work can save you 90% of the execution time once you start. One minute of planning can save you 10 mins of execution time, and help you improve your "return on energy". By setting aside 10-12 mins for planning, you can save 2 hours on execution the next day.

Every night, **list down** all the items you must complete the next day. Allow your subconscious mind to work on the list while you sleep, so you can wake up with new ideas on how to achieve them.

Use **different lists**, including a *master list* (of all the possible tasks you must do at some point), a *monthly list* (for the month ahead), a *weekly list* (for the week ahead), and a *daily list* (for the next day).

Tick off the items as you complete them, to motivate and energize yourself on your progress.

EAT THAT FROG!

From today, plan out each day, week and month in advance. Work from prioritised lists, starting with what you must do in the next 24 hours.

3. Apply The 80/20 Rule To Everything

Many people focus on their number of tasks and amount of activity, rather than the importance of the tasks or the achievements.

KEY QUOTES

"The very act of thinking and planning unlocks your mental powers, triggers your creativity, and increases your mental and physical energies."

"Start with the end in mind and work backward."

"Stead, visible progress propels you forward and helps you to overcome procrastination."

The Pareto's Principle, or 80/20 Rule, says that 20% of your activities will account for 80% of your results.

Find the **1 top task** that's worth the other tasks combined—this is the frog you must eat first. Often, this is also the most difficult and complex task you'll tend to procrastinate on.

The crux of time management is to control your **sequence of events**, or what you do next. Resist the temptation to clear the small tasks first; instead, start your day by asking, "Is this task in the top 20% or bottom 80% of my activities?", and focus only on the most vital tasks first. Completing an important job need not take more time than an unimportant one, but it'll yield greater satisfaction.

EAT THAT FROG!

List down all your key goals, responsibilities, projects and activities. Identify the top 10-20% and always work on them first.

4. Consider the Consequences

Successful people are able to look 10 or 20 years into the future, and make decisions today that are consistent with their desired long-term future, including making short-term sacrifices. When considering whether to do or not do something, ask yourself if it has any consequences for your long-term vision.

You can never have enough time to do everything. Rather than set deadlines for everything and feel stressed for missing most of them, focus on the most important task, and give it 20% extra time, so you can do it really well. Use these **3 questions** to find your focus:

- Which are my activities with the highest-value?
- What can I and only I do that if done well will make a real difference? [This question originated from Peter Drucker.]
- What's the most valuable use of my time right now?

KEY QUOTES

"The hardest part of any important task is getting started on it in the first place."

"Time management is really life management, personally management."

"The mark of the superior thinker is his or her ability to accurately predict the consequences of doing or not doing something."

"Long-term thinking improves short-term decision making."

EAT THAT FROG!

Keep asking: What's the one thing which, if I did really well, could create the biggest positive impact in my work and life? Apply this question to find the best thing to do every hour, starting right now.

5. Apply Creative Procrastination

Since you can't do everything, choose to procrastinate on low-value activities by giving them less or no time, so you free up time and priority for what's truly valuable, e.g. giving up TV time for family time or exercise.

EAT THAT FROG!

Ask yourself, "If I weren't already doing this, would I have started doing it today?" Select 1 activity from each area of your life to eliminate or put aside until your more important goals are achieved.

6. Use the ABCDE Method

Use this technique for setting your daily priorities. Start by listing everything you must do the next day. Rate each item A, B, C, D, or E.

A "**A items**" are those with the most serious consequences if left undone, and only you can do them. If you have more than one A-task, prioritize them further with A1, A2, etc. A1 is the ugliest frog to eat first.

B "**B items**" are things you should do, but with only minor consequences. Always finish A items before starting on B items.

C "**C items**" are nice to do, but have no consequences if left undone.

KEY QUOTES

"Creative procrastination is the act of thoughtfully and deliberately deciding upon the exact things you are not going to do right now, if ever."

"Everyone procrastinates. The difference between high performers and low performers is largely determined by what they choose to procrastinate on."

"**D items**" are what you can delegate, to free up time for A items.

"**E items**" are what you can eliminate totally with no consequence.

The key is to stay disciplined—start immediately on A1 and don't get distracted until it's completely finished.

EAT THAT FROG!

Go through your work list now and apply the ABCDE method. Start working on A1 immediately until it's done. Do this daily for 1 whole month, until it becomes a habit.

7. Focus On Key Result Areas

Most jobs can be broken down into 5-7 key result areas. A key result area is (a) what you're fully responsible for, (b) won't be done if you don't do it, (c) is under your control, and (d) produces an output that impacts others' work. For example, key result areas in management are: planning, organizing, staffing, delegating, supervising, measuring and reporting. Those for sales are: prospecting, building trust, identifying needs, persuading effectively, answering objections, closing the sale, and getting resales/referrals.

Identify your **key result areas** with your boss and team, so there's a clear list of vital outputs and responsibilities to focus on.

Then, **rate yourself** for each area on a scale of 1-10. You're only as strong as your weakest link, and tend to procrastinate in your areas of weakness.

Identify **areas for improvement** by asking: What's 1 skill which, if I become excellent at, will create the biggest positive impact on my career (or life)?

EAT THAT FROG!

Define your key result areas, grade them, and identify the 1 skill that'd help you most in your work. Discuss this list with your boss, staff and coworkers.

KEY QUOTES

"The starting point of high performance is for you to identify the key result areas of your work."

"Your weakest key result area sets the height at which you can use all your other skills and abilities."

8. Apply The Law Of Three

Use the "**quick list method**" to identify the 3 core tasks that make up 90% of the value you contribute to your business or organization.

In just 30 seconds, write down the **3 most important goals** of your life—the answers that come to you immediately are often the most accurate ones.

Typically, the **3 most important areas** to people are: career, family/relationships and health/fitness. Define one goal in each of these areas, grade yourself and identify where you need improvement.

Remember that the aim of time management is to free up more time for what truly matters to you. Thus, when you're at work, be truly at work, giving it 100% of your focus and effort. Each minute wasted in idle chit-chat at the office is a minute lost for you and your family. The key to achieving **work-life balance** is to deliberately complete your work efficiently and effectively, so you can spend quality time at home and with your loved ones.

EAT THAT FROG!

Ask yourself: "If I could do only 1 thing all day, what's the 1 task that will bring the most value to my career?" Identify your 3 most important work tasks, and the 3 most important goals in each area of your life. Prioritize them and work on them every single day.

9. Prepare Thoroughly Before You Begin

When you're fully prepared, you overcome procrastination and achieve much better results.

Set up your work area comfortably, and **clear your workspace** so you only have your most important task in front of you;

Prepare all the **information, tools and materials** you may need, and lay them out neatly and in sequence in front of you; and

KEY QUOTES

"You must never lose sight of the fact that the reason for working efficiently is so that you can enjoy a higher quality of life at home with your family."

"When you are fully prepared, you are like a cocked gun or an archer with an arrow pulled back taut in the bow."

Manage your **body language**—sit up straight and feel like a high-performing individual. Tell yourself, "let's get to work!", and don't stop until you've completed the task.

EAT THAT FROG!

Clean up your workspace so you feel positive, productive and effective each time you settle down to work.

10. Take It One Step at a Time

To facilitate crossing of the Sahara Desert, the French marked the track (which was perpetually covered by sand) with oil drums every 5km. Just by following the next visible oil barrel at any one time, you can cross all 500 miles of the desert. Likewise, you can eat your biggest frog bite by bite, focusing on taking one action step at a time.

EAT THAT FROG!

Choose any task or goal you've been procrastinating on. List down the steps and just start instantly by completing 1 item on the list. Then do one more, and the next…

11. Upgrade Your Key Skills

When you feel inadequate or lack confidence in something, you're more likely to procrastinate on it. Continually upgrade your skills in your key result areas—this keeps you up-to-date, and provides the confidence and energy to get things done effectively. Build your mental muscles, using these 3 steps to master any field:

- Read about your field at least 1 hour daily.
- Take every available course and seminar available on the key skills.
- Convert your travelling time to learning time by listening to audio programs.

KEY QUOTES

"Your job is to go as far as you can see. You will then see far enough to go further."

"Feeling weak or deficient in a single area is enough to discourage you from starting the job at all."

"Continuous learning is the minimum requirement for success in any field."

EAT THAT FROG!

Identify the key skills and competencies that you need to become a leader in your field. Resolve to be a master of your craft: set a goal, make a plan, and start developing yourself in those areas.

12. Leverage Your Special Talents

All of us have unique talents and abilities—your job is to find out what they are, and hone them so you can become truly outstanding. Your skills are valuable assets—even if you lose all your money, you can earn it back with the right skills. To identify your talents, consider what you love to do and earns you the most praises or compliments from others.

EAT THAT FROG!

Ask yourself: What do I love most about my work? What has contributed most to my success? If I could have any job, what would I do? To unlock your potential, focus on the areas that you love and have special talents in.

13. Identify Your Key Constraints

In any task or goal, there will always be limiting factors. Sometimes, a small constraint (e.g. a wrong perception or missing process) can create huge bottlenecks.

- Only 20% of your constraints in work/life are external. 80% are **internal** to you (e.g. your beliefs, habits, disciplines, skills). Start by taking full responsibility for your results. Looking into yourself, and ask: What in me is holding me back? What's determining how fast I can achieve my goals?

- Once you've correctly identified your **most critical constraint**, focus fully on eliminating it. When you start your day by removing a key constraint, it'll energize and empower you.

KEY QUOTES

"Become a lifelong student of your craft."

"Your job is to identify your special areas of uniqueness and then to commit yourself to becoming very, very good in those areas."

"Often, alleviating a key constraint or limiting factor is the most important frog you could eat at that moment."

EAT THAT FROG!

Look at your most important goal. Identify 1 key constraint using the questions above, and take any action instantly to remove it.

14. Apply Pressure On Yourself

Only about 2% of people are leaders who push themselves to get things done, rather than wait for others to do things for them.

Set **artificial deadlines** for yourself, e.g. imagine you are leaving for long a holiday tomorrow and must finish all your critical tasks today.

Aim to be a role model, and set the bar as the leader in your field. **Make it a game** to push yourself to go the extra mile, and beat your own records or deadlines.

EAT THAT FROG!

Define the steps for every major job/ project, set deadlines for yourself and make it a game to race against your own clock.

15. Maximize Your Personal Powers

Our performance and productivity depends on our level of physical, mental, and emotional energies. When we're tired after working for long hours, or lack rest, it's like trying to see through a mental fog or walk through sludge.

Analyse your energy levels, identify your **peak periods** (e.g. early in the morning, in the afternoon), and do your most important tasks at these times. When you're tired, use the time to rest rather than work unproductively.

Rest and **recharge regularly**. Go to bed early 5 nights a week, and make a conscious effort to, say, skip TV for an extra hour of rest. Take 1 full day off every week when you totally put

KEY QUOTES

"You must choose your own frogs and then make yourself eat them in their order of importance."

"One of the most important requirements for being happy and productive is for you to guard and nurture your energy levels at all times."

aside work, and allow your brain to rest. Take regular vacations, including short weekend trips and longer two-week trips to reenergize yourself.

Take care of your **physical health**: Eat well, and exercise 200 minutes each week.

EAT THAT FROG!

Analyse your energy levels. Identify what you should (a) do more of, (b) do less of, (c) start doing, and (d) stop doing. Select 1 activity that can improve your health/energy, and repeat it until it becomes a habit.

16. Motivate Yourself Into Action

How you interpret things and talk to yourself affect how you feel, and whether you're motivated or demotivated, energized or de-energized.

Be an **optimist**: (a) Look for the good in any situation, (b) find valuable lessons in setbacks, (c) seek solutions to problem, and (d) constantly think and talk about your goals.

Don't complain about your problems. Instead, s**peak to yourself positively** until you believe those statements (e.g. "I can do it!", "I love myself!").

EAT THAT FROG!

Take control and responsibility of your mind. Focus on solutions, improvements and what you want (not problems, failures or what you don't want).

17. Stop the Technological Time-Drain

Use technology as a tool to effectively communicate and connect anytime, anywhere. However, don't become enslaved by it.

Constant communication is unnecessary, and can be addictive and overwhelming. For example, only a small portion of your emails require your immediate attention. If you missed a truly

KEY QUOTES

"To keep yourself motivated, you must resolve to become a complete optimist."

"Technology can be your best friend or your worst enemy."

"Sometimes, to get more done of higher value, you have to stop doing things of lower value."

vital email or message, the sender will contact you again. **Reduce incessant, low-value communication**, to free up time for high-value work.

To stay calm, clearheaded, and in your peak condition, learn to **detach regularly** from technology and communication devices, especially on your off-day or vacations.

EAT THAT FROG!

Create "zones of silence" daily, e.g. switch off all communication devices and technology for 1 hour in the mornings & afternoons. Stay away from technology for 1 day each week to clear your mind.

18. Breakdown the Task

When a task seems too big and insurmountable, we tend to procrastinate. Psychologically, it's easier to get started on a small task than take on a huge project. Moreover, completing a task gives you a sense of satisfaction that energizes you to take on the next task, then the next, until the job is completed. Break the task down, so you can conquer it bit by bit:

The "**salami slice**" approach: Slice the job up (like slicing a roll of salami), and tackle it one slice at a time.

The "**Swiss cheese**" approach: Set aside a fixed amount of time to work on the project, with the goal of punching a hole in the task. Then, take a break and do something else before returning to punch another hole.

EAT THAT FROG!

Use either of the methods above to tackle a big task you've been procrastinating on. Do it now!

19. Create Large Chunks of Time

Most important, high-value activities (e.g. sales calls, executive planning) require chunks of unbroken time to complete.

KEY QUOTES

"Very few things are so important that they cannot wait."

"The bigger the frog you eat, the greater the surge of personal power and energy you experience."

"Your job in time management is to deliberately and creatively organize the concentrated time periods you need to get your key jobs done well and on schedule."

Use a time-planner to plan for your day in advance. Find ways to consolidate 30/60/90 minute blocks of time, when you can focus on your most important tasks with no distraction. **Schedule the time blocks** in your planner as appointments with yourself.

When you're **travelling** for business, use the time on the plane to plan ahead and/or get work done. You'd be amazed at how much you can complete during that window of uninterrupted time. Make every minute count!

EAT THAT FROG!

Be creative in how you free up chunks of concentrated time. Plan in advance and use this time to work continuously without distraction.

20. Develop a Sense of Urgency

To be highly productive, you must set aside the time to think, plan, and set priorities, then get to work steadily, briskly and with urgency.

When you habitually work on your most important tasks with speed and focus, you're more likely to "**get in the zone**" or get "in flow". In this state, you function at a higher plane with clarity, creativity, and competence, feel energized and achieve effortlessly.

When you're regularly in the zone and working toward your most important goals, you overcome inertia and create **momentum**. You take less energy to keep going and complete your goal.

EAT THAT FROG!

Identify an area where you tend to procrastinate. Resolve to take fast and prompt action, until the sense of urgency becomes a habit.

KEY QUOTES

"A sense of urgency feels very much like racing against yourself."

"A fast tempo seems to go hand in hand with all great success."

21. Single-Handle Every Task

Single handling basically means that, once you begin a task, you keep working on it (without distraction or deviation) until it's done.

- Constantly **starting-and-stopping** a task can take you as much as 500% of the time, since you must re-orientate yourself, overcome inertia and regain momentum each time.

- By learning to focus on your most valuable task and persevering single-mindedly until it's complete, you're moulding yourself for success, by cultivating **self-discipline and control**. When you can master yourself, you can conquer any task.

EAT THAT FROG!

Challenge yourself today. Select your most important task or project, start working on it and do not stop until it's completed.

Other Details in the Book to Look out For

This is a succinct, easy-to-read book that breaks down what it means to eat your frog and get more done in less time. Tracy ends the book with a recap of the 21 rules/principles. By applying them until they're a part of you, you can enjoy great results and success, as well as a sense of personal power and satisfaction. The key is to start taking action immediately.

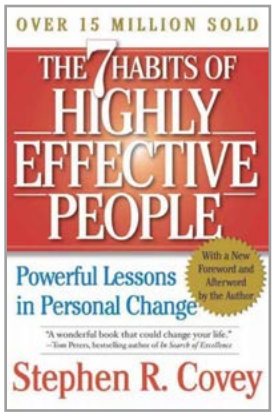
For more details, please visit www.briantracy.com.

KEY QUOTES

"You ability to select your most important task, to begin it, and then to concentrate on it single-mindedly until it is complete is the key to high levels of performance and personal productivity."

"Self-discipline, self-mastery, and self-control are the basic building blocks of character and high-performance."

"Do something. Do anything, but get started."



THE 7 HABITS OF HIGHLY EFFECTIVE PEOPLE

Powerful Lessons in Personal Change

by Stephen R. Covey

The Big "So What"

The book presents a holistic and principle-centered approach to achieve success through positive change from within. Covey's 7 habits were based on a review of some 200 years of success literature, and his ideas still form the foundation for many personal development books and programs today.

Introduction

To become more effective, you need to increase your Production(of desired results) and Production Capacity (the capacity to deliver such results). A central idea of his book is to improve P/ PC from "inside-out", i.e. start with change within oneself. This goes beyond merely improving one's skills or knowledge, but deals fundamentally with who you are, or who you become as an individual. The habits are progressive in nature, though there's no need to perfect one habit before moving on to the next. Each habit sets the foundation for the next level:

Dependence => Independence:
Habits 1-3 provide your "Private Victories" as you develop your character and self-mastery.

Independence => Interdependence:
Habits 4-6 shift how you interact with others, to form trusting relationships with healthy emotional bank accounts. These are your "Public Victories."

Renewal:
Habit 7 creates an upward growth spiral as you continually renew and grow yourself and hone the 6 previous habits.

KEY QUOTES

"Inside-Out" approach

"Change - real change - comes from the Inside-Out... It comes from striking at the root - the fabric of our thought, the fundamental, essential paradigms, which give definition to our character and create the lens through which we see the world".

"Inside-Out" means to start first with self; even more fundamentally, to start with the most inside part of self -- with your paradigms, your character, and your motives".

"Although the habits are sequential, improvement in one habit synergistically increases your ability to live the rest".

Independence

"Real self-respect comes from dominion over self, from true independence... Interdependence is a choice only independent people can make."

Habit 1: Be Proactive

This essentially means to take full responsibility for your lives and choices. To be proactive, you should:

Take the initiative:
No matter what your circumstances are, or what happens in your life, you have total freedom to choose your responses. When you take the initiative to be response-able, you empower ourselves to create your situations and not vice versa.

Choose proactive language:
Use proactive language like "I can", "I will", "I choose to". Avoid language like "I can't", "I have to"…

Focus on your Circle of Influence.
Focus your energy on your Circle of Influence, i.e. areas you can do something about. One area that is fully within your control is who you want to "be", i.e. how you think and act. This is opposed to the Circle of Concern, i.e. areas you have little or no control over, e.g. national economy, the weather.

Habit 2: Begin with the End in Mind

This is the habit of personal leadership. It is about having a clear vision in your mind on your end destination and goals. This is important because everything happens first in your mind before becoming reality in the physical form.
To get started:

Develop a Personal Mission Statement.
This should map out who you want to be, what you wish to accomplish in life, and the values or principles which will define who you are. This statement will guide your daily tasks and priorities.

KEY QUOTES

Responsibility
"Response-ability (is) the ability to choose your response."

Begin with the End
"This habit is called Personal Leadership because leadership is considered to be the first creation of your vision, and management comes in second and productivity third."

Examine the centre.
This involves identifying what is most important to you. This centre is also the source of 4 life-support factors: Security (it gives you personal strength and self-worth), Guidance (it guides your decisions and life direction), Wisdom (it is your source of perspective and balance) and Power (it is your source of strength to make choices and accomplish something).

When you centre your life around unwavering internal principles (as opposed to external factors like your family, spouses, money or career) you will have a more stable foundation for personal effectiveness.

Habit 3: Put First Things First

With clear priorities identified and created mentally (Habit 2), you move into the habit of personal-management. This is where you exercise willpower and discipline, to organise and implement activities that translate your goals into reality.

	urgent	not urgent
important	Quadrant I	Quadrant II
not important	Quadrant III	Quadrant IV

Using the time-management matrix above, Covey explains that your goal is to prioritise time for Quadrant II activities, and he lays out 6 key principles of effective Quadrant II management:

Coherence:
Your personal mission statement is aligned with and reflected in everything you desire, plan and do.

Balance:
There is balance and due attention given to various important areas like your family, health and personal growth.

"People" Dimension:
Besides adhering to an efficient schedule, give focus to effective dealings with other people.

KEY QUOTES

"As a principle-centered person… you have a high degree of security, guidance, wisdom, and power that flows from a solid, unchanging core."

Put First Things First

"It's the exercise of independent will toward becoming principle-centered. It's the day-in, day-out, moment-by-moment doing it."

"Most people say their main fault is a lack of discipline… I believe that is not the case. The basic problem is that their priorities have not become deeply planted in their hearts and minds. They haven't really internalized Habit 2."

Flexibility:
Use planning tools, but don't become a servant to them.

Portability:
Ensure your tools (including your personal mission statement) are portable and can follow you most of the time.

Focus:
To ensure you are preventing and not prioritising crisis, Covey recommends weekly planning, with 4 key activities:

a) Identify Roles : Write down the key roles in your life

b) Select Goals : Identify 2-3 key results to achieve for each role in the coming week, incorporating Quadrant II activities.

c) Schedule : Plan the week ahead and set aside time for these goals.

d) Adapt Daily : Adjust activities to manage unexpected developments.

Habit 4: Think win-win

This is the habit of interpersonal relationship. Win-win is a mind-set and philosophy built on an approach of achieving mutual benefit for the parties involved. Where a win-win solution cannot be reached, consider agreeing to disagree amicably, rather than "force" a deal. To achieve win-win, there are 5 dimensions, each built on the previous layer:

Character
There are 3 critical character traits for win-win:

- *Integrity:* Being true to your values, commitments and feelings
- *Maturity:* Blending courage (to express your ideas and feelings) and consideration (for others' ideas and feelings)
- *Abundance Mindset:* The belief that there is more than enough for everyone

KEY QUOTES

"The key is not to prioritize what's on your schedule, but to schedule your priorities".

Think win-win
"Win-win is not a technique; it's a total philosophy of human interaction".

Relationships

Built based on trust and a positive Emotional Bank Account. The EBA is a key foundation to interdependence, and there are 6 ways to make a deposit or grow the account.

- Understand the other person
- Attend to the Little Things (e.g. small acts of kindness and courtesy)
- Keep Commitments or promises
- Clarify Expectations (and assumptions)
- Show Personal Integrity (i.e. tell the truth and be true to our words regardless of whether we are watched)
- Apologize sincerely when you make a withdrawal

Agreements

Establish a framework for win-win, including the desired results, guidelines, resources, accountability and consequences.

Supportive Systems

Free people up to concentrate on win-win.

Processes

Use processes that facilitate win-win outcomes.

Habit 5: Seek First to Understand, Then to be Understood

This is the habit of communication, and it is built on emphatic listening. Emphatic listening represents an entire paradigm shift because it is not about applying listening skills, but "listening with intent to understand". This is opposed to how most people listen – with the intent to speak or respond; They are still in their own frame of reference, not that of the other person's.

Covey stresses that Habits 1-3 are critical because emphatic listening opens you up to influence by others. Without a "changeless inner core", it will be hard to manage such external influence.

KEY QUOTES

Emphatic Listening

"In empathic listening, you listen with your ears, but you also, and more importantly, listen with your eyes and with your heart... You sense, you intuit, you feel".

"When we really, deeply understand each other, we open the door to creative solutions and Third Alternatives".

When you listen emphatically, you use both sides of your brain, and you are able to respond by both rephrasing the content in your own words, and reflecting how the other party feels. This habit is applicable to all areas of life, as you need to "diagnose before you prescribe".

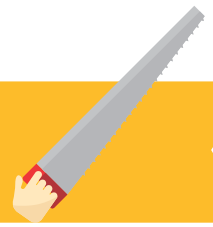
Habit 6: Synergize

This is the habit of creative co-operation, where "the whole is greater than the sum of its parts".

"The essence of synergy is to value differences" and "the key to valuing those differences is to realize that all people see the world, not as it is, but as they are". You will inevitably have mental, emotional and psychological differences in your perceptions compared with others. When you acknowledge that people are all 'correct' in their different perspectives, and are prepared to "value this difference", you gain new knowledge and understanding of reality, and open up Third Alternatives.

Synergy brings about a catalytic, mind-expanding, creative process which can be both exciting and scary. This is because you are letting go of old paradigms, and co-creating new paths or options that previously didn't exist. Often, you don't know where exactly those paths will lead you.

Habit 7: Sharpen the Saw



This is the habit of self-renewal, and has a synergistic impact on all the other habits. There are 4 key dimensions to be renewed regularly:

Physical:
To preserve and enhance the capacity of your physical bodies, you need to care effectively for it, including eating right, getting sufficient rest, and exercising regularly.

KEY QUOTES

Valuing differences

"The key to valuing …differences is to realize that all people see the world, not as it is, but as they are."

"When you communicate synergistically, you are simply opening your mind and heart and expressions to new possibilities, new alternatives, new options".

Sharpening the Saw

"Renewal is the principle -- and the process -- that empowers us to move on an upward spiral of growth and change, of continuous improvement … (it) requires us to learn, commit, and do on increasingly higher planes".

Spiritual:
To continually strengthen your core or center, through reading, music, nature, meditation, prayer or other means.

Mental:
To continually expand and hone your mind, through external study programs, examination of your inner programming and paradigms, or reading and writing to sharpen your mental insights and clarity.

Social/ Emotional:
To deliberately practice habits 4-6 in your daily interactions with other people.

All 4 dimensions are interrelated and must be renewed in a balanced way. In fact, when we sharpen the saw in any one dimension, it creates positive synergistic effects on the other dimensions and our 7 habits.

As we develop interdependence, we have the awareness, power and choice to affirm and reflect back to others a positive reflection of themselves, and hence empower and uplift others. “The more we can see people in terms of their unseen potential, the more we can use our imagination rather than our memory…we can "see" them in new fresh ways each time we’re with them”.

Other Useful Details in the Book to Look Out For

The 7 habits in the book may seem simple, but may not be easy to implement in real life. Covey elaborates on each of the concepts and ideas with details and examples, so we understand how to apply them. He also provides many practical tips including:

1. Application suggestions on how to apply each of the 7 Habits.
2. Practical tips and small details that affect the effectiveness of how each habit is executed, e.g. the importance of using

KEY QUOTES

visualizations and affirmations in developing and reviewing Personal Mission Statements.

3. Example and illustrations to help us understand the 7 habits, including application at a personal and family/ organizational level.

About the Author of The 7 Habits of Highly Effective People

Dr. Stephen Richards Covey was an American businessman, educator, author, and keynote speaker. Besides *The Seven Habits of Highly Effective People*, some of his more popular books include *First Things First*, *Principle-Centered Leadership*, *The 8th Habit*, *and The Leader In Me*.

Covey was one of the most influential thought leaders on leadership, strategy and individual effectiveness. In 1996, he was named one of Time magazine's 25 Most Influential Americans. He founded the Covey Leadership Center, which later became FranklinCovey Co., after a merger with Franklin Quest in 1997.

QUIET

The Power Of Introverts in a World That Can´t Stop Talking

SUSAN CAIN

The Big "So What"

Many people believe that to be an achiever or a great leader, you must be bold, action-oriented, outgoing, and aggressive, i.e. you must be an extrovert. In this book, Cain explains why this perspective is flawed, why introverts may be severely undervalued, and how we can bring out the best in ourselves and others by changing the way we see introversion.

In this summary, we've distilled and re-organized the key ideas from the book into **3 parts:**

- Understanding Introversion and Extroversion
- Debunking the Extrovert Ideal
- Living, Loving and Working Optimally

Understanding Introversion and Extroversion

There is no universally accepted definition of an "introvert" or an "extrovert". However, psychologists generally agree that they differ in several ways:

- They function optimally with different levels of **outside stimulation;**
- They **work differently** and are motivated differently; and
- They have different **social styles**.

No one is a pure introvert or extrovert. Our inborn temperaments can be changed to some extent, and we also behave differently depending on the circumstances. We'll now examine the 3 key differences between introverts and extroverts, and if/how they can be bent or changed.

KEY QUOTES

"If there is only one insight you take away from this book...I hope it's a newfound sense of entitlement to be yourself."

"Whoever you are, bear in mind that appearance is not reality."

Response to Stimulation

Physiologically, introverts and extroverts respond differently to environmental stimuli.

- The amygdala in our brain is like an emotional switchboard—it takes in sensory information and uses these inputs to tell our body how to respond. You can guess a child/infant's *natural temperaments* by observing his/her reactions. Those with an excitable amygdala will react more wildly (e.g. howl or wriggle) to new people and objects, and think/feel more deeply about what they've noticed.

- Our temperaments affect how we *interact with our environment* to shape our adult personality. An extroverted child raised in a safe, attentive environment can mature with a huge personality (e.g. Tony Robbins or Oprah Winfrey), whereas the same child raised in a dangerous environment without constructive outlets for his/her energy may end up in delinquency.

- The *orchid hypothesis* by David Dobbs says that children with highly-reactive amygdalae are like orchids. They're more strongly affected by both positive and negative experiences. Hence, they wilt easily and may tip into depression or anxiety if they experience challenges like abuse or parental death. However, with good parenting and a stable environment, they can become exceptionally empathic, caring individuals who thrive in the areas they care about.

Thinking and Working Style

Introverts and extroverts also work and think differently.

- *Extroverts* tend to act quickly (and sometimes rashly), are more comfortable with risks and multi-tasking, and are driven by the thrill of pursuing rewards like money and status.

- *Introverts* tend to work more slowly and deliberately, focus on one task at a time, and are relatively less attracted to wealth and fame.

KEY QUOTES

"Introverts and extroverts often need very different levels of stimulation to function at their best."

"The high-reactive babies were not misanthropes in the making; they were simply sensitive to their environments."

"Every behavior has more than one cause. Don't ever forget that!"
- Jerry Kegan

"If genius is one percent inspiration and ninety-nine percent perspiration, then as a culture we tend to lionize the one percent. We love its flash and dazzle. But great power lies in the other ninety-nine percent."

This is partially due to differences in **rewards-sensitivity**, or the tendency to seek rewards and goals like money, social status, sex and influence.

- *Extroverts* tend to be more rewards-sensitive; they're stimulated by achieving economic, political, and hedonistic goals. This "high" gives them the energy to work hard, play hard and take risks. However, people who are *too* sensitive to rewards may get carried away, e.g. become so excited about potential winnings from the stock market that they overlook the warning signals.

- On the other hand, *introverts* are less rewards-sensitive; they're more likely to have a plan and stick to it, since they're better at regulating their emotions and delaying gratification.

Problem-solving. Extroverts are better at handling information-overload, pressure and multi-tasking, while introverts are better at solving complex problems through clarity, patience and persistence.

- *Extroverts* tend to focus on what's in front of them and direct most of their energy to the current goal. They're action oriented, are more likely to take short-cuts, or abandon a problem if it gets too frustrating. When extroverts make a mistake, they often bulldoze their way through and speed up rather than slow down.

- *Introverts* prefer to contemplate, imagine possibilities and make plans for their future. They tend to think of the "what-ifs", study the data thoroughly, and think before they act. They typically downplay rewards, and persevere slowly but steadily on a task.

Social Styles

Introverts and extroverts also have different **social skills and needs.**

Extroverts need company and dislike solitude.

- They tend to talk more than listen, are comfortable mingling

KEY QUOTES

"Extroverts seem to get an extra buzz from the pursuit and attainment of their goals."

"Reward sensitivity on overdrive gets people into all kinds of trouble."

"It's as if extroverts are seeing 'what is' while their introverted peers are asking 'what if'."

"It's not that I'm so smart... It's that I stay with problems longer."
- Albert Einstein

"If you're an introvert...you have the power of persistence, the tenacity to solve complex problems, and the clear-sightedness to avoid pitfalls that trip others up."

"Your degree of extroversion seems to influence how many friends you have...but not how good a friend you are."

with *large groups of people*, never seem to run out of things to say, and may even blurt things out unintentionally.

- They prefer to *confront conflict* head-on, and respond well to competition and aggression.

Introverts prefer deep, meaningful discussions and one-to-one interactions, ideally with close friends, colleagues, and family.

- They *enjoy solitude*, listen more than talk, consider their responses carefully and dislike small talk and conflict. Thus, they can be very likeable and engaging in an intimate social setting.

- In fact, introverts' *sensitivity* may show up physically, e.g. blushing or perspiring when they're flustered. These traits are valuable socially as they convey humility, a desire to avoid aggression and abide by social rules.

- Introverts generally prefer to *avoid conflict*, and respond better to nurturing, friendly people.

KEY QUOTES

"Physical lack of cool may be more socially valuable than we think."

"Introverts like people they meet in friendly contexts; extroverts prefer those they compete with."

Stretching your Personality

Nature vs Nurture: Your *temperament* is inborn, while your *personality* is shaped from the complex mix of your inborn traits, cultural influence and personal experiences. Only 40-50% of key personality traits, including introversion and extroversion, are heritable.

"Some say that temperament is the foundation, and personality is the building."

You can't change your inborn temperaments, but you can learn to **control your impulses** and stretch your personality to some degree.

- The *pre-frontal cortex* is the part of your brain that handles logic, planning, and analysis; it can moderate your amygdala's impulses.

- When your sensitive amygdala reacts wildly to something new, your frontal cortex can intervene to *soothe these impulses*, such as rationalizing that you can handle the novelty or through positive self-talk. Thus, an introvert can

learn to overcome his shyness, and an extrovert can learn to be quiet.

The Free Trait Theory by Professor Brian Little also suggests that, although we have fixed personality traits, we sometimes act out of character, especially when it comes to "core personal projects", i.e. work, tasks, or people that are especially important to us. An introvert who's usually soft-spoken may become unusually passionate or excited about something that he/she cares deeply about. It's like taking on a temporary "free trait" and switching to extrovert mode.

However, we *cannot* switch off the amygdala or our true nature; we merely suppress it. If we constantly act out of character (even for core personal projects), we'll feel the strain, like a rubber-band that's **overstretched.**

- In short, our *natural discomfort* still surfaces in the amygdala; Practice/training only affects how quickly our frontal cortex can neutralize the impulses.

- In fact, our true selves often seep out through "*behavioral leakage*" or unconscious body language. For example, an introvert may unconsciously look away when engaging a stranger whereas an extrovert would look at the person in the eye.

Debunking the Extrovert Ideal

Today, management and cultural norms in America favor extroversion over introversion. However, both personality types have their strengths and are vital for success.

Extroversion wasn't always a cultural ideal. In the book, Cain traces the shift from the "Culture of Character" to "Culture of Personality".

- Before the 18th century, the focus was on *character*, with associated concepts like honor, discipline, and integrity.

- The interest in *personality* grew alongside the rise of the self-help industry. Americans became increasingly obsessed with ways to become more popular, influential, confident

KEY QUOTES

"We can stretch our personalities, but only up to a point. Our inborn temperaments influence us, regardless of the lives we lead."

"Extroversion is an enormously appealing personality style, but we've turned it into an oppressive standard to which most of us feel we must conform."

"We're told that to be great is to be bold, to be happy is to be sociable. We see ourselves as a nation of extroverts—which means that we've lost sight of who we really are."

and competitive. Commercial ads played up the advantages of being bold, charming, outspoken and gregarious (as opposed to be being shy and inconspicuous).

- By the 20th century, the prevailing belief is that the ideal self is someone who's assertive, sociable, and comfortable being in the spotlight. Cain calls this the "*Extrovert Ideal*".

To research **how the Extrovert Ideal is manifested** in modern society, Cain personally visited, researched and observed many prominent individuals and institutions. Here are some highlights:

- *Tony Robbins and Salesmanship*. At Robbin's *Unleash the Power Within* (UPW) experience, Cain found herself surrounded by loud music, cheering, adrenaline-pumping sessions and dramatic challenges like walking on hot coals. Robbins was the perfect embodiment of power and the superior mind, brimming with energy, confidence and a larger-than-life presence. His belief and energy was so infectious that the audience accepted his aggressive upselling and happily bought whatever he pitched.

- *Harvard Business School (HBS) and Charismatic Leadership*. Students at the HBS are taught that leaders act confidently and can make decisions with incomplete information. Students walk with purpose and confidence, communicate with energy, dress sharply, and are expected to be vocal and attend lots of social functions to build a huge network. HBS students are conditioned to believe that extroversion is essential to success in the business world, and even the introverts try their best to be extroverted.

- *Saddleback Church and quiet evangelism*. At this evangelical church, Cain met with pastor Adam McHugh. As an introvert, McHugh initially struggled with public expectations that he should be enthusiastic, warm and mingle regularly with people in the community. Thankfully, the growth of social media gave him (and other introverts) a new channel to engage others in the community. McHugh has been advocating a more balanced path to god, including a mix of extroverted practices and quiet, contemplative practices.

X While extroversion has its strengths, it's simply **untrue that extroversion is a prerequisite for success.**

KEY QUOTES

"If Abraham Lincoln was the embodiment of virtue during the Culture of Character, then Tony Robbins is his counterpart during the Culture of Personality."

"This school is predicated on extroversion... your grades and social status depend on it."
–A Harvard Business School student

- Many *famous people*—from inventors to leaders and artists—are introverts. In fact, people like van Gogh, Bill Gates, Eleanor Roosevelt, Al Gore, Warren Buffett, and Mahatma Gandhi, probably achieved what they did because of their introversion.

- It's estimated that about *one in every 2 or 3 Americans are introverts*. Rather than condition everyone to act like extroverts, it makes more sense to understand and leverage the unique strengths of both introverts and extroverts.

- In fact, research and studies suggest that *introversion can be just as vital* as extroversion.

Leadership. Studies show that extroverted leaders are not necessarily more effective than introverted leaders.

- Jim Collins found that charismatic, larger-than-life leaders are less effective in *transforming companies* than unassuming leaders who put aside their egos and focus on building their institutions.

- Adam Grant also found that introverted leaders are better at *nurturing proactivity*. Extroverted leaders tend to dominate others, dampen proactivity, and are stronger only in leading passive staff who don't show initiative. On the other hand, introverted leaders are better at leading initiative-takers, since they tend to listen after and adopt others' suggestions.

Mastery. Solitude, or the ability to work independently, is vital for excellence in any field, because it enables "deliberate practice".

- Mastery requires *focused and intentional improvement*. Chess grandmasters spend almost 5x as many hours as intermediate-level players in self-study in their first 10 years of chess play. Elite musicians use solo-practice to master their craft and treat group-practices as a leisure activity.

- Deliberate practice is *best done alone* because (a) it requires intense focus and others' presence can be distracting, and (b) you must identify and master tasks or knowledge that are specifically challenging to you, and this is best tackled alone.

KEY QUOTES

"Some of our greatest ideas, art, and inventions—from the theory of evolution to van Gogh's sunflowers to the personal computer—came from quiet and cerebral people who knew how to tune in to their inner worlds and the treasures to be found there."

"We don't need giant personalities to transform companies. We need leaders who build not their own egos but the institutions they run."

"Introverted leaders create a virtuous cycle of proactivity."

"If you want to improve what you're doing, you have to be the one who generates the move."
- Research Psychologist, Anders Ericsson

Solitude is also vital for creativity and productivity. Today, many organizations are adopting open-concept offices, group brainstorming and collaborative learning, under the wrong assumption that these will enhance creativity and team synergy. Cain calls it this trend the "New Groupthink".

- The success of *online crowdsourcing* has led organizations to model their face-to-face interactions after the openness of the internet. However, it's wrong to assume that online and face-to-face interactions work the same way.

- Great inventors and engineers are like artists: they work best when they can *focus fully* on their tasks. Programmers who had privacy and control over their workspace were found to perform 10x as well as programmers who didn't.

- *Excessive stimulation* hinders rather than promotes learning. You learn better after a quiet stroll through the woods, compared to a walk down a noisy city street. Multitasking can also reduce productivity and increase mistakes by up to 50%.

- Hence, *open-concept* offices are more likely to create distraction and stress than promote creativity. Reebok International shelved its open-concept office when its shoe designers gave feedback that they needed peace and quiet to concentrate. Jason Fried, cofounder of 37signals, allows his staff to work away from the office and enforce no-interruption work hours.

Group work may also hinder creativity:

- Studies have shown that the larger the group, the lower the *number and quality of ideas* generated. This is probably because (a) *social loafing* occurs as some people sit back while others do the work, (b) only one person can talk at a time, so people are unproductive while waiting for their turn, and (c) people hold back their inputs for *fear of looking stupid*.

- In fact, studies found that people don't just hold back their ideas—the inputs from their peers can fundamentally *change their perspective*.

KEY QUOTES

"Instead of distinguishing between online and personal interaction, we used the lessons of one to inform our thinking about the other."

"The New Groupthink elevates teamwork above all else. It insists that creativity and intellectual achievement come from a gregarious place."

"Introverts prefer to work independently, and solitude can be a catalyst to innovation."

"If personal space is vital to creativity, so is freedom from 'peer pressure'."

"We perceive talkers as smarter than quiet types— even though grade-point averages and SAT and intelligence test scores reveal this perception to be inaccurate."

- In a group setting, the louder and more aggressive people also tend to *drown out* good ideas/opinions of the quieter ones. Rousing speeches and loud discussions may also lead poorer outcomes due to emotional and ego-led decisions.

- The only exception is during *online brainstorming*, where individuals do better in a group setting. This is because people are still working on their own despite being connected with others online. People may also be more creative when they work alone in a busy café or city, rather than in total isolation in the mountains.

Living, Loving and Working Optimally

Making the Most of Introversion & Extroversion

Introverts and extroverts have different strengths and weaknesses. Neither is perfect, and we need both for society to function well.

In the book, Cain shows the power of an **extrovert-introvert partnership** through a detailed case study of how Franklin Roosevelt's outgoing and confident nature was balanced by Eleanor Roosevelt's social conscience and sensitivity.

- Being highly-sensitive, *introverts* tend to be more emphatic, philosophical or spiritual, rather than materialistic or hedonistic. They are more in-tune with others' feelings, have stronger consciences, and hold themselves to high behavioral standards. Yet, being slow and cautious could mean missed opportunities.

- *Extroverts* are driven and glad to be in the spotlight, thus providing visibility, speed, risk-taking and the ability to move forward in uncertain situations. Yet being fast and aggressive, they're more likely to make mistakes.

KEY QUOTES

"We fail to realize that participating in an online working group is a form of solitude all its own."

"The sensitivities and the strengths are a package deal."

"We need our Eleanor Roosevelts as surely as grazing herds depend on their sensitive antelopes."

"These traits—alertness, sensitivity to nuance, complex emotionality—turn out to be highly underrated powers."

Maximizing Personal Potential

To be at your peak performance, seek to operate from your sweet spot, and occasionally stretch yourself when the situation requires it.

Find your "sweet spot", i.e. the optimal level of stimulation where you work best and feel most energetic. This allows you to:

- Identify the ideal careers, businesses, hobbies and social life that can *improve your overall satisfaction and success*.
- *Manage the sub-optimal situations* more effectively when you push yourself outside your comfort zone, e.g. request for advance notice to prepare for speeches or networking events.

Manage your thinking:

- Know where you sit on the *rewards-sensitivity* spectrum. If you're a *rewards-prone extrovert*, direct your energy to building things/businesses and inspiring others, but deliberately pause, reflect on warning signals and learn from mistakes. If you're an *introvert*, learn to be seen and heard in your natural way, e.g. sharing your ideas quietly but powerfully.
- *Solve problems* by tapping on extroverts' ability to handle pressure and diverse information/tasks, and introverts' clarity, patience and persistence.

Close communication gaps. Conflict often arises from a lack of understanding between introverts and extroverts. For example, at the end of a socially-overstimulating day, introvert Tom just wants to return to his quiet self and recharge. However, his extrovert wife, June, desires his company, and feels upset that Tom is so engaging with others but clamps up once he's home. The angrier and louder June becomes, the more Tom withdraws (and feels hurt by her lack of understanding), which upsets June further in a vicious cycle.

KEY QUOTES

"Even though we can reach for the outer limits of our temperaments, it can often be better to situate ourselves squarely inside our comfort zones."

"The trick for introverts is to honor their own styles instead of allowing themselves to be swept up by prevailing norms."

- As an *extrovert*, if you feel your anger mounting, take a few deep breaths to calm down first.

- As an *introvert*, even if you don't wish to fight back, learn to take a firm stand and say "this is not ok with me". Use your empathy to consider the true meaning behind the other person's agitation.

Create the **right social setting** where everyone can enjoy themselves. Let extroverts be in the centre of attention or handle a large group, and allow introverts to have cozy, one-on-one chats.

Stretching yourself

Use these 3 steps to **identify your core personal projects**, as these are the most natural for stretching yourself:

- Think back to your *childhood* and what you wanted to be when you grew up. Examine the underlying reasons for those choices, e.g. if you wanted to be a dancer, was it due to the thrill of performing, to move gracefully, or to wear beautiful costumes?

- Consider the *work that you're attracted to*, e.g. the work you volunteer for, and what energizes you.

- Notice what you *envy*, as they reflect your desires.

Find your **restorative niches**, i.e. places or activities where you can be in-character and recharge.

- Before taking on a *new job*, consider if it will offer you the time and opportunity for such restorative niches.

- Use a "*Free Trait Agreement*" to strike a more optimal balance:

  i. *Set a quota* for what you'd do to achieve your goals, e.g. an introvert may decide to attend up to 2 social events a week, then retreat to his/her restorative niche without guilt.

  ii. Agree on a balanced arrangement with your *spouse or*

KEY QUOTES

"Even if you're stretching yourself in the service of a core personal project, you don't want to act out of character too much, or for too long."

friends that meets your mutual needs, e.g. an extroverted-introverted couple may agree to spend 50% of their date nights quietly at home and 50% out mingling with people.

Teamwork and Collaboration

Enhance results by using a blend of group and solitary activities.

Offer a **range of work options**—such as solo workspaces, cafes, quiet zones, and mingling spaces—so people can choose to interact or retreat into their private corners when needed.

Assign tasks based on people's strengths and tap on the **natural symbiosis** in introvert-extrovert relationships.

To improve **learning effectiveness** in schools, use a mix of cooperative learning and deliberate practice.

Nurturing Introverted Children

Avoid forcing introverted kids to become more assertive or energetic. Instead, try to understand how they see the world.

Introduce novelty gradually. Since introverts naturally recoil from novelty and may be overstimulated by new people, places and events:

- Allow your kids to *take things at their own pace*. For very young children, facilitate the initial introductions to other kids, and be around for as long as they need to feel comfortable.

- *Encourage them* when they take social risks, e.g. by saying "I saw you going up to your new classmates earlier. I know it can be difficult, and I'm proud of you."

Build confidence. Don't push them too hard nor overprotect them.

- Instead, help them understand that their feelings are normal and can be managed. *Be supportive*, help them take baby

KEY QUOTES

"The way forward...is not to stop collaborating face-to-face, but to refine the way we do it."

"Slowly your child will see that it's worth punching through her wall of discomfort to get to the fun on the other side. She'll learn how to do the punching by herself."

steps to overcome their fears, e.g. exposing them to a new item from afar, then gradually increasing the engagement each time.

- *Be a role model* to show them how to meet strangers and friends in a calm and friendly way. Over time, they'll learn to reassure themselves and regulate their own fears and behaviors.

- *Create engagement opportunities*, e.g. find topics that energize them, encourage them to choose responsibilities in a group setting (e.g. note-taking), and find activities where they can meet other kids while still having their own space.

Learning and Education. Most schools are designed for extroverts, with overstimulating environments and little time to think or create.

- Remember that introversion isn't a problem to be fixed. Respect each child's uniqueness and *tailor your approach* accordingly.

- Most introverts have *1-2 deep interests*, and the best way to draw them out is to give them a topic that's so compelling that they forget their inhibitions.

- An *ideal learning environment* should come with a mix of movement and group/collaborative work, with downtime, one-to-one interaction and independent projects.

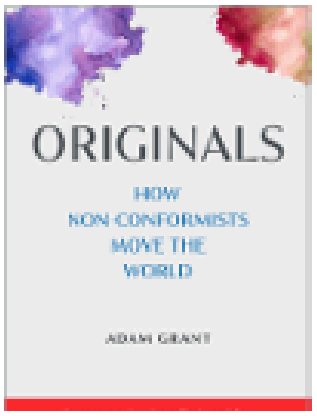
Other Details in the Book to Look out For

This book is packed with anecdotes, examples, and resources including:

- Details of Cain's research and personal meetings with experts, researchers, leaders, professionals etc., as well as relevant research and studies on introversion/extroversion;

- A closer look at Americans' obsession with extroversion, compared with the quiet persistence valued by Asians;

KEY QUOTES



ORIGINALS

How Non-conformists Move The World

ADAM GRANT

The Big "So What"

Most major breakthroughs in our world are made by a handful of people who dare to think differently. Grant calls them the "Originals". In this book, he shows that creativity *can* be nurtured, and explains how each of us can think originally to make a greater impact.

Introduction

Being original is simply about taking a less traveled path to pursue fresh ideas and improvements, even if they conflict with the prevailing norms. It involves having a novel concept and taking action to make it a reality.

It's a myth that Originals are revolutionaries with inborn talents, unusual passion and conviction, and a huge appetite for risk. The reverse is true—Originals are ordinary people, and *anyone* can choose to think differently.

Most people conform to norms in hope of fitting in and avoiding failure. Originals also have their **fears and self-doubt.** In fact, many famous people didn't pursue/publish their ideas until they were "forced" to do so.

- *Michelangelo* refused to paint the Sistine Chapel ceiling because he saw himself as a sculptor rather than a painter. He only agreed to the project after 2 years at the Pope's insistence.

- *Steve Wozniak* started Apple with Steve Jobs in 1976 but refused to leave his full time job at Hewlett-Packard (HP). He only made the leap in 1977 when an angel investor agreed to fund Apple on the condition that Wozniak left HP.

KEY QUOTES

"This book proves that any one of us can champion ideas that improve the world around us."

"The hallmark of originality is rejecting the default and exploring whether a better option exists."

"In search of excellence and in fear of failure, most of us opt to fit in rather than stand out."

"The people who move the world forward with original ideas are rarely paragons of conviction and commitment…they, too, grapple with fear, ambivalence, and self-doubt."

- *Martin Luther King, Jr.* never wanted to lead the civil rights movement. His dream was to be a pastor and college president. Yet, he was swept up by a chain of events after he was nominated as the president of the Montgomery Improvement Association.

New, untested ideas are naturally risky. Yet, Originals are not reckless risk-takers. Instead, they tend to take calculated risks and develop **balanced risk portfolios**. Similar to how successful investors build a balanced investment portfolio, successful people balance the risks in their lives—if they take an extreme risk in 1 area of their life (e.g. business), they'll balance it with extreme caution in other areas (e.g. family).

Using various real-life stories and examples of how Originals succeed and fail, Grant presents useful insights and tips to improve our chances of successful innovation. In this summary, we'll present the key ideas in 2 parts:

- Managing the Risks of Originality; and
- Unleashing Originality at Work and at Home

KEY QUOTES

"To become original...means accepting some measure of risk. But the most successful originals are not the daredevils who leap before they look."

Managing the Risks of Originality

Often, the challenge with creativity is not the lack of fresh ideas, but selecting the right ideas and getting buy-in to make them a reality.

"In reality, the biggest barrier to originality is not idea generation—it's idea selection."

Generating and selecting ideas

Being an Original starts with **being curious**. Don't simply accept the status quo—understand why it exists and challenge how it can be improved. Realize that all rules and systems are man-made and can be changed.

"Rules and systems were created by people. And that awareness gives us the courage to contemplate how we can change them."

A key to originality is to **come up with more ideas**, and use feedback to figure out which ones work.

- We are *bad at predicting* which creations will work. Creators typically go back-and-forth between fresh ideas and old

"Put a lot of ideas out there and see which ones are praised and adopted by your target audience."

ones that they'd previously rejected, until they hit on a winning idea.

- Our first ideas are usually the least creative. As we reject them, we gradually open ourselves up to *newer and better options*. Rather than try to perfect the few ideas you have, develop more options and test them.

As you build the **breadth and depth of your experience**, it expands your frame of reference and improves your creativity.

- *Learn a new craft*. Entrepreneurs and creators who're involved in the arts (e.g. painting, music, literature) tend to be more creative, since they offer new ways to express ideas and feelings using images, sounds, and words.

- *Acquire new skills and knowledge* by requesting for a job rotation or volunteering for new projects.

- *Widen your cultural exposure* by working overseas for several years, ideally immersing yourself in culture(s) that are very different from your own.

Procrastination may be bad for productivity, but can be good for creativity. The key is to **procrastinate strategically**.

- When a task is incomplete, it stays active on our mind. *Take a break* after working on an idea—let it incubate while you explore new options, so you avoid being prematurely fixated on an idea.

- In an *experiment*, students who procrastinated delivered proposals that were 28% more creative. King's famous "*I Have a Dream*" speech in 1963 was written only the night before the event, even though he started gathering material and advice months prior. In fact, the most memorable lines from the speech (including the dream angle) were improvised on the day itself. King was able to do so because he had a wealth of material without prematurely committing himself to 1 angle.

Tapping late-mover advantages. It's a common misconception that to be original, you must be the first. Conventional business wisdom says that the first party to launch a new product/ technology has an edge in terms of market share and learning.

KEY QUOTES

"Procrastination may be the enemy of productivity, but it can be a resource for creativity."

"Great originals... procrastinate strategically, making gradual progress by testing and refining different possibilities."

"The most successful originals don't always arrive on schedule. They are fashionably late to the party."

- However, the *risks of being the first mover* can greatly outweigh the benefits. Pioneers of a new product were found to fail 6x more than "settlers" who entered only after the market was developed. Pioneers who survived also had less than half of the settlers' market share. This is because (a) pioneers are more likely to *overinvest* in something the market is not yet ready for, and (b) settlers can take the time to learn from pioneers' mistakes, adapt to changes in the market/consumer tastes and *balance their risk portfolios* before entering the market.

- It's not always bad to be the first to market. However, don't rush in just to be the first; focus on *learning, adapting and reducing your risks* instead.

It's a myth that older people can't innovate. In fact, we can deliberately **sustain our creativity** by adapting our style of thinking.

- It's true that most innovative breakthroughs come from younger people up to 30-35 years of age. They typically get a creative insight and focus on executing it—an approach called *conceptual innovation*. The process is much faster, but the creator may lack new inspiration after the initial creation.

- On the other hand, *experimental innovation* involves solving problems through trial and error, learning and evolving along the way. This approach takes years, but the accumulated data, knowledge and skills form the foundation for future discoveries.

- As you age, *continuously experiment* with different ideas and solutions; as you build your experience, you may uncover a big idea. Leonardo da Vinci started working on The *Last Supper and Mona Lisa* in his late 40s/early 50s; for both works, he only knew what he wanted to create *after* he started drawing.

Using intuition vs analysis. Our intuitions are only accurate in areas where we've accumulated lots of experience in a predictable environment. In such cases, our brains learn to recognize patterns that allow us to make quick but sound decisions. However, when we lack domain expertise and/or a

KEY QUOTES

"It's true that the early bird gets the worm, but we can't forget that the early worm gets caught."

"Being original doesn't require being first. It just means being different and better."

"Good things come to those who wait, and for experimentalists, it's never too late to become original."

consistent environment, we should use proper analysis instead of relying on our intuition.

Evaluate ideas using peer feedback.

- We tend to be *overly-positive* about our own creations, while managers tend to be *overly-negative* about novel ideas that don't meet existing norms. People who take on the role of an evaluator (as members of a test audience or a focus group) also tend to unconsciously assess an idea based what they think should work. Ironically, the more expertise you have in an area, you more you're likely to reject ideas outside the current norms/rules.

- The best people to get feedback from are your *peers* or fellow creators, as they're more likely to have the domain knowledge to evaluate the idea without being colored by vested interests.

Let's look at how the insights above played out in a couple of **real-life examples :**

- *Warby Parker*. Back in 2008, Luxottica controlled >80% of the eyeglasses market and could charge 20x of the cost price, resulting in outrageously expensive eyeglasses. 4 frustrated students came together to explore ways to offer cheaper eyewear. The team had diversified background in bioengineering, healthcare, consulting, and banking, and 3 of them wore glasses. To manage their risks, they attended an entrepreneurship class, ran surveys and focus groups to identify what people felt about buying glasses online, and developed options to address customers' concerns before launching their free "home try-on program". With all the key ingredients in place, Warby Parker took off; in just 5 years, it grew to >$100mil annual revenues with a valuation of >$1bil.

- *Segway* (a self-balancing personal transporter) turned out to be a flop despite initial hype that it'd be a game-changer. Even big names like Apple's Steve Jobs, Amazon's Jeff Bezos and legendary investor John Doerr believed the technology would be a hit. However, the Segway eventually failed as the team fail to obtain enough critical feedback to refine the product. Even Steve Jobs failed to evaluate the technology correctly because his passion and confidence led him to

KEY QUOTES

"As we gain knowledge about a domain, we become prisoners of our prototypes."

"We often speak of the wisdom of crowds, but we need to be careful about which crowds we're considering."

skip a thorough analysis of this new technology even though he lacked domain experience in transport (being more familiar with computers and design).

Voicing and Championing Original Ideas

How you push for an unconventional idea can affect your career, relationships and determine whether the idea gets adopted.

When you're pitching your idea, **highlight the downsides**, e.g. why someone should not invest in your project, or why they should not buy your business. This works because:

- People are naturally skeptical of new ideas. When you share your weaknesses, they move from defensive to *problem solving mode*.

- If the audience already recognizes the weaknesses, *it makes you seem more trustworthy*.

- People assume that those who're more critical have more expertise and are more discerning. Experiments show that reviewers of a book/artpiece are *perceived to be smarter* if they simply replace a few positive words with negative ones (e.g. "inspired" to "uninspired").

- It triggers a mental bias to *bring a more positive evaluation*. People who're asked to list 3 happy things feel better about their lives compared to those who're asked to list 12. That's because most people can list 3 happy things easily, but struggle to think of 12 things (which makes them feel their lives aren't so good). Highlight 3 key weaknesses and invite your audience to think of other issues—when they struggle to find other problems, they'd assess your proposal more favorably.

Make your idea familiar. Many creators make the mistake of *under-communicating* their idea—they've spent so much time on their idea that they forget others are not as exposed to it.

- The more familiar we are with something, the more we like it because it becomes less threatening and easier to process. To make people comfortable with a novel idea, *repeat*

KEY QUOTES

"Leading with weaknesses disarms the audience."

yourself at least 10-20x, using short messages mixed with other ideas. Space them apart by a few days to maintain curiosity and give time for the idea to sink in.

- *Connect your concept* to other ideas that are already understood by the audience. Disney's team struggled with the concept for the Lion King movie until they framed it as "Hamlet in a Savannah setting"—to convey the idea of family feud amongst lions.

Moderate your approach. If you push a radical idea directly, people will resist; yet if you tone it down too much, it may lose its impact. To succeed, you must be willing to temper your idea and present it in a way that appeals to the mainstream audience.

- *Reframe your idea* in terms of values or beliefs that others already hold, or show how your idea supports their goals. When pushing for women's voting rights, Frances Willard didn't argue for societal reform or justice. Instead, she appealed to gender-role stereotypes by calling it a "home protection ballot" for conservative women to protect their homes from alcohol abuse.

- *Focus on "how"* instead of "why", to shift the attention from differences in convictions to gaps that can be filled. In 2011, Meredith Perry sought to create wireless power chargers by converting ultrasound vibration to power. All the experts insisted it was impossible. She stopped telling people what she wanted to create; instead, she got different experts to design different components (transmitter, receiver etc.) based on her specs, before putting them together. By 2014, she had completed her prototype and her company uBeam had secured 18 patents and $10mil of venture funds.

Seek out the right people. We tend to share our ideas with friendly people who'd agree with us. However, this means we may not get the critical feedback needed to hone our ideas. Seek the feedback and support of people who have a track record of challenging status quo, trying new ideas, and are willing to seek improvement over protection of status quo.

Build power and status. Power involves authority over others, while status involves having others' respect. You need both to effectively champion an idea.

KEY QUOTES

"If we want people to accept our original ideas, we need to speak up about them, then rinse and repeat."

"To draw allies into joining the cause itself, what's needed is a moderately tempered message that is neither too hot nor too cold, but just right."

"Status cannot be claimed; it has to be earned or granted."

- The ideas above can improve your chances of pitching a radical idea without jeopardizing your career. However, if your voice constantly falls on deaf ears, it may better to *exit the organization* and pursue your options elsewhere.

- For years, CIA analyst Carmen Medina tried to push for a classified internet platform for intel agencies to share intelligence. Her idea was shot down by everyone and she eventually left her job. Less than 10 years later, she played a vital role in the birth of *Intellipedia*, a Wikipedia equivalent for intel agencies. This time round, her work itself involved the internet and she changed the way she presented her ideas. This allowed her to build credibility while pushing her agenda without seeming to fight the status quo. She was also backed by a tough boss who was ready to make changes to improve the CIA.

Managing Emotions

Change triggers feelings like fear, doubt and anger. To see your ideas through, you need to manage your own emotions and overcome others' negative feelings toward change.

Both **optimism and pessimism** are useful coping strategies Pessimism can lead to despair, but can also help to mitigate risks.

- If you're feeling unsure, use "*strategic optimism*" to stay calm, set high expectations and expect the best, until you've rebuilt your confidence and commitment.

- Once you've settled into a specific course of action, use "*defensive pessimism*" to avoid complacency. Imagine everything that can go wrong and prepare thoroughly to minimize your risk.

When you're feeling anxious, you can **manage your fears** in 2 ways: by calming down, or by channeling the anxiety productively. Generally, it's easier to switch your emotional state from fear to excitement, than to try and calm yourself down. This is because:

KEY QUOTES

"In some circumstances, leaving a stifling organization can be a better path to originality."

"Rather than trying to suppress a strong emotion, it's easier to convert it into a different emotion—one that's equally intense, but propels us to step on the gas."

- When you're fearful, your body is pumped with adrenaline and in *"go" mode*. Thus, it's easier to tell yourself "I am excited" than "I am calm".

- Fear comes from *uncertainty* about the future. Since the future can also be positive, you have reason to be excited.

The best way to **inspire people** is to share a vision, then invite the customers or beneficiaries to share how this impacts them personally. This creates an emotional impact and makes the message seem more authentic. When University scholarship students called potential donors to describe how the donations could help them, they raised 3x the average amount of donations.

However, an inspiring vision alone is not enough. To motivate action, people must feel a **sense of urgency** to change *now*.

- The key is to leverage people's *loss-aversion*. Nobel Prize winner Daniel Kahneman found that people will prefer an option with a higher chance of a smaller gain, over an option with a lower chance of a bigger gain. When facing a potential loss, people will prefer to avoid the loss at all cost, even if it means risking an even bigger loss.

- Thus, if something seems risky, people will cling to status quo even if they see the potential benefits of change. You must show them what's wrong with the status quo and *emphasize what they'll lose* if they don't change. Make the gap between "what is" and "what it could be" as big as possible, and amplify their sense of frustration or anger.

- To *renew commitment and confidence* when people are wavering, focus on the investment and progress that's already been made and would be wasted if you give up. Once commitment is secured, look forward and focus on what needs to be done.

- On New Year's Eve of 2000, *Serbian political activist* Srdja Popovic and his friends organized a celebration in the Republic Square. Close to midnight, the square went dark and people began counting down. At midnight, instead of rock bands and performances, people were shocked to hear depressing music followed by an announcement that there

KEY QUOTES

"The leader's message provides an overarching vision to start the car, and the user's story offers an emotional appeal that step on the accelerator."

"The prospect of a certain loss brings the go system online."

was nothing to celebrate after a year of war and oppression. That night, Serbians went home with the message that 2000 was the year for change.

- To push for innovation, *Merck* CEO Kenneth Frazier asked leaders to generate ideas on what'd put Merck out of business. As the executives brainstormed challenges and defensive moves, they realized the risks and potential losses if they stuck to status quo; they were now ready to embrace innovation.

Channelling anger. Anger can drive us to take action, but such actions are unlikely to be effective.

- Studies in anger management found that *venting your anger* (e.g. by hitting a punching bag while thinking of the perpetrator) only feeds the anger and aggression. It's also stressful and exhausting to supress your feelings.

- A better response is to *focus on the victim*. This makes you more empathetic and allows you to channel your anger constructively, to help the victims rather than seek revenge or retaliation against the perpetrator.

- To manage potential *racial conflicts*, King ran workshops for thousands of black Alabamans to simulate abuse by "white passengers", with the goal of training participants to manage their anger so they wouldn't resort to violence and worsen the situation. King also urged victims to on freeing their own children and preserving their dignity, not on defeating the white men.

Creating and Maintaining Coalitions

When seeking support, we tend to look for groups/people who share common goals/beliefs. However, it may be better to seek those who share **common tactics**.

- *Common goals* don't always work because radical groups tend to adopt an extreme "all or nothing" view which makes it hard for other moderate groups to relate to them.

KEY QUOTES

"In seeking alliances with groups that share our values, we overlook the importance of sharing our strategic tactics."

- Instead, those who share the *same tactics* as us will tend to feel a sense of affinity even without the same values/ beliefs. For example, someone who participates in protest marches is likely to relate to another who's protesting for a different cause.

Work with your enemies, not frenemies. We tend to think most positively of our friends and most negatively of our enemies. We'd generally favor a frenemy (who swings between supporting and undermining us) over an enemy. However, when it comes to alliances, it may be better to cut off the frenemies and try to win over our enemies.

- Research found that predictably-negative relationships are *less stressful* than ambivalent ones that keep you second guessing.

- When you *convert someone* from negative to positive, they tend to be more motivated to maintain a positive relationship. They're also more effective in persuading others to join us, since they know others' concerns and appear more credible.

KEY QUOTES

Unleashing Originality at Work and at Home

Nurturing Originality in Children

Research shows that "laterborns" have a higher tendency to take risks due to sibling rivalry and parenting style. By adjusting how discipline is enforced, parents and teachers can influence how kids respond to rules and exercise originality.

Focus on values over rules. Parents of highly creative children tend to impose fewer rules and explain decisions based on principles and values like morality, respect, or perseverance.

- When children **understand the rationale** behind the rules, they're more likely to follow and internalize them. They're also more likely to develop empathy and be aware of the consequences of their actions.

- Be flexible if your children *challenge inconsistencies* in your rules and decisions; don't insist that they follow the rules blindly.

Role-modeling is a vital part of a child's development.

- Nurture creativity by exposing your children to *various role models*, such real-life stories of Originals, or even fictional characters who follow unconventional paths.

- Get your children to *consider different perspectives* by examining asking questions like, "what would this Original do in a situation like this?" or "how would things have turned out differently if he/she had grown up in a different culture?"

Reinforce good behaviors by associating them with good character. When children are praised for their character (e.g. being generous or kind), they are more likely to internalize it as part of their identity.

KEY QUOTES

"Reasoning does create a paradox: it leads both to more rule following and more rebelliousness."

"Role models have a foundational impact on how children grow up to express their originality."

"Character praise leaves a lasting imprint when identities are forming."

Cultivating Originality at the Workplace

One of the biggest enemies of originality is groupthink, i.e. the tendency to follow the majority instead of embracing diversity.

Build a **culture that promotes diversity** and creativity.

- *Bridgewater*—which handles some $170bil of investments—has a strong culture built on the principle that people must think for themselves. The commitment to think differently has allowed the company to identify trends and opportunities that no one else in the market has considered, and to avoid following erroneous market sentiments. Employees are expected to share their concerns and critiques of one another (including the leaders), and may even be fired for not speaking up.

- When hiring new staff, consider their *cultural contribution*, i.e. whether the staff adds to the diversity in backgrounds, skill sets, and personality traits. Conduct *entry interviews* to get new hires' suggestions, rather than do exit interviews only when people are leaving. Find creative ways to widen

"If you're going to build a strong culture, it's paramount to make diversity one of your core values."

"The greatest shapers don't stop at introducing originality into the world. They create cultures that unleash originality in others."

parents and teachers. In this summary, we've outlined several key examples and distilled the main insights and actionable tips.

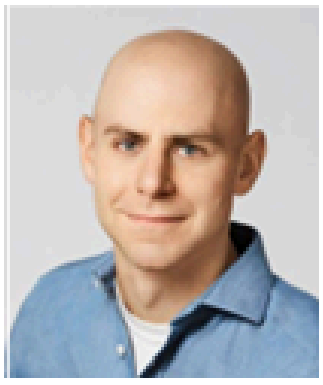
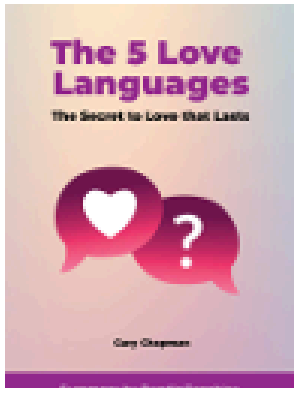
About the Author



Adam M. Grant (born 1981) is an American author and a professor at the Wharton School of the University of Pennsylvania. He received a B.A. from Harvard College, and M.S. and Ph.D. degrees from the University of Michigan in organizational psychology. At the age of 28, Grant became the youngest tenured professor in Wharton School's history.

In 2015, Grant was named a World Economic Forum Young Global Leader and a Thinkers50 Most Influential Global Management Thinker. He was also named to Fortune's 40 under 40 in 2016,

KEY QUOTES



THE 5 LOVE LANGUAGES

The Secret to Love that Lasts

Gary Chapman

The Big "So What"

Many marriages fail not because couples don't put in the effort, but because they are expressing their love in the "wrong" ways. When you learn to understand and speak your spouse's love language, you will be able to effectively express your love and truly feel loved in return.

Introduction

DIFFERENT LOVE LANGUAGES

Like linguistics in communication, people speak different love languages. We have our native love languages that we speak and understand best in, and our secondary language(s) that we are comfortable but less fluent at. It is possible for couples to love each other, but to feel unloved because they give and receive love differently, i.e. they don't share the same primary emotional love language. After 30 years of marriage counselling, Chapman concluded that there are 5 key emotional love languages, though there are many "dialects" within these 5 languages.

FILLING THE LOVE TANK

All of us have an "emotional love tank". When we receive love in our primary love language, our love tank is filled and we feel loved. When we don't receive love expressed in our primary love language, our love tank gradually depletes and we feel unloved. When our love tank is empty, issues is the relationship arise.

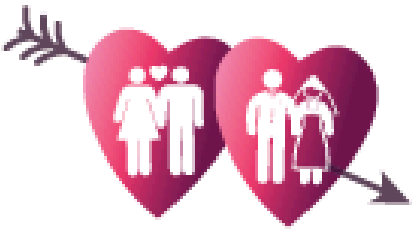
KEY QUOTES

"We must be willing to learn our spouse's primary love language if we are to be effective communicators of love."

"Once you identify and learn to speak your spouse's primary love language, I believe that you will have discovered the key to a long-lasting, loving marriage."

"At the heart of mankind's existence is the desire to be intimate and to be loved by another. Marriage is designed to meet that need for intimacy and love."

FALLING IN LOVE



When we fall in love, we feel euphoric. We have the illusion that our partners are perfect and that the romantic feelings in our relationship will last forever. During this in-love period, we feel altruistic toward each other. We give freely because we believe our lover feels the same about us, & are equally committed to meet our needs.

Long-range studies show that the in-love phenomenon typically lasts about 2 years (or longer if it is a secret love affair). When the phase eventually passes, we start to assert ourselves, and we stop doing many of the altruistic things for our partners. Our differences start to surface, and our partners' imperfections start to become irritating or annoying. As the love tanks start to deplete, relationship issues start to surface.

To have a lasting relationship, it is important to recognize that the emotional high of the in-love experience is only temporary in nature. After the phase has run its course, we need to make a conscious shift to "real love". Unlike the in-love stage, real love involves :

- A **conscious choice** or an act of will to love the other person;
- **Effort & discipline** to understand and give love to the other person (not merely driven by the euphoria of being "in love"); and
- A focus on **growth and development** of yourself and your partner (unlike the "in love" phase when we simply see the other party as perfect and hope they will stay that way).

We can choose to learn and speak our spouses' primary love language. When their love tanks are full, they are in a better position to reciprocate your love, and are free to grow to their full potential.

Love Language #1: Words of Affirmation

Words of affirmation are words that build someone up. If this is your primary love language, it means the world to you when you receive unsolicited compliments, hear the words "I love you" and the reasons behind that love. Insults can break your heart and leave lasting scars.

KEY QUOTES

"(Real love) is emotional in nature but not obsessional. It is a love that unites reason and emotion. It involves an act of the will and requires discipline, and it recognizes the need for personal growth."

"The in-love experience does not focus on our own growth nor on the growth and development of the other person…We are at the apex of life's happiness, and our only desire is to stay there."

"When we receive affirming words we are far more likely to be motivated to reciprocate and do something our spouse desires."

Verbal compliments

Sincere compliments can help your spouse to feel valued and appreciated: e.g. "You look beautiful today", "You look great in that suit," "I really love your cooking."

Encouraging Words

Your spouse may have areas of insecurity or untapped potential. Your words of encouragement inspire courage, and can be an important catalyst to help your spouse to take action to develop his/ her full potential. These could include:

- **Kind Words**, expressed with a loving tone of voice. This includes making a commitment to forgive each other for our past mistakes, and living each day free from the failures of yesterday.
- **Humble Words**, i.e. making humble requests, not demands, of each other. Recognize that we are equal, adult partners in marriage – when we make requests of our spouse, we affirm them of their abilities and their worth to us; when we make demands, we are belittling them.
- **Other Dialects** e.g.
  - Indirect words of affirmation: Praising your spouse when he/she is not around, or praising your spouse in front of others;
  - Sharing the credit for your accomplishments with your spouse; and
  - Written words of affirmation.

Love Language #2: Quality Time

If this is your primary language, you value doing things together & receiving full, undivided attention from your spouse, including sharing quality conversations and activities. Distractions, postponed dates, or not being listened to can be especially hurtful to you.

Quality conversations

Quality conversations involves sharing experiences, thoughts, feelings, desires etc. in a friendly and uninterrupted way.

- **Listen sympathetically and wholeheartedly**. To be a better listener:

KEY QUOTES

"Encouragement requires empathy and seeing the world from your spouse's perspective. We must first learn what is important to our spouse."

"Love doesn't keep a score of wrongs. Love doesn't bring up past failures....Forgiveness is the way of love."

"If we are to develop an intimate relationship, we need to know each other's desires. If we wish to love each other, we need to know what the other person wants."

- *Give your full attention*: Maintain eye contact, and focus on listening (don't do anything else during the conversation)
- Have a true desire to understand your spouse's thoughts, feelings and desires: *Listen for feelings, observe body language, and seek clarification if necessary*, to know what he/she is really thinking and feeling

- *Refuse to interrupt*

- **Learn to talk**: Self-revelation is not easy for many of us who grew up in homes where we are discouraged from expressing our thoughts and feelings (especially negative ones). We may have grown to deny our feelings over time.
  - *Learn to express your feelings*. Start by writing down your feelings associated with events away from home e.g. "no promotion – disappointed", "long queue – frustrated". Communicate these events and feelings briefly with your spouse, until you start to feel comfortable discussing your emotions about events within the home too.
  - *Establish new patterns of sharing*. Our natural inclination to share/ not share may be influenced by our personality types, but everyone can learn new communication patterns. To learn new patterns of sharing, set a daily sharing time in which each person will talk about 3 things that happened in the day and how you feel about them.

Quality activities

This can include anything in which either or both party has an interest in. The activity itself is less important than the objective of expressing love by being together. This may involve giving up some of your individual activities, but will go a long way to fill your spouse's love tank.

Love Language #3: Receiving Gifts

Gifts are visual symbols of love. If this is your primary language, you deeply treasure a gift or gesture that shows you are being thought of, cared for, and prized above whatever was sacrificed to bring you the gift. You feel hurt by the absence of daily gestures, a missed birthday, anniversary, or a hasty/ thoughtless gift.

KEY QUOTES

"If your spouse's primary love language is receiving gifts, you can become a proficient gift giver. In fact, it is one of the easiest love languages to learn."

Gifts can be purchased, found or made, and the value is often less important than the significance of the gift. If you are not intuitive at giving gifts but your spouse's primary language is receiving gifts, you can start by making a list of all the gifts that your spouse has been excited about – this will give you an idea of what gifts he/she appreciates.

Gifts and Money

If you have a saving and investing mentality, you may feel reluctant to spend money on gifts. Learn to view it as an investment in your spouse and relationship.

The Gift of Self

The gift of self (or the gift of physical presence) becomes especially critical in times of crisis if your spouses' primary love language is receiving gifts. If you are on the receiving end and want your spouse to be present physically, verbalize it rather than expect your spouse to read your mind.

KEY QUOTES

"Physical presence in the time of crisis is the most powerful gift you can give if your spouse's primary love language is receiving gifts."

Love Language #4: Acts of Service

If this is your primary love language, you feel loved when your spouse says "let me do that for you", and helps to ease your burdens or share your responsibilities e.g. cooking a meal, washing the car. Broken commitments, unwillingness to help, laziness/sloppiness, or taking your spouse for granted, all send the message that your spouse doesn't matter.

Even if you and your spouse share the same primary love language of Acts of Service, you make speak **different "dialects"** or value different types of support being rendered. Try asking your spouse to list down the tasks that he/she considers most important, and do them.

We should remember that our **perspectives and stereotypes** of male and female roles in society/the household may not be shared by our spouse. Hence, it's always better to make requests than demands. No spouse should ever feel compelled to do something for the other due to guilt or fear.

"Requests give direction to love, but demands stop the flow of love."

"Learning the love language of acts of service will require some of us to reexamine our stereotypes of the roles of husbands and wives."

Love Language #5: Physical Touch

Physical touch can bring a sense of security and connection to any relationship. If this is your primary love language, you crave shows of care and love through thoughtful touches, hugs, kisses, pats on the back, and/or sexual intercourse. Neglect or abuse can cause serious damage and hurt to you emotionally.

Dialects in Physical Touch

Like other love languages, there are **different dialects** in physical touch, such as loving touches on the arm/back/shoulders, a back rub, sexual foreplay and intercourse, sitting closely on the couch, holding hands etc.

Get feedback from your spouse to find out which what he/she finds loving and pleasurable. Even if you share the same love language of physical touch, don't assume he/she speaks the same dialect as you.

While **physical abuse** is inappropriate for any society or love language, it has an amplified impact for someone whose primary love language is physical touch. For example, a slap in the face or a spouse's infidelity can cause massive damage emotionally especially to someone whose love is expressed by physical touch.

If your spouse's primary love language is physical touch, holding him/her when he/she is crying or during crises is extremely powerful. On the contrary, the failure to touch could communicate indifference and leave a deep scar.

Discovering your Primary Love Language

To discover your primary love language, ask yourself:

- What makes you feel most loved by your spouse? What do you desire the most from your spouse?
- What does your spouse fail to do or say that hurts you deeply or brings you deepest pain?
- What do you do to express love to your spouse? [You tend to do what you wish he/she would do for you]

KEY QUOTES

"Physical touch can make or break a relationship. It can communicate hate or love."

"If your spouse's primary love language is physical touch, nothing is more important than holding her as she cries."

"Love doesn't erase the past, but it makes the future different. When we choose active expressions of love in the primary love language of our spouse, we create an emotional climate where we can deal with our past conflicts and failures."

The "Tank Check Game"

Use this game to develop your understanding of and stimulate the love expressions in your relationship:

- Write down what you think is your primary love language, then list the other 4 in order of importance. Also write down what you think is the primary love language of your spouse. Sit down and discuss your lists.
- For 3 times a week for 3 weeks, do a "Tank Check":
  - Ask "On a scale of 0-10, how is your love tank tonight?"
  - Then ask "What could I do to help fill it?" and do what your spouse requests to the best of your ability.
  - The top requests are likely to cluster around your primary love language.

Love is a Choice

We all come down from the emotional high of the in-love experience at some point. Most marriages fail because people have not learnt or chosen to speak the primary love language of the other party. With the love tank empty for some time, people start to fall in love with someone else.

Making a conscious choice and a deliberate effort to speak our spouse's primary love language may not come naturally for us. But it helps to keep his/her love tank full, and chances are that he/she will reciprocate and speak our language.

Love gives us the security, sense of significance & self-worth, and energy to develop our potential.

Turning things around

If you and your spouse's love tank have been empty for very long and you want a "miracle" to turn things around, consider this approach:

- Tell your spouse that you have been thinking about your marriage and want to do a better job of meeting his/her needs.
- Ask for suggestions on how you could improve, and be open to the feedback.
- If he/she has no suggestions, guess the primary love language based on the things he/she has been complaining about.
- Focus on speaking that love language for 6 months, and ask

KEY QUOTES

"When your spouse's emotional love tank is full and he feels secure in your love, the whole world looks bright and your spouse will move out to reach his highest potential in life."

"True love always liberates."

for feedback at the end of each month.

- Each time your spouse indicates he or she is seeing improvement, wait for 1 week before making a specific request of what you'd like him/her to do for you.

Love Languages and Children

The 5 love languages apply to children too. When children are little, we should pour all 5 love languages on them. As they grow up, observe their behaviours to learn their primary language.

- **Words of Affirmation**: We usually lavish young children with loving words and praises, but start to make demands and criticisms as they grow older. For a child whose primary love language is words of affirmation, such negative words could leave a long-lasting impact on their sense of self-worth and self-esteem. Instead, commend them for their successes and achievements.
- **Quality Time**: If your children's primary language is quality time, it is especially important for you get involved in their areas of interest and give them undivided attention in their younger years. Otherwise they will probably not allow you to spend time with them in their adolescent years.
- **Receiving Gifts**: If your child's primary love language is receiving gifts, he/she is likely to take care of the gifts, display them prominently, and play with them often. Observe what they value most and express your love through those gifts.
- **Acts of Service**: If your child often expresses appreciation for small acts of service that you do for him/her, and he/ she consistently offers to help you with projects and tasks, this is likely to be the primary language.
- **Physical Touch**: It is natural to hold and hug young children. As they grow up, don't withdraw such acts of affection. Remember that physical punishments can be especially hurtful emotionally to children with this love language.

KEY QUOTES

"Observe your children. Watch how they express love to others. That is a clue to their love language."

Other Useful Details in the Book to Look Out For

Chapman used many real-life examples from his own marriage, and of couples that he had counselled across the years, to illustrate the concepts in his book and how they can be applied to address different marriage/relationship issues and circumstances. These case studies help us to identify similarities and lessons for our own relationships.

In the book, he also offers 2 pages of additional ideas and suggestions for each of the 5 love languages, as well as separate love language profile surveys for husbands and wives (to identify your primary love language). More resources, including free online profiling surveys, are available at the official website.

About the Author

Dr Gary Demonte Chapman (born 1938) is an author and relationship counsellor. He is the director of Marriage and Family Life Consultants, Inc, and also hosts radio programs about marriage and relationships, airing on more than 400 stations. He speaks to thousands of couples through his weekend marriage conferences. He currently live in Winston-Salem, North Carolina, where he serves as senior associate pastor at Calvary Baptist Church.

Dr. Chapman holds BA and MA degrees in anthropology from Wheaton College and Wake Forest University, respectively, MRE and PhD degrees from Southwestern Baptist Theological Seminary, and has completed postgraduate work at the University of North Carolina and Duke University.

With the success of his first book *The Five Love Languages: How to Express Heartfelt Commitment to Your Mate*, he has expanded his *Five Love Languages* series to reach out specifically to singles, men, and parents of teens and young children. He also

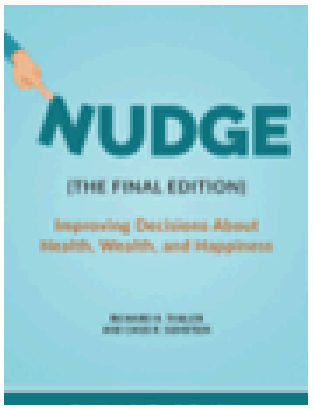
KEY QUOTES



NUDGE (The Final Edition)

Improving Decisions About
Health, Wealth, and Happiness

RICHARD H. THALER AND CASS R. SUNSTEIN

The Big "So What"

Our behaviors can be influenced by seemingly small but insignificant nudges. This book explains key behavioral economics principles and how nudges can be used to address a range of outcomes at individual, national and global levels.

Introduction

First published in 2008, *Nudge* popularized the concept of using behavioral sciences in public policy and managerial practices. This Final Edition includes additional materials, updated examples, and recommendations for policy-makers to design systems that can generate an even more positive impact. In this summary, we've distilled and organized the key insights into 3 main parts:

- Behavioral economics, choice architecture and nudges
- Nudges to improve financial well-being
- Nudges to serve the wider good

Part 1: Behavioral Economics, Choice Architecture and Nudges

Key Behavioral Economics Concepts

Traditional economics assumes that humans are rational beings who make optimal decisions to maximize their utility. In reality, humans frequently make poor decisions due to cognitive flaws, emotional impulses, lack of information or self-control.

KEY QUOTES

"Apparently insignificant details can have major impacts on people's behavior."

"People are...nudge-able. Their choices, even in life's most important decisions, are influenced in ways that would not be anticipated in a standard economic framework."

Behavioral Economics blends economics and psychology to help us understand why people behave the way they do in the real world.

Renowned economist and psychologist Daniel Kahneman explained that we think using 2 cognitive systems:

- The *Automatic System* is fast, instinctive, effortless, and associative. It allows us to make countless decisions daily without conscious thought.
- The *Reflective System* is slow, deliberate, effortful, and deductive. This is the conscious, deliberate process that we associate with "thinking".

Our brain uses a range of heuristics or mental shortcuts to make decisions quickly. However, they also lead to biases and blunders. Key heuristics include:

- *Anchoring*: We rely on an existing piece of information (an "anchor") to gauge something else. When college students were asked "How happy are you?" followed by "How often are you dating?", the correlation between the answers was low. However, the correlation increased when the question sequence was reversed, i.e. the students' perceived happiness became tied to their dating frequency.
- *Availability*: We over-estimate things that we've experienced personally, or things that are recent and vivid.
  (i) For example, you'll likely overestimate the risks of nuclear power accidents and underestimate the risk of strokes.
  (ii) You can encourage caution by reminding people of a similar incident where things went wrong. To increase confidence, remind them of a similar incident where things went well.
- *Representativeness*: To assess if A is similar to B (or if is A is part of category B), we think in terms of our stereotype of category B.
- We tend to be *overconfident and overly optimistic*. 90% of drivers and 94% of professors think they're above-average. Most entrepreneurs also overestimate their chances of business success.

KEY QUOTES

- *Loss-aversion*: You're likely to be 2x more upset at the prospect of losing something, compared to the joy of gaining the same thing.

  (i) In a study, students were given a mug then asked to sell it. They quoted 2x the price compared to other students who were simply asked how much they would pay to buy a mug.

  (ii) You're more likely to switch to a new payment plan if you're told "You'll lose $500 a year if you don't switch" than "You'll save $500 a year if you switch.

- We favor the *status quo* due to loss aversion and a lack of attention. Once you subscribe to a magazine or start watching a TV series, you're like to continue.

We also make bad decisions due to a lack of self-control, i.e. we give in to temptation and mindlessness. You may want to go for a run but end up watching TV.

- One of the best ways to *resist temptation* is to take preventive action when you're in a low state of arousal, e.g. lock up the TV control in an inaccessible drawer. That way, you use your Reflective System to counter your Automatic System.

Our decisions are strongly affected by social influences:

- We tend to *conform* to group norms because of peer pressure and explicit/implied information about what's good for us (or what we should do).

  (i) Various studies found that 20-40% of participants will choose an obviously-wrong answer if everyone else in the room does so. They conform because they think that (a) if everyone agrees on something then it's probably right, and (b) others may disapprove if they give a different answer.

  (ii) Conformity is the highest in small groups where responses are made public. It drops significantly if people can respond anonymously. We're more likely to conform if others appear confident or authoritative.

- We're also *influenced by others' choices*, e.g. we may eat the same types of food as our friends, or buy products with the highest reviews. One person's opinion can influence the

KEY QUOTES

"Unrealistic optimism is a pervasive feature of human life."

"People do not assign specific values to objects; it often matters whether they are selling or buying."

"Exploitation of behavioral biases can be a winning strategy."

"Once a practice (like wearing ties) has become established, it is likely to be perpetuated, even if there is no particular basis for it."

the next person's opinion and so on, until the whole group expresses the same view. This is known as an "informational cascade."

- *Identity*: We may adopt behaviors of people we identify with (e.g. similar religion, ethnicity, or nationality), and avoid behaviors of people we don't identify with.

  (i) India successfully promoted public health by highlighting Mahatma Gandhi's commitment to cleanliness.

  (ii) Participants in a study were grouped based on their identification with Democrats vs Republicans. Some were asked to independently indicate their views on issues, while others were told the opposing party's views before being asked for their views. The 2nd group invariably chose the opposite viewpoint from their adversaries'.

- We may follow a practice or tradition just because we wrongly believe that's what our community wants. This is called *pluralistic ignorance*. Once someone starts to speak up against the practice, others may feel empowered to speak up too.

- In short, humans naturally make mistakes and bad decisions. It's possible to use *nudges* to help people make better decisions while retaining their freedom of choice. A nudge refers to anything that shifts people's behavior in a predictable way, without the use of drastic disincentives (e.g. fines or bans). For example, you can nudge students to eat healthier foods just by changing the layout of the stalls in a cafeteria.

Libertarian Paternalism

The question is: which direction should you nudge people toward? The authors propose Libertarian Paternalism as the ideal approach.

- It combines *libertarianism* (giving the freedom of choice) and *paternalism* (influencing people to act in ways that make their lives better, as defined by them). In short, you're helping people to make the choices they would've made if they had perfect information, attention, self-control, and no biases.

KEY QUOTES

"If people wrongly think that most people are committed to a long-standing social norm, a small nudge correcting that misperception can inaugurate large-scale change."

- The *golden rule* is to offer nudges which are the most likely to help and the least likely to inflict harm.

Most critics of Libertarian Paternalism are Libertarians (who prefer to maximize choice and freedom) or Paternalists (who believe in setting limits for people's own good). In the book, the authors use various studies and examples to lay out 3 fundamental concepts:

- *There's no such thing as a "neutral" design*. Everything—from a website to an office layout—has a design that nudges people in some way.

- *More choices may not mean better outcomes* since we don't always choose wisely. At times, we also prefer *not* to choose, e.g. when we ask for recommendations at a restaurant.

- *Paternalism ≠ coercion*. Nudges are about influencing behaviors without harsh laws or prohibitions.

Nudges are the most useful in these situations:

- Choices that require *memory*. All of us space out or forget things. Shopping lists, to-do lists, calendar apps, and checklists are all useful nudges/tools to help us remember what's important.

- *Choices with delayed effects*. It's harder to exert self-control if the consequences occur much later, e.g. binge-eating or smoking.

- The more you do something, the easier and more automatic it becomes. Thus, you're more likely to need help with choices that are *difficult or infrequent*.

- To learn effectively, you need clear and immediate feedback. It's hard to make good choices if there's *poor feedback*, or if you can't imagine the outcome from a decision. For instance, you may not see how a high-fat meal may lead to a heart attack, or imagine what a foreign dish may taste like.

Nudges can be used by both government and private institutions, though they're the most impactful in public policies and regulations.

KEY QUOTES

"Whenever we engage in directional nudging, we should be confident that we are likely to make people better off, as judged by them."

"Difficult and rare choices are good candidates for nudges."

Tools for Choice Architects

Great design should appeal to our Automatic System. You'll intuitively push a door with a flat plate, but pull the door if there's a protruding handle (even if the sign says "push"). Or, you'll probably stop if you see a red sign that says "go".

Defaults are one of the best forms of nudges.

- Make the desired steps *easy and effortless*. People naturally choose the option that requires the least effort, then stick to the status quo. However, if they clearly dislike the default, they'll still take steps to change it.

- We're surrounded by defaults that make our lives better and safer, such as timed screensavers on our computers, or chainsaws that switch off automatically when they're not in use. You can use *2 types of defaults*:

  (i) *Prompted choice*: Default settings with an opt-out option

  (ii) *Active choice*: Forcing people to make an explicit choice.

- *Cater for expected errors*. For example, automobiles come with reminders to buckle your seatbelt and warnings when you drift out of your lane. The nozzles for diesel fuel are designed to be too big for the fuel tanks of gasoline cars.

Give feedback to show if things are going right or wrong, e.g. an alert when the battery level is low, or a progress bar that shows the level of completion.

Use maps to show the relationship between people's current choices and long-term welfare, so they can make better decisions.

It's easy to choose between few simple options (e.g. ice-cream flavors), but hard to compare complex options (e.g. medical treatments or retirement plans). To simplify complex choices:

- Use *self-nudges* or snudges, e.g. limit the amount of junk food at home, or program your laptop to block emails at certain hours.

- Use *filters* (e.g. setting a maximum budget or distance) to eliminate unsuitable options.

KEY QUOTES

"Design is not just what it looks like and feels like. Design is how it works."
—Steve Jobs

"Choice architects can make major improvements to the lives of others by designing user-friendly environments."

"For most of us, life can be improved via well-chosen snudges."

Prices and incentives both affect decision-making.

- When designing incentives, consider *4 questions*: (i) Who chooses? (ii) Who uses? (iii) Who pays? and (iv) Who profits? When the answers for the first 3 questions are the same, markets can work relatively well so long as people have enough information and can use them objectively. The situation gets complex when multiple stakeholders are involved. For example, the U.S. has one of the most expensive healthcare systems because patient services are often chosen by the physician, paid for by the company or government, and the revenue is shared among various suppliers and workers.

- In general, people consume less when prices go up. However, we may not notice price increases (especially if someone else is paying), opportunity costs or hidden/indirect costs. By *making gains and losses visible*, you can facilitate better choices.

Smart disclosures mean providing complex information in a standardized, machine-readable format so it's easier for users to compare options.

- Use *standardized units of measurement* for meaningful comparisons.

- If there are multiple metrics or a non-linear relationship between metrics and outcomes, mandate *standard contracts* where:

  (i) The *default terms* in fine print are standardized (e.g. deposit amounts and termination terms for housing rent); and

  (ii) Any *deviations* must be stated clearly in the main contract.

- Make the disclosures *machine-readable* so choice engines (like Expedia or Kayak) can be developed to help users compare options easily.

- *Let customers own their usage data*. Any organization that tracks users' purchase or consumption patterns should also make the data available to the users. For example, energy suppliers in the UK must now provide customers with usage data in a machine-readable format. By scanning their bills, customers can see a list of energy deals that suit their usage habits.

KEY QUOTES

"It is not only possible to design choice architecture to make people better off; in many cases, it is easy to do so."

Social influences can be powerful nudges.

- You can shift perceptions just by *sharing truthful information* about what others are thinking or doing. In Saudi Arabia, husbands can decide whether their wives are allowed to work outside the home. In a private poll, economist Leonardo Bursztyn found that many young men were in favor of female participation in the workforce, but kept silent as they thought others were against it. Once they knew about other men's true opinions, they became more likely to authorize their wives to work.

- For many years, *same-sex marriage* was denied in most countries. Yet, after Netherlands acknowledged it legally in 2001, many countries followed suit within the next 2 decades. This could be due to (i) the increasing number of gays and lesbians disclosing their sexual orientation, and (ii) the cascading effect as more individuals and countries expressed their support for same-sex marriage.

You can even influence behavior by offering well-curated options or making things fun, enjoyable, exciting or mysterious. Volkswagen got more people to take the steps by converting the stairs at the Stockholm subway station into a musical instrument. Taipei used a lottery to get dog owners to deposit dog waste at a special location.

Removing Sludge

The ultimate goal of choice architecture is to make it easy for users to make good decisions. Nudges help them to do so while sludge does the opposite, creating friction to make it harder for people to get a better outcome (as defined by them).

Sludge may come from red tape or be added intentionally to deter people from certain actions. Common types of sludge include:

- Making it hard for people to cancel their *paid subscriptions*. Sludge exists so long as the methods for unsubscribing are harder (e.g. having to make a long-distance call) than the methods for subscribing (e.g. entering your credit card details online).

- Making it hard for people to redeem a *coupon or rebate*.

KEY QUOTES

"Make it fun. And if you don't know what fun is, then you are not having enough of it."

"In many cases, sludge operates as a wall, and people cannot find a way to get over it."

- *Lack of transparency*, including hidden costs/discounts. Printer manufacturers are known to sell their printers cheaply then making money from the expensive ink. Some companies also reserve discounted prices only for customers who complain or intend to leave, which is a form of discrimination via sludge.

Sludge represents real costs to users, organizations and governments. Complex processes and paperwork also block people from the assistance or support they require.

- The *U.S. tax system* is a classic example of sludge.

  (i) As of 2019, Form 1040 alone has 108 pages of instructions. The average American spends 13 hours on the 1040, and many pay professionals to prepare their tax returns. This is sharply contrasted with countries like Sweden where 80% of taxpayers can file their tax returns in minutes on their mobile phones.

  (ii) The Internal Revenue Service (IRS) can easily pre-fill the tax forms since they already have the income figures and tax benefits that people qualify for. Tax filers can then make adjustments to the pre-populated forms if necessary, saving the government and taxpayers billions of hours each year. Yet, the Congress explicitly forbade this fuss-free process due to lobbying by tax preparation companies (which were profiting from the sludge).

- Red tape can also be found in private institutions, e.g. approvals or reimbursements for *work-related expenses*. Companies that insist on choosing the lowest airfares fail to consider the costs of inconvenient flight hours and schedule inflexibility.

There are many ways to de-sludge. For instance, the University of Texas removed the need for unnecessary paperwork by automatically admitting all students in the top 6% of their high school class. Start by reducing the sludge that you create for yourself and others. If people aren't doing what they should, look for sludge that can be removed.

KEY QUOTES

"The costs governments impose on their citizens via sludge are often neglected in the design and evaluation of policies."

"A sludge-reduction effort would pay big dividends."

Part 2: Nudges to Improve Financial Well-being

Saving for Retirement

It's hard to save for retirement since (i) we must evaluate complex options, (ii) we're more loss-averse than pro-gain, (iii) the rewards come much later, and (iv) we must overcome inertia. This is where choice architecture comes in.

Traditional social security plans rely on the working population to support the retired. This is no longer viable as people live longer, have fewer children, and the worker-to-retiree ratio decreases. Thus, governments have had to rethink their retirement schemes.

- In the *U.S.*, the 401(k) was created in 1978. This is a defined-contribution plan where employees can contribute to a tax-sheltered account, and employers will match 50% of employees' contributions (up to a limit). Employees can then choose how the money is to be used toward their retirement.

- The *UK* created the National Employment Savings Trust (NEST) in 2008. All employers who don't offer a retirement plan must automatically enroll their employees into NEST (with an option to opt out). Both employers and employees make contributions and can choose from a range of investment options.

- *Sweden* has a mandatory social security tax, and part of this tax was set aside for a pension plan since 2000. Participants can choose up to 5 funds from a list of approved funds. A default fund (AP7) is assigned for those who don't make an active choice.

We can gain many insights from the Swedish example. The plan was "pro-choice", allowing any fund that met fiduciary standards to be added to the approved list. When the plan was first launched, the government advertised heavily to encourage people to choose their own portfolio. Funds were also allowed to advertise.

- The massive government and private-sector advertising worked. Two-thirds of the initial 4.4 mil participants became

KEY QUOTES

"We don't expect people to be their own physicians; why should we require them to make other complex decisions if there are trusted experts who can do it better, and on whom they can freely choose to rely?"

Active Choosers, i.e. they chose their own portfolio. The rest accepted the default fund. However, once the ads stopped, the proportion of new Active Choosers also fell rapidly, dropping to 9% in 2003, 3% in 2010, and less than 1% in recent years.

- Unfortunately, *more choices* did not lead to better outcomes.

  (i) There were hundreds of approved funds (>900 at one point), making it *overwhelming* for investors to compare the options.

  (ii) Most Active Choosers *didn't choose wisely*. Private sector ads were influencing people to buy portfolios with higher risks, higher fees and lower expected returns. 96% of Active Choosers ended up investing more heavily in stocks, putting almost half their money in Swedish companies, and paying more than 4x higher fees than the default fund.

- Default rules/options can be very sticky when people are in autopilot mode, and the system showed *inertia* at several levels.

  (i) After choosing their initial portfolio, most participants didn't *update their portfolios*. Even when one of the funds was investigated for fraud and investors had the option to shift their money out at no cost, only a small proportion did so.

  (ii) After a major change in 2010, the default fund became *much riskier*, yet few investors took up the option to switch funds for free.

  (iii) Despite the sub-optimal outcomes, policymakers *didn't fundamentally rethink* the plan's structure. They merely reduced the number of approved funds to <500.

- The authors recommend the following *improvements*:

  (i) Drastically *reduce the number of funds* to simplify choice.

  (ii) Encourage investors to *start over* once in a while so they can reconsider bad choices made in the past. Concurrently choose a default option for people who won't do the "reset".

KEY QUOTES

"In outer space, an object that has been nudged will keep going in that direction until it is nudged again."

"Just as you should regularly reboot your computer, we think it is healthy for investors to be encouraged occasionally...just to start over."

(iii) Do *not* allow default funds to be leveraged (i.e. borrow to buy stocks). This increases the investment risks and should be explicitly opted-in, not set as a default.

When it comes to nudges for retirement savings, governments should consider 3 aspects:

- To *increase enrollment*, consider using defaults to automatically enroll employees into retirement plans (with opt-out options), instead of asking them to opt in.
- A good plan should help people to achieve a *higher saving rate*. One solution is to get participants to increase their contributions automatically, e.g. increase by 1% per year or when their salaries increase.
- *Improve investment returns* while ensuring the default savings plan is relatively low-risk, such as a balanced fund with a mix of stocks and bonds.

Managing Debt

With easily-available credit, it's tempting to spend more than we have. The U.S. alone has >$1 trillion in credit card debt and >$15 trillion in mortgage loans.

It's ok to use credit cards so long as you pay the full bill each month. Otherwise, the outstanding payments can compound into huge debts.

- To *protect consumers*, governments can:

  (i) Mandate *proper disclosures*, including the consequences of making only minimum payments. Get all credit card fees and rules listed in an online database for easy comparison.

  (ii) Regulate the use of *overdraft arrangements* which allow people to borrow money automatically at high interest rates.

Mortgages are also fine if you pay your regular instalments.

- Unfortunately, mortgages come with *complex options* such as fixed vs variable interest rates, extra fees and penalties. Consumers may get lured in by "teaser" rates that increase dramatically after 1-2 years.

KEY QUOTES

"Every country should be thinking hard about how to identify [a system] that suits the needs of its citizens."

"Choosing is more important for mortgages, but using is more important for credit cards."

- Customers may also be exploited by *unscrupulous advisors* who recommend mortgage options with higher commissions (instead of what's in the clients' interest).

- Governments can *protect consumers* with any of these 3 options:

  (i) Mandate mortgage providers to make fees and costs *transparent*, e.g. summarize the costs on 1 page and combine them into a single interest rate for easy comparison.

  (ii) Have a few types of *standard mortgage contracts* (e.g. fixed vs variable rates, for 15 or 30 years each), with standard fine prints for each type of contract. All harmful practices (e.g. easer rates) should be highlighted or banned.

  (iii) Create an *online database* where borrowers can get mortgage recommendations based on their profile and parameters.

KEY QUOTES

"A market for advice does not guarantee that the advice will be good."

Insuring What Matters

The ultimate goal of insurance is to protect against financial ruin from rare but major disasters, such as critical illnesses or a fire destroying your home.

- People often make *sub-optimal decisions*, e.g. paying $10 extended warranty for a $100 toaster, or choosing lower deductibles with higher premiums. When a company allowed employees to customize their own healthcare programs, people ended up paying 28% more for the same coverage.

- As a rule of thumb for insurance, go for the *largest available deductible* since these will give the biggest savings in premiums.

Research shows that patients who must pay for some or all of their medications end up cutting back on all types of drugs—including the life-saving ones. By saving money on prescribed medications in the short-term, they end up incurring higher costs in long-term medical emergencies. So, encourage

employees (especially low-income earners) to take up high-deductible plans instead of trying to get them to share the medical costs.

Part 3: Nudges for the Wider Good

Organ Donations

Eric Johnson and Dan Goldstein found that organ donation consent rates were significantly higher (97.6% on average) in countries where it was the default option, compared to countries where people had to opt in (15.2% on average). However, the authors believe that default opt-ins are not the ideal solution for organ donations.

- That's because there are *3 groups of stakeholders*: (i) Patients who need (or will need) an organ to live, (ii) Potential Donors who're close to death and can choose to donate their organs, and (iii) Families of Potential Donors who've died.

- While the primary *goal* of organ donation is to save more Patient lives, it's also important to respect the rights and preferences of Potential Donors and their Families.

There are several possible approaches to organ donation:

- *Routine removal* means the state can remove the organs of someone who's dead without asking for permission. Yet, of the 50 countries studied, none did so (probably due to the sensitivity of the issue).

- *Presumed consent* means you assume that people agree to donate their organs unless they explicitly opt-out. However, this only makes sense if people are aware of the policy and there's minimal sludge to opting out. In most cases, Families are still consulted on whether to honor the deceased's wishes—this is cruel as the families are coping with their loss and may not know what the deceased wanted.

- Other options involve explicit *opt-ins*. *Explicit consent* means that you must take specific steps to opt in as a donor, while *mandated choice* means it's compulsory for everyone to choose. So far, there's no evidence that presumed consent

KEY QUOTES

"Although defaults can be a powerful tool, changing the default is not the answer to every problem."

leads to more donations than opt-ins. The authors recommend using *prompted choice* with 3 steps:

(i) Make it easy to register online (e.g. donatelife.net);

(ii) Get people to opt in willingly when you have their attention, e.g. when they're renewing their driver's license or filing their tax returns; and

(iii) Make sure their wishes are honored.

- Experiment with various ways to get people to opt in. You can also augment the system with *incentives*:

(i) In Singapore, anyone can opt out, but they'll get pushed to the bottom of the waitlist if they ever need a donor.

(ii) In Israel, donors must opt-in and the next-of-kin must still make the ultimate decision. To encourage both parties to say "yes", the regulations were changed in 2008 as follows:

- You get priority if you're registered a Potential Donor ≥3 years before you become a Patient; and
- You get even higher priority if your first-degree relatives had donated their organs when they died.

KEY QUOTES

"A primary function of prompted choice is overcoming procrastination, inertia, and limited attention."

Climate Change

Climate change is a real and complex challenge. For simplicity, the authors focused primarily on the challenge of reducing emissions. Behavioral economics help us to understand why so little has been done to date.

- *Present bias*: While we're starting to feel the effects of climate change, any action today will only bring results decades later.
- *Salience*: Pollutants like greenhouse gases are invisible (unlike dirty water or smog) and hence largely ignored.
- Climate change comes from the cumulative actions of billions of people worldwide over time. There's *no specific villain* to target, making it harder to mobilize collective action.

"If you can't even see them, you might not worry about them."

- We *can't prove* that climate change causes the increase in hurricanes, blizzards, etc. We can only show a correlation.

- Solutions to climate change involve behavioral change, which triggers *loss-aversion and status quo bias*.

- There's a *lack of feedback* between our daily actions and their impact. When you're driving your car or enjoying the aircon, you're unlikely to consider the impact of gas emissions on the environment.

- People/nations are reluctant to reduce emissions when their efforts can be negated by others who continue to increase emissions, i.e. there's a problem of *free-riding*.

Nudges alone cannot solve the climate change problem. The authors recommend an "all tools on deck" approach with a mix of regulations, incentives, penalties, and interventions.

- Generally, people are willing to contribute to a common resource if everyone else does. But, we'll stop if there's free-riding. The only way to gain cooperation is through *coordinated action* by governments around the world. The Paris Agreement (which came into effect in 2016) is a first step forward, as nations agree to determine their mutual contributions and reduce the required emissions in their own territories.

- It's crucial to provide *incentives* that're aligned with the common goal. So far, 2 approaches have been proposed:

  (i) Imposing *penalties/taxes* on those who pollute (e.g. tax on greenhouse gas emissions). This motivates polluters to adjust their practices, and generates revenue for governments to support innovations like solar energy systems or electric cars.

  (ii) A *cap-and-trade system* sets a limit for each party's level of emissions while allowing them to trade their "rights" to pollute. This allows the market to set the price for pollution. The key challenge is determining the caps to be allocated in the first place.

- *Use feedback and information* as drivers for change.

  (i) The creation of the Toxics Release Inventory in the 1980s led to a huge drop in toxic releases throughout the USA. Individuals and firms were required to report the

KEY QUOTES

potentially-hazardous chemicals they stored/released and the potential health impact. Once the data was made available online, companies were motivated to adjust their practices to avoid bad publicity. Governments worldwide can create similar *inventories* for greenhouse gases and other pollutants.

(ii) The costs of pollution may be invisible, but our petrol and utility bills are not. Use transparency to help people know much energy they're using and how it compares with others' usage. Such *information* can be easily included in the monthly bills.

"Sometimes, information can be a surprisingly strong motivator."

- *Default to green*. Governments can automatically enroll households with a green energy provider, but give them the option to switch out. They can even change the building codes to ensure all new homes/buildings are energy-efficient. The long-term cost savings will justify the higher construction costs.

"If the goal is to make it really easy, make it automatic."

KEY QUOTES

Conclusion and Other Details in the Book

In a nutshell, active choosing isn't viable in every situation, nor will it always bring the best outcomes. It's better to concurrently nudge and educate people using a mix of smart disclosures, personalized defaults, easy-to-compare options, and effective choice engines.

"Active choosing is often a good idea, but in many domains, curation and well-designed defaults are a blessing."

- Yet, nudges alone cannot solve all problems. At times, *additional incentives, mandates and bans* may be necessary to prevent direct harm to others (e.g. murder, rape, theft or assault) or to address complex issues like climate change.

- The key is to weigh the benefits for those who're helped versus the costs to those who're not. Then, evaluate if the *nett benefits* justify the new laws or mandates.

A libertarian paternalistic approach is about guiding people toward better choices as defined by them. However, choice architects are not infallible. They make mistakes, have biases and information gaps, and may not always act in the best interest of their users/clients.

"All choice architects are fallible, and some are even malicious."

- That's why it's better to nudge people in a certain direction, yet *preserve their freedom* to make the final choice. For example, you can warn consumers that a product contains food allergens without banning it. You can set a printer to do double-sided prints by default without preventing single-sided prints.

- An *ideal nudge* should work like a GPS—to recommend possible routes then let users decide whether to heed the advice. Defaults and opt-out options should be transparent and easy, not sneaky or sludgy. Apply John Rawls' publicity principle: to take only actions that you can/will defend publicly.

This book is filled with detailed examples, case studies and statistics to illustrate the complexity, nuances and applications of behavioral economics in the real world. Each of the examples in this summary are discussed at length in the book, along with additional examples including aviation security, GDPR, education and financial assistance. For more details and information, do visit the authors' blog at nudges.wordpress.com or nudges.org.

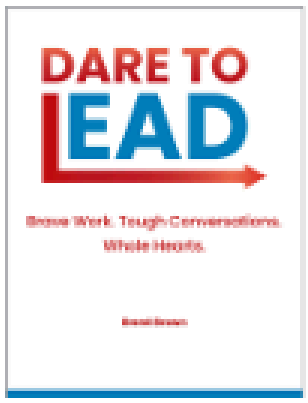
KEY QUOTES

"Nudges are generally designed to help people find the right means to their own ends."

"By properly deploying both incentives and nudges, we can improve our ability to improve people's lives, and help solve many of society's major problems. And we can do so while still insisting on everyone's freedom to choose."

About the Author

Richard H. Thaler (born 1945) is an American economist and the Charles R. Walgreen Distinguished Service Professor of Behavioral Science and Economics at the University of Chicago Booth School of Business. In 2017, he was awarded the Nobel Memorial Prize in Economic Sciences for his contributions to behavioral economics. He was the president of the American Economic Association in 2015, and was elected a member in the National Academy of Sciences in 2018. Thaler holds a B.A. degree from Case Western Reserve University, and an M.A. and Ph.D. degree from the University of Rochester.



DARE TO LEAD

Brave Work. Tough Conversations.
Whole Hearts.

BRENÉ BROWN

The Big "So What"

To succeed in a complex and fluid world, organizations need brave leaders and courageous cultures. In this book, Brown presents the 4 courage-building skill sets that can be nurtured in any individual and organization.

Brave leadership and Courageous Cultures

In any organization, the fear of failure and shame can lead people to hold back ideas, avoid risks and tough conversations. This stifles learning and creativity to hinder success in a world that demands continuous innovation.

Based on 2 decades of research and real-life experience, Brown found the **antidote to fear and shame**—brave leaders who are willing and able to face uncertainty and vulnerability head-on, and teach their teams to do the same.

- This book combines insights from Brown's previous books (including *The Gifts of Imperfection*, *Daring Greatly*, and *Rising Strong*) with her latest findings, to explain how you can become a daring leader. Specifically, there are 4 *courage-building skills* that can be learned and taught.

Skill #1: Rumbling with Vulnerability

To build courage, you must first learn to face your vulnerability.

KEY QUOTES

"Courage is a collection of four skill sets that can be taught, observed, and measured."

"What stands in the way becomes the way."
—Marcus Aurelius

- *Vulnerability* is the feeling we get when we face uncertainty and the risk of emotional hurt. A *rumble* is a conversation where people allow themselves to be vulnerable so as to serve a higher mission and one another (instead of hiding behind masks and armor to protect themselves and their self-interests).

- "*Rumbling with Vulnerability*" is at the core of daring leadership. You can't build an innovative culture without exposing yourself to risks and failures. So, it's crucial to face your fears and discomfort.

What Vulnerability Is and Isn't

Brown dispels 6 myths about vulnerability (expanded from the original 4 myths in the book *Daring Greatly*):

- *Myth #1: Vulnerability = weakness*. Vulnerability makes us anxious but it's not a sign of weakness. It takes courage to face your vulnerabilities. Real courage is about showing up even if it puts you in a vulnerable position, e.g. admitting a mistake, trying for another child after a miscarriage.

- *Myth #2: "I don't do vulnerability."* Risks and uncertainty are unavoidable. When you pretend they don't exist, it allows your fears to drive you unconsciously.

- *Myth #3: "I can go it alone."* Human beings are social creatures. We're biologically wired for connection and empathy, and you can't build meaningful relationships without vulnerability.

- *Myth #4: You can engineer away the uncertainty/ discomfort*. Unlike system vulnerability, you can't avoid or eliminate relational vulnerability. You can only learn the skills to manage it.

- *Myth #5: Trust must come before vulnerability*. Trust isn't built from big heroic acts, but small daily exchanges, e.g. paying attention to small things about each other, or showing genuine concern. Trust and vulnerability go hand-in-hand and can't be separated.

KEY QUOTES

"You can't get to courage without rumbling with vulnerability. Embrace the suck."

"The courage to be vulnerable is not about winning or losing, it's about the courage to show up when you can't predict or control the outcome."

"You can do vulnerability, or it can do you."

"We need to trust to be vulnerable, and we need to be vulnerable in order to build trust."

- *Myth #6: Vulnerability = disclosure*. Vulnerability is not the same as emotional purging or disclosing sensitive information. To rumble with vulnerability, you need to set boundaries and create psychological safety: acknowledge that problems/uncertainties exist, talk openly about the emotions surrounding those risks, listen to people's questions/concerns, and create a safe space for people to work through the issues.

The Square Squad. We need feedback to grow. Yet, we shouldn't worry about every single criticism we get. The key is to get solicit feedback only from people who truly matter, and let go of the rest.

- On a small piece of paper (1x1 inch), list down the handful of *people whose opinions truly matter*. These should be people who love you as you are (including your vulnerabilities and imperfections), and are able/willing to rumble with you.

- Keep this list (*your square squad*) with you. Take 10 mins to let them know you're grateful that they care enough to be authentic and honest with you.

Have the Courage to Serve

To serve their people, leaders must have the courage to address uncomfortable issues. In her first year of command at the Air Force, Colonel Dede Halfhill was asked a tough question—whether the pace of operations could be slowed down because the airmen were feeling tired. She knew that the real issue wasn't about physical fatigue, so she took the opportunity to share about a study that found exhaustion to be a manifestation of high levels of loneliness. This opened an honest discussion about loneliness in the Air Force and how she could best support the airmen.

- Joseph Campbell says, "The cave you fear to enter holds the treasure you seek." To get to your treasure (e.g. become a courageous leader, feeling connected, work toward exciting goals), you must *confront the fears* that stand in your way (e.g. fears of making bad decisions, being alone, or getting stuck).

KEY QUOTES

"Daring leadership is ultimately about serving other people, not ourselves. That's why we choose courage."

"The cave you fear to enter holds the treasure you seek."
—Joseph Campbell

One of the hardest things for leaders is to deal with difficult conversations (e.g. giving and receiving feedback, addressing bad behaviors or poor performance) which stir up fear, uncertainty and vulnerability.

- *It's kind to be clear and unkind to be unclear*. When you avoid difficult conversations or tell people half-truths, you're actually doing them a disservice. It's also unfair for you to hold someone accountable if you didn't set clear expectations in the first place.

- Your team members may also find it hard to bring up issues or to articulate their feelings and concerns. If you find yourself dealing with the same problematic behaviors repeatedly, it's a sign that you must dig deeper to *uncover the underlying issues*. Be patient—it may take multiple attempts before people are ready to share/talk.

Here are several tools you can use to have an open conversation and rumble with vulnerability:

- Build a *safe container* to hold your conversations. Ask your team members: "What do you need to show up and do the work?", "What will get in the way of you showing up and doing the work?" and "What does support from me/us look like?"

- Use *permission slips* to explicitly give yourself permission to feel or do something difficult (e.g. to give/receive clear feedback, stay open-minded, or ask for help). You can also apply this as a team, e.g. at the start of a meeting, go round the room and have everyone share their permission slips.

- Resist the instinct to defend your views. *Be curious* about where the other person is coming from:

  (i) Ask for clarification/elaboration with phrases like "Say more" or "Tell me more."

  (ii) Make sure you actually listen. Stop talking and don't interrupt, even during pauses in the conversation.

- Allow people to express and own their feelings, but *set clear boundaries* if their behaviors are unacceptable. For example, "I know this is a difficult conversation and we're

KEY QUOTES

"Clear is kind. Unclear is unkind."

"Leaders must either invest a reasonable amount of time attending to fears and feelings, or squander an unreasonable amount of time trying to manage ineffective and unproductive behavior."

both tired. It's ok to be angry, but it's not ok to shout and throw things."

- Call for a *time-out* if the rumble becomes unproductive, or if you need the time/space to think things through. For example, you can say, "I need some time to think about what I've heard. Can we take a lunch break and circle back in 2 hours?"

- Have the courage to *share your thoughts/feelings*. For example, Colonel Halfhill admitted that she was heart-broken to realize so many airmen were feeling lonely, and she was afraid because she didn't really know what to do. This made it easier for the airmen to open up and find solutions as a team.

Shifting from Armored Leadership to Brave Leadership

Often, leaders try to keep emotions away from the workplace, thinking that it'll make them more efficient. In reality, the opposite is true—when you lock away your heart/feelings, you also lock away the gifts of empathy and emotional literacy. This leads to disconnectedness from yourself and others, to reduce curiosity, engagement, courage and performance.

- *Wholeheartedness* is about knowing that you're whole and worthy of love/belonging despite your imperfections. Instead of trying to hide your feelings to protect yourself, wholeheartedness is about *integrating* your thoughts, feelings and actions. It's about embracing *all* aspects of yourself—both the good and the bad—that jointly make you who you are.

Specifically, Brown's research uncovered 16 types of armor that people wear at the workplace to protect themselves from the fear of failure, being judged, misunderstood or shamed.

- Learn to remove your armor and *move from armored leadership to daring leadership*:

KEY QUOTES

"The problem is that when we imprison the heart, we kill courage."

From Armored Leadership...	...to Daring Leadership
Perfectionism: Focus on appearing perfect to avoid shame, blame, or judgment.	Focus on **how to improve** (with empathy, compassion and healthy struggles).
Foreboding joy: Avoid celebrating or rejoicing to avoid disappointed.	**Practice gratitude** and celebrate milestones and victories.
Numbing: Bury yourself in activities to drown out negative feelings (but end up numbing the positive emotions too).	Confront the underlying feelings. Find ways to **gain real comfort** and renew your spirits.
Winner-vs-Loser mentality: Adopt a binary view and avoid vulnerability.	**Embrace/integrate paradoxes** (e.g. fierce *and* kind, scared *and* brave).
Pretend to be a **know-it-all** or insist on being right.	Focus on **getting things right** instead of being right.
Hide behind **cynicism/sarcasm**.	**Say what you mean**. Clearly express the goal, how to get there, and your belief in others.
Use **criticism** to deflect attention, avoid change or responsibility.	Focus on **(and reward) contribution**, not criticisms.
Exploit power over others for self-interests.	Use power to **effect change** for a wider purpose.
Hustling blindly (jump from 1 area to another or blow your own trumpet) to prove your worth.	Rumble with people: help them to leverage their unique strengths/ contributions and **collaborate**.
Lead with **compliance and control**: micro-manage and create the self-fulfilling prophecy that people can't succeed without tight supervision.	Explain the reason behind strategies, priorities and tasks. Use **TASC**: clarify who owns the Task, give Authority with accountability, give people the time, resources and clarity to Succeed, and have a Checklist of what "done" looks like.
Peg self-worth to productivity: Use work hours to measure value.	Recognize the value of **play, rest and recovery** for creativity and social-emotional skills.
Tolerate a **"fitting-in" culture** where people must suppress their true selves to be accepted.	Build **inclusive cultures** that tap on diverse views/strengths and foster authenticity.
Play up uncertainty and fear to gain control/power	Create a **safe space** for people to rumble, validate facts and manage uncertainties
Focus on **personal credit** and accolades at the expense of the team.	Focus on **helping others** to develop, shine and be rewarded.
Zigzagging: Waste time and energy by avoiding fear/conflict/discomfort.	**Address your own fears/pain**, blind spots and unproductive behaviors, and help others to do the same.
Lead from hurt: Take out fears and frustrations on others.	**Confront your vulnerability**, talk straight and take concrete action.

- Of the defensive behaviors above, the first 3—*perfectionism, foreboding joy, and numbing*—are the most common.

KEY QUOTES

"The people who count are the people who are putting themselves out there and making contributions, cheap seats be damned."

"Once everyone understands their value, we stop hustling for worthiness and lean into our gifts."

"The opposite of play is not work—the opposite of play is depression."
—Stuart Brown

"True belonging doesn't require you to change who you are; it requires you to be who you are."

"It's time to lift up our teams and help them shine."

"Daring leadership is leading from heart, not hurt."

(i) *Perfectionism* is the desire to appear perfect to protect yourself from the feelings of shame, blame, or judgment. It's not about excellence because you're focused on others' opinion instead of your own improvement. In the quest for perfection, you avoid risks and mistakes to block learning and innovation. Since perfection doesn't exist, you're basically setting yourself up for failure, which further reinforces your sense of inadequacy to form a vicious cycle.

→ Brave leaders counter this by encouraging empathy, compassion and healthy struggles. They focus on ways to improve instead of what others think of them.

(ii) *Foreboding joy*: When something joyful happens, we dare not celebrate or rejoice because we think it's too good to be true and we're afraid to get hurt/ disappointed.

→ Brave leaders celebrate milestones and victories. They practice gratitude, e.g. keep a gratitude journal, or start/end each meeting with team members sharing what they're grateful for.

(iii) *Numbing*: We tend to numb negative feelings by burying ourselves in certain activities (e.g. eating, drinking, working, shopping). Unfortunately, when you numb your negative emotions (e.g. anxiety and resentment), you'll also numb your positive emotions (e.g. joy and love).

→ Brave leaders (i) watch out for numbing behaviors, (ii) honestly confront the reasons for the underlying feelings, and (iii) find ways to gain true comfort and renew their spirits (instead of numbing themselves).

Shame and Empathy

Shame is the feeling that we're not "good enough". It's the sense that we're flawed and unworthy of love, belonging, and connection. It can surface any time, e.g. when you're caught lying or when someone calls you a loser.

- There are *3 truths* about shame. Shame is *universal*, i.e. everyone experiences it. We're all *uncomfortable* to talk

KEY QUOTES

"Perfectionism is not a way to avoid shame. Perfectionism is a function of shame."

"We cannot selectively numb emotion. If we numb the dark, we numb the light."

"Shame is universal and one of the most primitive human emotions that we experience."

about it. Yet, the more we *avoid* it, the more power it has over us.

- Shame is often confused with *guilt, embarrassment and humiliation*.

  (i) You feel *guilty* when you do something bad, whereas you feel shame when you think you're a bad person. Guilt can motivate change, while shame can be debilitating.

  (ii) You feel *humiliated* when you don't believe you deserve a bad outcome, whereas shame fills you with self-reproach.

  (iii) *Embarrassment* is more fleeting. We know that others have had similar experiences, and it doesn't define who we are.

- At the *workplace*, shame manifests in the form of perfectionism, gossip, back-stabbing, comparison, favoritism, discrimination, blame, bullying, etc. When these are used as management tools, or when bad deeds are explicitly covered up, it's a sign that shame has become pervasive in a culture.

Empathy is the opposite of shame. It's also the best antidote to shame.

- Empathy is *not* about offering sympathy, advice or trying to fix things. It's about connecting with someone's feelings, and letting them know that we're with them in their pain. Even if you haven't experienced something, you can still empathize with the *underlying emotions* behind the experience.

- You can *express empathy* with phrases like, "Me too", "I understand how you feel", or "Oh man, I feel you." It takes courage to be with someone in their darkness so they don't feel alone. However, it's important to maintain boundaries, i.e. don't take on their struggles or emotions until you get stuck with them.

- Empathy involves *5 skills*:

  (i) Skill #1: *Taking their perspective*. We can never truly see things through someone's eyes since we all have

KEY QUOTES

"The discomfort of cognitive dissonance is what drives meaningful change. Shame, however, corrodes the very part of us that believes we can change and do better."

"Empathy is not connecting to an experience, it's connecting to the emotions that underpin an experience."

"Empathy isn't about fixing, it's the brave choice to be with someone in their darkness."

"Perspective taking requires becoming the learner, not the knower."

different backgrounds and life experiences. However, we can seek to understand them as far as possible, and respect that their perspectives are true even if they differ from ours.

(ii) Skill #2: *Don't judge*. We tend to be the most judgmental in areas where we are the most vulnerable to shame.

(iii) Skills #3 and #4: *Understanding their feelings and articulating that you understand*. However, you can't empathize with others' feelings if you can't even recognize your own. You first need the emotional literacy to process and talk about your own feelings.

(iv) Skill #5: *Be mindful* to relate to those emotions without suppressing or exaggerating them.

- Beware of *6 barriers that block empathy*:

(i) Expressing sympathy, i.e. feeling bad *for* them ("Oh, you poor thing"), instead of feeling bad *with* them ("I feel your pain. I'm with you.")

(ii) Negative reaction, e.g. "Gosh, I'd just die if I were you."

(iii) Expressing disappointment, e.g. "I can't believe you'd make such a mistake."

(iv) Judging or blaming, e.g. "How could you let that happen?" or "It's all his fault. We should make him pay!"

(v) Glossing over it, e.g. "Don't worry, I'm sure it's nothing."

(vi) One-up comparison, e.g. "If you think that's bad, wait till you hear what I went through."

- One of the biggest barriers to empathy is the lack of *self-compassion*. Resist the urge to punish or shame yourself when you stumble. Treat yourself like how you'd treat someone you love.

Build shame resilience by shifting from shame to empathy. This means responding to shame with authenticity and clear values, so you emerge with even more courage, compassion, and connection.

KEY QUOTES

"It's almost impossible to process emotion when we can't identify, name, and talk about our experiences."

"Empathy is feeling with people. Sympathy is feeling for them."

"Empathy is infinite and renewable. The more you give, the more we all have."

- *Understand and recognize shame and its triggers*. That way, you're less likely to default to shame shields like (i) moving away (withdrawals, silence), (ii) moving toward (trying to please/appease others) or (iii) moving against (being aggressive, fighting shame with shame).

- *Be aware*. When we feel shame, we zoom in on our flaws and bad feelings as if there's something uniquely wrong with us. Learn to zoom out and see the fuller picture, including how our feelings are exaggerated by social influences and expectations.

- *Reach out*. Connect with others so you're reminded that shame is universal and you're not alone.

- *Speak shame*. Once you find the courage to talk about shame, it loses its power over you.

Curiosity and Grounded Confidence

Rumbling with vulnerability isn't easy. You will inevitably stumble, fail, and must constantly adjust your approach as you unlearn and relearn. However, if you stay curious and keep practicing, you'll gradually build grounded confidence to (i) uphold your values, and (ii) respond with self-awareness instead lashing out defensively.

Grounded Confidence = Rumble Skills + Curiosity + Practice

- We don't know what we don't know. To get curious about something, you must first have *some* awareness of it. Here are some useful *rumble-starters* to practice curiosity:

  (i) Tell me more.

  (ii) The story I'm making up is...

  (iii) I'm curious about...

  (iv) I'm wondering...

  (v) Help me understand...

KEY QUOTES

"Shame resilience is about moving from shame to empathy—the real antidote to shame."

"Find the courage to share our experiences and the compassion to hear others tell their stories, we force shame out of hiding and end the silence."

"We can't be curious about something we are unaware of or know nothing about."

Skill #2: Living into your Values

Often, our values drive us to do what's courageous or uncomfortable, and to pursue our beliefs even when we're surrounded by critics and cynics. "Living into your values" means to practice what you preach, i.e. to do what you believe to be the most important. This in turn requires that you (i) get clear about your values and (ii) think and act in alignment with those beliefs.

- *Name your values*. All of us have a set of core values that define who we are. These values apply in *all* aspects of our work and personal lives. Download the list of values from the Dare to Lead website, and choose just 1-2 values that are the most crucial to you. These values should meet 3 criteria: They (i) define you, (ii) reflect who you are at your best, and (iii) can guide you in hard decisions.

- *Define key supporting behaviors* for each core value. Consider: (i) 3 behaviors that support each value, (ii) 3 behaviors (which you're tempted to do) that contradict the value, and (iii) an example of a time when you were fully living into the value.

- When you're surrounded by shame, scarcity, and criticism, focus 2 things: *empathy and self-compassion*.

  (i) Empathy: Think of 1-2 people who know and support your values, and what support from them looks like.

  (ii) Self-compassion: Support yourself the way you would someone you love.

Likewise, you can "operationalize" values in organizations by identifying the observable and learnable behaviors that'd allow team members to live into their shared values.

It's especially hard to stick to our values when we're giving and receiving feedback.

- As a rule of thumb, you're ready to *give feedback* if you can:

KEY QUOTES

"Daring leaders who live into their values are never silent about hard things."

"If we can't cheer ourselves on, we shouldn't expect others to do it. If we don't make our values priorities, we can't ask others to do it for us."

"We don't fully see people until we know their values."

(i) Sit next to the other person (not across from them) and put the problem in front of you (not between you).

(ii) Ask questions, listen, and accept you don't know everything.

(iii) Thank them for their effort and recognize their strength (not just criticize or pick at their mistakes).

(iv) Acknowledge your own role in the problem, and hold them accountable without shaming or blaming.

(v) Discuss how the challenges can bring growth/ opportunity.

(vi) Model the openness and vulnerability that you expect from the other person.

- When you're *receiving feedback*, remind yourself to listen, stay open-minded, and act in accordance to your values. For example, you can use self-talk like: "I'm brave enough to listen", or "This is part of the path to mastery."

KEY QUOTES

"The ultimate goal in receiving feedback is a skillful blend of listening, integrating feedback, and reflecting it back with accountability."

Skill #3: Braving Trust

Trust is vital for meaningful relationships and team cohesion. Yet, it's hard to talk about trust—we end up zig-zagging around it or talking in vague terms that lead nowhere. To rumble about trust, you need to get specific. Use the BRAVING Inventory to break it down into 7 specific behaviors that can be explicitly addressed.

- *Boundaries*: Respect others' boundaries. Be willing to ask what's ok or not ok, and to say "no".
- *Reliability*: Do what you say you'll do—know your limitations, manage your priorities and deliver on your promises.
- *Accountability*: Own your mistakes, apologize, and make amends.
- *Vault*: Don't share things that aren't yours to share, e.g. confidential or sensitive information about others.

"Integrity is choosing courage over comfort."

- *Integrity*: Choose what's right, courageous and aligned with your values, not what's easy, fast or comfortable.

- *Nonjudgment*: Talk openly and honestly without judgment.

- *Generosity*: Give others the benefit of the doubt. Interpret their intentions, words and actions as generously as possible.

How to use the BRAVING Inventory:

- *Build/operationalize trust in teams*: Get your team members to individually list down 1-2 observable behaviors for each of the 7 elements. Then, discuss the behaviors that you'll commit to and hold one another accountable for. Remember: trust is built over many small moments, and the goal of this exercise is to help you to identify *how* to build trust as a team.

- *Develop self-trust*: Before you can trust others, you must first learn to trust yourself. Recall a past setback or disappointment and use the inventory to consider your response for each element, e.g. did you set/convey boundaries clearly and keep your promises? Give yourself a pat on the back for each trustworthy behavior, and improve where you fell short.

Skill #4: Learning to Rise

When you learn to sky-dive, the first thing you learn is how to survive a hard landing. Likewise, before you sky-dive into vulnerability, equip yourself with the skills and systems to bounce back from failures.

The Reckoning: Learn to recognize when you're emotionally hooked by something, and get curious about what's going on.

- Recognize the *symptoms* that you're "hooked", e.g. when you replay a conversation repeatedly in your head, feel intense physical/emotional sensations like knots in your stomach, anxiety, confusion, fear or pain.

- Calm down and *get curious* about what's truly happening:

KEY QUOTES

"The intention behind the BRAVING Inventory is a tool for creating the time, space, and intention to talk about trust in a way that's productive and actionable."

"We can never overestimate the relationship between self-trust and trusting others."

"We can't expect people to be brave and risk failure if they're not prepped for hard landings."

"The Learning to Rise process is about getting up from our falls, overcoming our mistakes, and facing hurt in a way that brings more wisdom and wholeheartedness into our lives."

(i) Slow down. Breathe deeply, counting to 4 for each inhale/ exhale.

(ii) Ask yourself if you have enough information to freak out, and if freaking out will help you in any way. Use phrases like: "The story I'm telling myself is…", "I make up that…."

(iii) Give yourself a permission slip to feel. Don't default to defensive behaviors, e.g. lashing out at others, suppressing or stockpiling the hurt.

The Rumble. In the absence of data, we tend to make up stories. Our "shitty first draft" (SFD) is typically full of imaginary fears.

- *Take control of your SFD*. Write down your response, including your emotions, bodily reactions, thoughts, beliefs, and actions.

- *Do a reality check*. Consider:

  (i) What you must learn about the *situation*, including the facts you have/lack and the assumptions you're making;

  (ii) What you must learn about the other *people* involved; and

  (iii) What you must learn about *yourself*, including the role you played and the underlying reasons for your response.

- When you see the *gap* between your stories and facts, you can start to take control of your stories instead of allowing them to control you.

- To rumble as a *team*, first get everyone to write down their thoughts and feelings to make the SFDs explicit. Then, define what you need to rumble about, the additional data needed, and the key lessons you've learned.

The Revolution. Ultimately, the only success that matters is what brings meaning and joy to *you*. Brown urges each of us to answer the call to courage, and support others to do the same. As the collective courage in an organization increases, so will its chances for success.

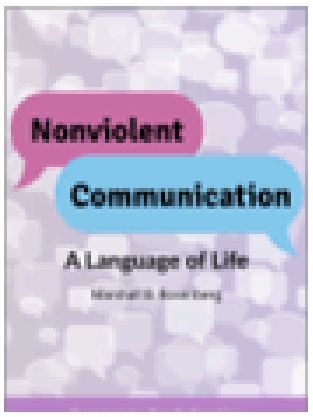
KEY QUOTES

"If the reckoning is how we walk into a tough story, the rumble is where we go to the mat with it and own it."

"Writing slows the winds and calms the seas."

"Own the story and you get to write the ending. Deny the story and it owns you."

"Make your joy and meaning list and make sure that you use it as you define success for yourself."



NONVIOLENT COMMUNICATION

A Language of Life

Marshall B. Rosenberg

The Big "So What"

This book is a detailed guide for Nonviolent Communication (NVC)—an empathic way of thinking and communicating that leads to connection, mutual understanding, and solutions that can fully satisfy *all* parties' needs. This approach can be applied to all types of situations, from intimate relationships to organizational and diplomatic relations.

Introduction: What is Nonviolent Communication?

Nonviolent Communication (NVC) was developed by psychologist Marshall Rosenberg. It trains us to carefully observe and identify the behaviors/conditions that affect us, express ourselves effectively, and listen deeply to foster respect and understanding.

- NVC is *both a process and a mindset*. It's a way to see other people in a compassionate way even under trying circumstances, to listen and speak from the heart, and connect deeply with ourselves and with one another.

- It is not meant to be applied rigidly like a fixed formula, but to be *adapted flexibly* to suit different types of situations, relationships, and conflicts. This book captures the concepts, principles and approaches for NVC.

Communicating with Compassion

When we interact with others, we may unknowingly read into their messages, defend ourselves, or attack what they say. We think we've expressed ourselves clearly, when we may not

KEY QUOTES

"NVC helps us connect with each other and ourselves in a way that allows our natural compassion to flourish."

"The essence of NVC is in our consciousness...not in the actual words that are exchanged."

"NVC is not a set formula, but something that adapts to various situations as well as personal and cultural styles."

"Life-alienating communication...traps us in a world of ideas about rightness and wrongness—a world of judgments."

even know what we truly want or need. Rosenberg identifies several types of communication that alienate people and block compassion:

- When others don't act in alignment with our values, we make *moralistic judgments* that imply they are bad or wrong. We use labels like "lazy," "selfish," or "racist," to judge or classify people, blocking empathy and understanding.

- We *make comparisons* between people to create feelings of superiority or inferiority. These hinder empathy or appreciation for others' unique traits and circumstances.

- We *deny personal responsibility* and blame our thoughts, feelings, or actions on other people, external circumstances, social norms, rules or policies. We say things like "I have to..." "They made me..." or "The boss said so..."

- We *express our desires as demands*, making explicit/implicit threats to punish others if they don't do what we want. We seek to change other people, and push them to do what we want (regardless of what they want). When they don't act the way we expect or approve of, we believe that they deserve to be punished. In turn, others feel resentful or resistant for being coerced.

By contrast, NVC uses 4 key components to communicate clearly and empathically, without blame or criticism:

- *Observations*: Observe the concrete actions that affect us.

- *Feelings*: Identify and express how we feel in relation to those observations.

- *Needs*: Identify the needs, wants, and values that create those feelings.

- *Requests*: Make specific requests that fulfill our needs and enrich our lives.

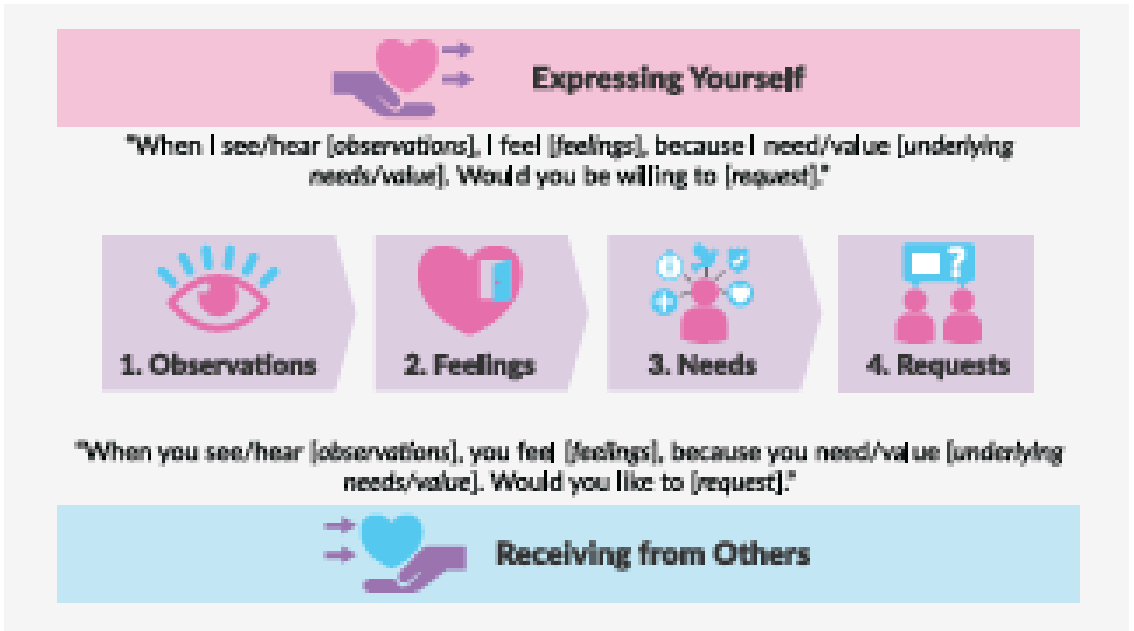
For example, instead of making sarcastic remarks or demanding that your partner puts away his phone during dinner, you might say: "When I notice that you are on your phone during dinner time (*observation*), I feel neglected (*feeling*) because I need connection and presence during our shared moments (*need*). Would you be willing to put your phone away when we eat (*request*)?"

KEY QUOTES

"We all pay dearly when people respond to our values and needs not out of a desire to give from the heart, but out of fear, guilt, or shame."

In the next sections, we'll elaborate on how to use the 4 components in 2 parts to:

- *Honestly express* our needs and feelings; and
- *Empathically receive* others' needs and feelings.



Expressing Yourself Honestly

Use the 4 components of NVC to (i) *observe* a situation, (ii) articulate how you *feel*, (iii) express what you *need*, and (iv) make a specific *request*.

1. Observe Without Evaluation

Separate observations from evaluations. Describe only what you can see or hear, i.e. things that can be captured in a video. Exclude your interpretations, analyses, or judgments.

- When we *mix up observations and evaluations*, it sounds like a criticism to the receiving party, which leads to resistance. You can still have your own opinions or evaluations. However, make a conscious effort to separate your opinions from your observations. For example:

Language	Observation mixed with evaluation	Observation separated from evaluation
Use "to be" verbs instead of specifying your perspectives.	You are selfish.	When I see you take the last slice of pizza without asking if anyone else wants it, I think you're being selfish.

KEY QUOTES

"When we combine observation with evaluation, people are apt to hear criticism."

Language	Observation mixed with evaluation	Observation separated from evaluation
Use verbs with built-in judgments	Sarah gossips.	I heard Sarah sharing personal info about other colleagues 3x today.
Stating someone's thoughts, feelings, or intentions as fact.	He doesn't care about this project.	He hasn't participated in our last 3 project meetings, which gives me the impression that he may not care about this project.
Assume your prediction is a certainty.	If you keep staying up late, you will fail your exams.	If you keep staying up late, I worry that you may struggle in your exams.
Being vague about who/what you're referring to.	Teenagers are such reckless drivers.	My teenage nephew received 3 speeding tickets this month.
Describe an ability as if it's a fact.	Clara is a lousy writer.	Clara failed her last 3 writing assignments.
Use adjectives or adverbs rather than specify your opinion.	This soup is terrible.	The taste of this soup isn't appealing to me.
Being vague about frequency.	You seldom listen.	In our last 5 discussions, you changed the subject or used your phone while I was still speaking.
Generalizing or exaggerating	He's always late.	For our last 4 meetings, he arrived 15min after the agreed time.

KEY QUOTES

"For most of us, it is difficult to make observations, especially of people and their behavior, that are free of judgment, criticism, or other forms of analysis."

2. Identify and Express How You Feel

This is about identifying and expressing how you feel due to the observations. However, most of us are so used to suppressing or ignoring our feelings that we find it hard to express them.

- We confuse our feelings with our *thoughts or opinions*. These can usually be identified when the words "I feel..." are followed by the words "that," "like," "as if," or a name, noun, or pronoun (e.g. "I," "you," or "they"). For example:

Expressing Non-Feelings	Expressing Feelings
"I feel like I'm talking to a wall."	"I feel *uncertain* when you don't respond to what I say."
"I feel Tim is being unfair."	"I feel *upset* when I perceive Tim to allocate tasks unequally between team members."
"I feel this is pointless."	"I feel *frustrated* because I need to see some progress in our discussion."

- We also confuse our feelings with *our sense of identity*, and our interpretation of *how others see/treat us*. For example:

"Our repertoire of words for calling people names is often larger than our vocabulary of words to clearly describe our emotional states."

"Distinguish between what we feel and what we think we are."

- *Interpersonal connection*: Love, trust, and acceptance.
- *Spiritual well-being*: Experiencing beauty, harmony, peace, and inspiration.
- *Physical well-being*: Meeting basic needs like food, shelter, or rest.
- *Play*: Enjoying fun and laughter.

Take emotional responsibility. According to Rosenberg, your feelings come from your own needs, expectations, and perceptions. Others' words and actions might trigger feelings in you, but they cannot *cause* those feelings.

- *Your create your own feelings*. Imagine you're stuck in traffic and someone cuts into your lane.

  (i) If you're late for an appointment, you might get angry and start shouting "What an idiot! Do you think you're the only one in a rush?"

  (ii) If you're ahead of schedule, you might be happy for the slow commute to enjoy your audiobook.

- *You can choose your responses*. Imagine your partner says, "You didn't take out the thrash again!" You can respond in 4 ways.

  (i) *Blame yourself*: "I'm so forgetful. I can't get anything right."

  (ii) *Blame others*: "Well, I forgot because you didn't remind me!"

  (iii) *Perceive your own feelings and needs* without blame: "I see that I forgot the trash again. I feel frustrated because I need to remember my tasks better. Could we brainstorm ways to help me remember this task in the future?"

  (iv) *Perceive others' feelings and needs*, even if they're not explicitly expressed: "It sounds like you're feeling frustrated because you need more help with the household chores. Is that right?

The first 2 responses block compassion to create shame, guilt, resentment, or defensiveness. The last 2 responses connect feelings to needs, making it easier to respond compassionately.

KEY QUOTES

"What others say and do may be the stimulus, but never the cause, of our feelings."

"People are disturbed not by things, but by the view they take of them."
—Epictetus

"Our feelings result from how we choose to receive what others say and do, as well as from our particular needs and expectations in that moment."

Take emotional responsibility by connecting feelings to needs.

- *Do not* use speech patterns that deny or mask emotional accountability. These include:

  (i) Using *impersonal pronouns* like "it" or "that", e.g. "It's really infuriating" or "That really bugs me."

  (ii) Attributing your feelings to *someone's actions*, e.g. "I feel hurt because you broke your promise" or "You make me feel..."

- *Do* use the words "I feel...because I..." For example, "I feel hurt that you broke your promise because I value reliability and trust."

You're likely to move through 3 stages as you develop emotional responsibility:

- "*Emotional slavery*": Initially, you take too much responsibility for others' feelings. To keep everyone happy, you suppress your own needs, only to feel tired and resentful.

- As you realize that you're not responsible for others' feelings, you might swing to the other extreme—to assert your own needs aggressively and ignore others' needs with comments like "That's not my problem" or "I'm not your servant." Rosenberg calls this the "*obnoxious stage*."

- You achieve "*emotional liberation*" when you balance between emotional responsibility and empathy. You own and communicate your feelings and needs, while concurrently empathizing with others' feelings and needs. You might say something like: "I understand that you need my help, and I'd love to be there for you. I'm just feeling overwhelmed with my workload right now. Can we find another way or time to address your needs?"

4. Make Requests to Meet Your Needs

After expressing your observations, feelings and needs, you can now convey clear, specific requests that would satisfy your needs and enrich your life.

KEY QUOTES

"It can be difficult to make clear requests. But think how hard it will be for others to respond to our request if we're not even clear what it is!"

- Use *positive language* to ask for what you want, rather than what you don't want. Make sure your request is specific, achievable, and can satisfy the needs you identified. Use the phrase "Would you be willing to...?"

- You need *all 4 components* for NVC to work. If you express your feelings without an actionable request, the other person won't know what you want from them. If you make a request without expressing your feelings, it could come across like a demand.

- Even if you articulate your request clearly, the other person may not hear the intended message. To verify that the message has been *accurately heard and understood*, ask the listener to paraphrase or reflect back what you said.

  (i) Express appreciation if they try to reflect back your request.

  (ii) Empathize with them even if they refuse.

- After sharing your feelings/needs vulnerably, you will probably want to know how the other person thinks and feels. Be as specific as possible when *requesting for feedback*:

  (i) To ask for *specific feelings*, ask "Could you tell me how you're feeling about...?" rather than "How are you feeling?"

  (ii) To ask for *specific thoughts*, ask something like, "Do you think the proposed changes to the project will be successful? If not, what must we change to improve its chances of success?" rather than "What do you think?"

Remember: you are making a **request, not a demand**. The other person has the right to say "no." Don't try to force or manipulate others into submitting, as it'll only bring resentment and frustration.

- The *difference between a demand and a request* is what happens if the receiving party declines:

  (i) It's a demand if the requester starts to judge, criticize, or see it as a form of a rejection.

  (ii) It's a genuine request if the requester shows empathy for the other person's needs and decisions.

KEY QUOTES

"How do we express our requests so that others are more willing to respond compassionately to our needs?"

"We talk to others or at them without knowing how to engage in a dialogue with them."

- *Treat "no" as a chance to open up a dialogue* and uncover the unmet needs that are stopping the other party from saying "yes."

When you request for a group meeting, let people know when your needs are met. This allows everyone to move on instead of prolonging the discussions unnecessarily.

Receiving Empathically

This is about listening actively to the other person's observations, feelings, needs, and requests, without hearing blame or criticism.

How to Receive Empathically

To practice empathy, you must listen with your entire being, not only with your head. Shed all preconceived notions, and be fully present to what the other person is communicating.

- You can't be fully present if you're *evaluating the problem intellectually in your mind*. This includes: offering advice ("Why don't you..."), offering comfort ("It's not your fault..."), teaching ("You can learn from..."), one-upping ("I went through something worse..."), questioning ("How did that happen?"), or sympathizing ("Poor thing...").

- No matter what they say, focus only on their observations, feelings, needs, and requests. Paraphrase or *reflect back* what you heard, e.g. "Are you feeling overwhelmed because you need help with your workload?" or "Are you feeling anxious because you would like more certainty about our plans?"

  (i) This allows them to confirm or to correct your understanding, and get more deeply in touch with themselves in the process.

  (ii) Use a tone of voice that suggests you're just trying to understand, not stating a conclusion.

- The goal is to *sustain empathy* until you have fully heard the other person's observations, feelings, needs and requests.

KEY QUOTES

"Empathy...calls upon us to empty our mind and listen to others with our whole being."

"Intellectual understanding blocks empathy."

"It is a poignant experience to receive concrete evidence that someone is empathically connected to us."

When the other person feels understood, he/she will probably stop talking, and you can sense a release of tension. You can confirm by asking "Is there more that you wanted to say?"

When you're in pain, it can be hard to empathize with others. You must exercise self-empathy before you can offer empathy to others.

- If you're feeling *defensive or overwhelmed*:

  (i) Breathe, calm down, and ask yourself: "What am I feeling right now? What need of mine is not being met?"

  (ii) Scream nonviolently to convey your emotional state honestly without blame or criticism. For example: "I'm feeling distressed right now and I really need some peace and quiet. Would you be willing to take a break and discuss this later when I'm more centered?"

  (iii) Step away from the situation, take some time to soothe yourself and reflect on our feelings and needs, before returning to the conversation with a clear mind.

Empathy is a powerful tool to create deeper connections, encourage healing, foster understanding, and prevent conflict.

- When we're empathic, we show a genuine interest in others, which encourages them to open up and engage in *deeper conversations*.
- When people feel heard and understood, it *dissolves psychological barriers* (e.g. fear, resentment, or isolation) to start the process of healing.
- Empathy can *defuse potential violence*, since people are less likely to resort to aggressive behavior when they feel heard and understood. When we empathize with others, we also recognize our shared humanity to stop seeing people as monsters.
- Empathy helps us to see others' *refusal* not as a form of rejection, but a sign of unmet needs. For example, your friend doesn't want to meet for drinks because she's exhausted and needs rest, not because she dislikes your company.
- Empathy helps to *breathe life into dull conversations* by injecting curiosity and authenticity into our interactions.

KEY QUOTES

"It is impossible to give something to another if we don't have it ourselves."

"The more we empathize with the other party, the safer we feel."

"Behind intimidating messages are merely people appealing to us to meet their needs."

"All of us want our words to enrich others, not to burden them."

- It helps us to tune into *unspoken feelings and needs*. Try empathic questions like, "You've been quiet. Are you feeling uncomfortable and need more time to process this?"

Nurturing Relationships with Yourself and Others

Practicing Self-Compassion with NVC

NVC isn't just about connecting with others; it's also about connecting with ourselves. It's hard to empathize with others if we're harsh and critical with ourselves. Use NVC to develop self-compassion.

- Once you notice any *self-criticism*, pause to identify the unmet need causing the judgment and regret, so you can find better ways to fulfill that need in the future.

- *Forgive yourself* for the things you now regret. Realize that you were just trying to meet certain needs. Focus on learning and growing from the experience.

Engage only in activities that are aligned with your needs/values, and can enrich your life (as well as those around you).

- *Don't do things out of obligation, guilt, or shame*, since these will only lead to resentment and burnout.

- Stop using the words "I should" and "I have to" to avoid self-blame or a victim-mindset. Take personal responsibility by *reframing your tasks with the words "I choose to."*

  (i) List down all the things you "have to" do. Reframe them with the words: "I choose to.... because I want to..." For example, you can replace "I have to go to work" with "I choose to go to work because I want to support my family and contribute to something I care about."

  (ii) Consciously align your actions with your values, needs and desires. For example, Rosenberg hated writing clinical reports—once he realized that he was doing it purely for financial reasons, he chose to focus on other more fulfilling sources of income.

KEY QUOTES

"When we are internally violent toward ourselves, it is difficult to be genuinely compassionate toward others."

"An otherwise joyful activity performed out of obligation, duty, fear, guilt, or shame will lose its joy and eventually engender resistance."

"We can replace language that implies lack of choice with language that acknowledges choice."

"In connecting moment by moment to our needs, we increase our creative capacity to act in harmony with them."

Expressing Anger and Appreciation

To fully express your anger, you must take responsibility for it. Others' actions may trigger your anger, but they are not the root cause. Your feelings are created by your own needs and perceptions.

- *See anger as a sign to look inward* to address unmet needs:

  (i) Take a moment to breathe deeply.

  (ii) Identify the judgmental thoughts fueling your anger.

  (iii) Pinpoint the unmet needs or values causing the anger.

  (iv) Convey those feelings and needs clearly and directly, without blame or criticism. For instance, instead of yelling "You're always late!", you could say, "I feel upset when you arrive 30 minutes after the agreed time, because I value punctuality."

Compliments can sometimes be used to judge or manipulate others. Show appreciation purely to celebrate, not to influence others or to get something in return.

- *To show appreciation*: Mention the specific action you're thankful for, describe the specific need that was fulfilled by the action, and the positive feeling that arose from satisfying the need. For example: "Jack, when you spent the whole day to help me move my furniture [action], I felt relieved [feeling] because I really needed help to finish the move in time [need]."

- *Receive appreciation with empathy*. Don't act superior nor feign humility.

Conflict Resolution

Traditional mediation vs NVC mediation. Traditional mediation aims to find a compromise between conflicting parties as quickly as possible, whereas NVC aims to build genuine connections and fulfill the needs of *all* parties.

KEY QUOTES

"At the core of all anger is a need that is not being fulfilled...To fully express anger requires full consciousness of our need."

"The cause of anger lies in our thinking—in thoughts of blame and judgment."

"Express appreciation to celebrate, not to manipulate."

"As we let our own light shine, we unconsciously give other people permission to do the same. As we are liberated from our fear, our presence automatically liberates others."

- All human beings share universal needs, such as our need for autonomy, meaning, interpersonal connection, etc. However, we use different strategies to fulfill those needs. For example, we may seek social connection (a need) by meeting up with friends (a strategy). Often, conflicts are caused by *clashes in strategies, not needs*.

- NVC is built on the belief that *all conflicts arise from unmet needs*. Once those needs are understood and respected, you can find strategies that meet everyone's needs quickly.

Rosenberg presents 5 steps for NVC conflict resolution. The first 2 steps are interchangeable—either party can express their needs first.

- *Express your needs* clearly and specifically, focusing on what you want (not what you don't want).

- *Understand their needs*: Listen empathically with your whole being, even if they're being critical or judgmental. Aim to uncover the feelings and needs behind their words.

- *Confirm mutual understanding*, or whether you've understood each other's needs.

- If there's any confusion, *sustain empathy* until both sides are satisfied that their needs have been fully heard and understood.

- Once all needs are clear, *brainstorm strategies* to meet those needs. Present requests using positive action language, and focus on what can be done *now*.

Use NVC to resolve both internal and external conflicts:

- *Free yourself* from old programming and cultural conditioning, e.g. reject notions that it's weak to show sensitivity or vulnerability, or it's selfish to express your needs.

- *Resolve inner conflicts* to prevent depression. Recognize that all needs arise from a desire to enrich your life. Instead of judging certain desires as "bad," explore ways to satisfy *all* your needs.

- When you empathize with others' feelings and needs, it also *reduces external conflict* as you're less likely to judge others negatively and respond aggressively.

KEY QUOTES

"When we hear another person's feelings and needs, we recognize our common humanity."

"To resolve conflicts using NVC, we need to train ourselves to hear people expressing needs regardless of how they do the expressing."

Use of Force

In rare situations where communication is impossible due to imminent danger, protective use of force may be necessary. For example, if a child is about to run into traffic, his parent may pull him back firmly to protect him from potential harm. The key is to protect others, not to punish or blame.

- By contrast, *punitive force* is about using pain or consequences to discipline or control someone. Using the same scenario, the parent might later punish the child (e.g. restrict his playtime) to teach him a lesson. Such methods are counter-productive, since they tend to create resistance and resentment. In fact, punishments and rewards don't bring true behavioral change as they don't address the needs driving the behavior.

- Before applying any force, ask yourself *2 questions*:

  (i) "What do I want this person to do?"

  (ii) "What do I want this person's reasons to be for doing it?"

  The second question will help to weed out ineffective extrinsic motivators.

Conclusion and Other Details to Look out For

NVC helps to cultivate new relationships with yourself and others, to understand and fulfill mutual needs in relationships, and achieve true peace and harmony.

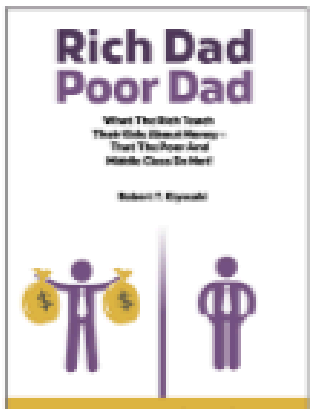
The book is packed with detailed case studies and sample conversations to help readers to understand and apply the NVC principles and components. It also includes a list of universal human needs, a list of words to express feelings specifically, as well as other tips for professional mediator, therapists, and counsellors. For more details and resources, please visit https://www.cnvc.org/.

KEY QUOTES

"We can never make people do anything."

"When we submit to doing something solely for the purpose of avoiding punishment, our attention is distracted from the value of the action itself."

"NVC helps us create a more peaceful state of mind by encouraging us to focus on what we are truly wanting rather than on what is wrong with others or ourselves."



Rich Dad Poor Dad

What The Rich Teach Their Kids About Money
–That The Poor And Middle Class Do Not!

ROBERT T. KIYOSAKI

The Big "So What"

Why do the rich get richer, and the poor get poorer? Why do the educated middle class have a successful career, yet struggle with their financial commitments? In this book, Kiyosaki shares what he learned about wealth from his "rich dad" and "poor dad", the secrets that separate the Rich from the Poor and Middle Class, and how we can apply this to grow our wealth.

Introduction

Money and financial literacy are not taught in schools. Most people learn about money from their parents, and that's partially why the rich get richer and the poor get poorer.

Kiyosaki was fortunate to grow up with 2 fathers – one rich and one poor. By comparing and reflecting upon the different advice given by each dad, Kiyosaki was able to learn from both of them.

- "Poor Dad". His father was a school teacher with good degrees and a Ph.D. Yet, despite earning a good salary, he struggled with debt and finances his whole life.

- "Rich Dad". His best friend Mike's father was a business owner who never finished eighth grade, but eventually became one of the richest men in Hawaii.

At the age of 9, Kiyosaki and Mike asked Rich Dad to teach them how to get rich. Rich Dad began their financial education through real-life lessons, for 30 years until Kiyosaki was 39 years old. In this book, Kiyosaki shares his learning journey and the 6 fundamental lessons that he learned over these 30 years. In this summary, we've condensed the lessons into 3 parts.

KEY QUOTES

"Having two dads offered me the choice of contrasting points of view: one of a rich man and one of a poor man."

"There is a difference between being poor and being broke. Broke is temporary. Poor is eternal."

"Life is the best teacher of all. Most of the time, life does not talk to you. It just sort of pushes you around. Each push is life saying, 'Wake up. There's something I want you to learn.'"

"Proper physical exercise increases your chances for health, and proper mental exercise increases your chances for wealth."

Part 1: Don't work for money.

Work to learn, and make money work for you.

Get out of the Rat Race

Most of us are controlled by our emotions of fear and desire for money:

- Fear: Most people go to work every day to earn money to pay their bills. They fear being fired, not being able to pay their bills, having to start over...

- Desire (or greed): With more money, people buy more and better things, which give them short-term joy, satisfaction and comfort. However, the more they earn and spend, the harder they must work and the more they fear losing their jobs. They are caught in the "rat race", blame their employers for paying them too little, or working them too hard.

The same applies for many "rich people" who may appear wealthy, but are emotionally broke. They amass loads of money to overcome their fear of not having money, only to end up with more fears of losing the money and status that they've earned. Start by recognizing your fears about money, so you can master them.

Make money work for you

Money is an illusion. By applying your brains, you can make money work for you.

Rich Dad began Kiyosaki and Mike's financial education by giving them a taste of "working life". At 9 years old, the boys "worked" for Rich Dad at 10 cents an hour, and were even offered a pay-rise. Their breakthrough came when they stopped looking at their "job" as the main source of income, and sought alternative ways to make money.

The 2 boys opened a comic book library – they collected used comic books, charged 10 cents for neighbourhood kids to read as many comics as they liked in 2 hours, and hired Mike's sister to manage the library. They started to see what it meant to have money work for them: their business generated money even when they weren't physically there.

KEY QUOTES

"The poor and the middle class work for money. The rich have money work for them."

"Fear pushes you out the door, and desire calls to you. That's the trap."

"I want to teach you to master the power of money, instead of being afraid of it."

"Fear keeps (people) in this trap of working, earning money, hoping the fear will go away... Money is running their lives."

"If you don't first handle fear and desire, and you get rich, you'll only be a highly paid slave."

Rich dad believed that the words "I can't afford it" shut down your brain. "How can I afford it?" opens up possibilities, excitement, and dreams."

"A job is really a short-term solution to a long-term problem."

"Most people... think that more money will solve the problem and don't realize that it's their lack of financial education that is the problem."

Work to Learn

In the long run, education is more valuable than money. Hence, Kiyosaki encourages us to work not just for money and security, but to learn. He picked up various skills through a wide range of jobs:

- For years, Kiyosaki worked in different areas of Rich Dad's companies. He also tried working as a bus boy, a construction worker, in reservations, sales and marketing.

- He resigned from a high-paying job with Standard Oil, and joined the Marine Corps to learn international trade and leadership. Recognizing his own fear of door-to-door sales, he joined Xerox Corp to learn to sell, and worked there for 4 years until he overcame the fear and was one of the top salespeople in the company.

- He concurrently started his first business in 1977, which gave him even more motivation to work hard to amass money to invest in real estate.

Focus on learning how to manage cash flows, systems and people, as well as improving your communication, sales and marketing skills, which are foundational to success in any area. If necessary, take a second job that can teach you the necessary skills, or join a network-marketing company to learn sales skills and overcome your fear of failure and rejection.

KEY QUOTES

"To be the master of money, you need to be smarter than it. Then money will do as it is told. It will obey you. Instead of being a slave to it, you will be the master of it. That is financial intelligence."

"Job security meant everything to my educated dad. Learning meant everything to my rich dad."

"In the long run, it's not how much money you make. It's how much you keep, and how many generations keep it."

Part 2: Get financially educated.

Work to learn, and make money work for you.

Growing assets are like planting a tree – you need to tend to it for years, until its roots are deep enough to provide shade and bear fruits for your enjoyment. Unfortunately, many people want to get rich quickly without learning about money. That's like building a skyscraper with little or no foundation, and that's why people lose millions as quickly as they acquire it.

Schools equip us with skills to work for money, but not to harness the power of money. Without financial skills, educated people may have a successful profession and a good salary, but they don't keep the money they've earned, nor make the money work hard for them.

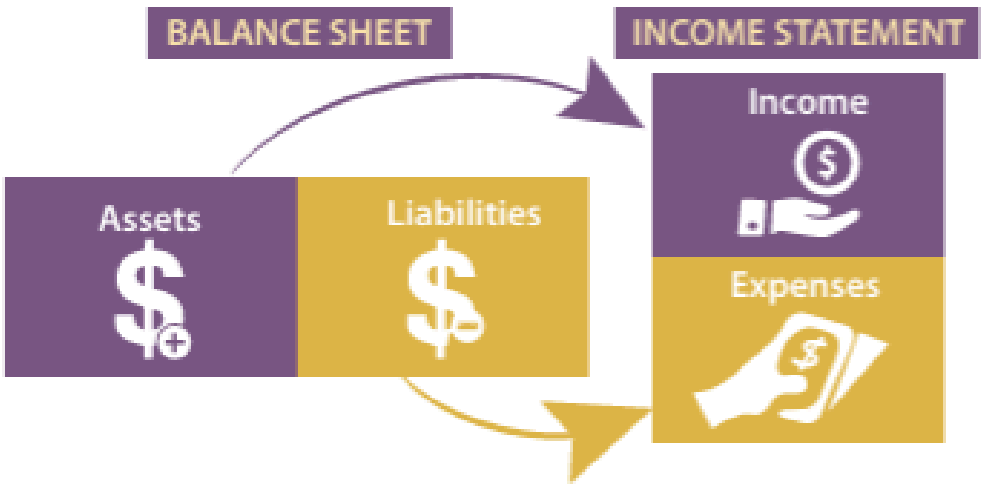
"Money is one form of power. But what is more powerful is financial education. Money comes and goes, but if you have the education about how money works, you gain power over it and can begin building wealth."

"It's called financial aptitude—what you do with the money once you make it, how to keep people from taking it from you, how to keep it longer, and how to make that money work hard for you."

Financial education requires real-life application and is a life-long process.

Buy Assets, not Liabilities

In order to buy assets, you must know the difference between an asset and a liability. Simply put, an asset puts money *in* your pocket, while a liability takes money *out* of your pocket. You also need to look at cash-flow, as they tell a story of how the money flows and how the money is being handled.



Your home is a liability, not an asset

Have you been told that "your home is your biggest investment"? Well, if your house isn't generating income, it's a liability. Moreover:

- If you buy a new house every few years, with a new 30-year loan, you never really own your home;
- Houses don't always appreciate in value. Instead, property taxes may increase, causing extra financial strain;
- The money tied up in the house, the cost of maintaining the house, and the time that you spend working to pay off the mortgage, all represent opportunity costs.

If you wish to buy a bigger house, don't buy it with cash or loans. Buy assets that'll generate the cash flow to pay for the house. That way, you avoid losing time (during which your assets could have grown in value), losing capital (which could have been invested elsewhere), and losing learning opportunities (from other investments you could've made if the money wasn't locked up in the house).

KEY QUOTES

"Rich people acquire assets. The poor and middle class acquire liabilities that they think are assets."

"Your home is an emotional thing and when it comes to money, high emotions tend to lower financial intelligence."

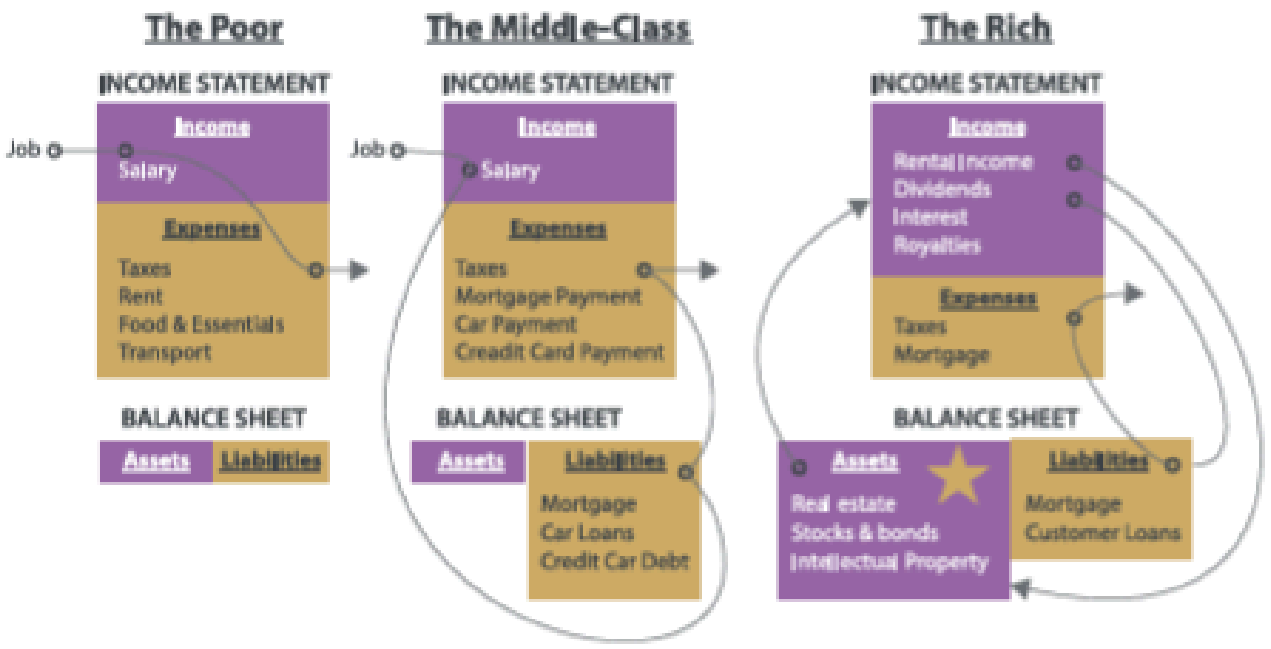
"All too often, a house only serves as a vehicle for incurring a home-equity loan to pay for mounting expenses."

"More money seldom solves someone's money problems. Intelligence solves problems."

Focus on your Asset Column, not Income Statement

- The rich get richer because they buy assets, which generate cash.
- The poor only have expenses; thus they're stuck in a poverty loop.
- The middle class struggle, because they buy liabilities they *think* are assets. They spend their income on "assets" like dream homes, cars, children, which are actually liabilities that generate expenses. They work harder to earn more money, only to pay more taxes as their salary increases.

To get rich, grow your asset column. When it generates more than enough income to cover expenses, you'll grow richer without putting in physical labour. Reinvest the balance into the asset column to form a virtuous cycle, or reward yourself with luxuries using the proceeds.



Work for yourself

Most employees struggle financially because they spend their lives working for everyone except themselves. They spend all their time working for their company, pay taxes to the government, pay interest to the bank (for mortgage, car loans or credit card debts), *then* pay themselves whatever is left.

Instead, mind your own business - keep your daytime job, keep expenses low, reduce liabilities and start building a base of solid assets, such as:

- Businesses that you own but don't require your presence;

KEY QUOTES

"The rich focus on their asset columns, while everyone else focuses on their income statements."

"If you work for money, you give the power to your employer. If money works for you, you keep the power and control it."

"Financial struggle is often directly the result of people working all their lives for someone else."

- Stocks, bonds, income-generating real estate, notes (IOUs), royalties from intellectual property (e.g. music, scripts, patents); and

- Anything else with value, produces income or appreciates, and has a ready market.

Pay yourself first–invest in building your assets *before* paying your bills, and don't ever dip into your savings or investments for your expenses. This may sound extreme, but the pressure from your creditors and unpaid bills could motivate you to seek new opportunities that you'd otherwise overlook.

Focus on Wealth, not Net worth

Net-worth measures your net economic position, i.e. all the assets you own, minus your liabilities. Sadly, your net worth could be a lot less than it appears. This is because:

- Your net worth includes non cash-producing assets and personal effects, like your car and golf clubs, which become less valuable once you use them; and

- When you sell your assets, you are taxed for your gains.

A more meaningful measure is your wealth, i.e. how long you can survive if you stopped working today. The larger your asset column, the more income you generate even if you're not working.

Here are some useful tips to start growing your wealth:

Start a business *only* if you want to. Businesses have a high failure rate: 90% of companies fail in 5 years, and 90% of the survivors fail subsequently. Kiyosaki recommends that you start a business only *if* you really wish to be an entrepreneur. Otherwise, work hard at your job and concurrently build your asset column. After all, every dollar in your asset column is like an employee who works 24x7 for you, for generations.

Buy assets first and buy luxuries last. If you buy luxuries first (e.g. a nice car or a big house on credit), you build liabilities. Treat the luxury items as a reward for growing your assets – buy them only when you've built up enough assets, such that the income from your assets pays for your luxury items.

KEY QUOTES

"Once a dollar goes into your asset column, it becomes your employee. The best thing about money is that it works 24 hours a day and can work for generations."

"Only if you really have the desire to own your own company do I recommend it. Otherwise, keep your day job and mind your own business."

"An important distinction is that rich people buy luxuries last, while the poor and middle class tend to buy luxuries first."

Go for investments that you love and understand. Kiyosaki personally loves real estate and small businesses:

- For real estate, he starts small and keeps trading up for bigger properties, usually holding them for less than 7 years. That way, he delays paying taxes on the gains, while giving time for the property value to rise.

- For small companies, he uses his business acumen to pick the right stocks, and aims to be out of the stock in a year..

Teach your children to differentiate between assets and liabilities before they strike out on their own.

Learn about money

Your Financial IQ is a combination of 4 areas of expertise:

Accounting is the ability to read numbers and understand financial statements, so you can identify the strengths and weaknesses of any business.

Investing involves creative strategies and formulas to "make money with money".

Markets are about supply and demand. Understanding markets involve knowing the economic, technical and emotions-driven aspects of the market, so you can assess if an investment makes sense given prevailing market conditions.

The law. The corporation is a powerful tool to integrate your accounting, investing, and market expertise. It allows you to do a lot of things you can't do as an individual, such as:

Protection from lawsuits. The rich "hide" much of their wealth through vehicles like trusts and corporations. If you sue a rich person, you may find that under the layers of legal protection, he/she controls everything, yet owns nothing.

Tax advantages (i.e. pay expenses before paying taxes). An employees gets taxed first and can only spend what's left; a corporation spends first and gets taxed on what's left.

KEY QUOTES

"True learning takes energy, passion, and a burning desire."

"You want to know a little about a lot" was rich dad's suggestion."

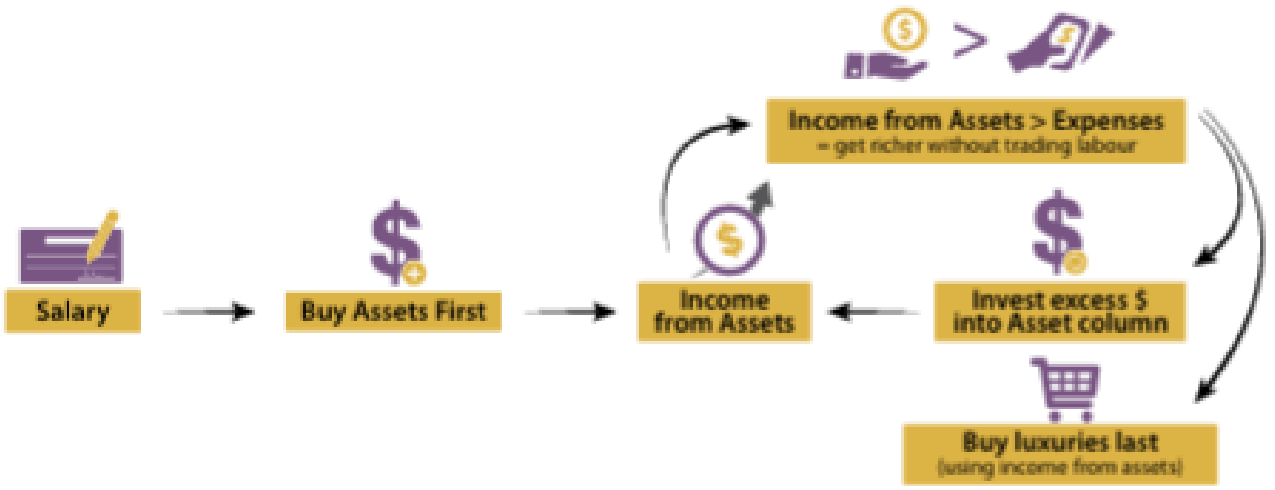
"Investing is not buying. It's more a case of knowing."

"The best investments are usually first sold to sophisticated investors, who then turn around and sell them to the people playing it safe."

With some creativity, you can legally deduct items like vacations, meals, insurance, and club memberships as company expenses.

These 4 technical skills aren't as complex as it may seem, and can be learned.

This diagram summarizes some of the key ideas above:



PART 3: Take charge of your wealth

Don't wait for opportunities. Create them.

The History of Taxes

Most of us love the Robin Hood story of robbing the rich for the poor, and we see taxes as a way to achieve that outcome. The reality is, the rich are not taxed; it's the middle class who pays for the poor. To understand this, you need to understand the history of taxes.

Income taxes originated in England in 1874, and was introduced permanently in the United States in 1913. In both cases, taxes were initially levied only against the rich, but ended up penalizing the poor and middle class. Taxes were accepted by the masses who thought it would only punish the rich. However, as the government grew, it needed more taxes to support its operations. Taxes were levied on the middle class, and it trickled down from there.

In the meantime, during the days of sailing ships, the rich created the corporation to limit their business risks. Sea voyages were financed via a corporation, which in turn hired the crew to sail to the New World to look for treasure. If the entire ship and crew were lost, the rich could limit their losses to the money invested for that specific voyage.

KEY QUOTES

"Education is more valuable than money, in the long run."

"There is gold everywhere. Most people are not trained to see it."

"Often in the real world, it's not the smart who get ahead, but the bold."

"Although (tax) was intended to punish the rich, in reality it wound up punishing the very people who voted for it, the poor and middle class."

"The socialists ultimately penalized themselves due to their lack of financial education... The rich outsmarted the intellectuals solely because they understood the power of money, a subject not taught in schools."

Through the corporation, the rich found a way to get around taxes:

- The income-tax rate of a corporation is less than the individual income-tax rates; and

- Certain expenses could be paid by a corporation with pre-tax dollars, reducing the taxable income for the rich.

The rich can outsmart the tax system because they understand how money works. They invest money, power, and time to hire smart attorneys and accountants, lobby politicians to change laws, and use their brains and resources to change things. The poor and middle class are too busy working and uninformed to find such solutions.

The Rich Invent Money & Create Opportunities

Many people complain they have no opportunities, when they aren't even actively looking, or fail to recognize a rare opportunity staring at them in the face. Others see great opportunities but have no money to leverage them. Financial intelligence is about creating more options for yourself – knowing how to improve your financial position, to make an opportunity work in your favour, or turn a problem into an opportunity.

Kiyosaki shares how he personally created opportunities for himself:

- He made millions using games and simulations to teach financial intelligence, filling an educational gap that schools don't address.

- He invested in undervalued properties and turned them around for a profit. For example, in the depressed market of early 1990s, he found undervalued properties from the bankruptcy attorney's office or the courthouse, and made about $190,000 in property transactions with about 30 hours of work.

Obviously, investments come with risk, and Kiyosaki was able to profit from them after years of practice. However, you can lower your risks with knowledge, wisdom and love of the game.

Start small and scale up. Plant small seeds in the assets column. Some will grow and some won't; From those that grow, you can plant bigger seeds and gradually grow your

KEY QUOTES

"Instead of climbing the corporate ladder, why not own the ladder?"

"My rich dad just played the game smart, and he did it through corporations— the biggest secret of the rich."

"The world is always handing you opportunities of a lifetime, every day of your life, but all too often we fail to see them."

"The more I learn...the more money I make simply because I gain experience and wisdom as the years go on."

"It is not gambling if you know what you're doing. It is gambling if you're just throwing money into a deal and praying."

"Often, the best deals that make the rich even richer are reserved for those who understand the game....The more sophisticated I get, the more opportunities come my way."

asset base. Kiyosaki likens the process to riding a bike. You will inevitably fall and probably hurt yourself in the process. It's important to have fun and not take the small losses too seriously.

Take time to hone your financial intelligence. The more you play the game, the more you understand it, and the easier it is to spot good opportunities or transform a bad deal into a good one. That's why working hard at your job and "playing safe" comes with a huge opportunity cost: the failure to gain financial intelligence.

Retail or Professional Investment. Most investors are retail investors - they buy packaged investments, much like buying a computer from a computer store. Professional investors like Kiyosaki assemble their own opportunities, much like assembling a computer using component parts. This takes much more skill and experience, but the rewards are also much bigger.

Start

Getting Started

Overcoming Obstacles

Besides the lack of financial literacy, there are 5 key obstacles that could hinder your ability to develop abundant asset columns.

Fear. Nobody likes to lose money, yet losses are inevitable in investments. The solution is to:

- Start as early as possible (especially if you are risk-averse); and
- Learn the "Texan attitude": Don't be afraid to win big and lose big; turn your failures into rallying cries for success.

Cynicism. Our doubts can paralyze us. Yet, the most gloomy and volatile times are also the best times to make money. Have the courage to take action in spite of the fearful voice in your head, and to ignore rumours of doom and gloom.

Laziness. "Busy-ness" is often an excuse to avoid dealing with the difficult issues. The best way to overcome laziness is to focus on something you want (e.g. money, success, freedom).

KEY QUOTES

"Great opportunities are not seen with your eyes. They are seen with your mind."

"There is always risk, so learn to manage risk instead of avoiding it."

"(Financial intelligence) is not so much what happens, but how many different financial solutions you can think of to turn a lemon into millions. It is how creative you are in solving financial problems."

"The single most powerful asset we all have is our mind. If it is trained well, it can create enormous wealth."

"The primary difference between a rich person and a poor person is how they manage fear."

"For most people, the reason they don't win financially is because the pain of losing money is far greater than the joy of being rich."

"Life is much like going to the gym. The most painful part is deciding to go. Once you get past that, it's easy."

"Be a little greedy. It's the best cure for laziness."

Bad habits. Break the bad habit of paying yourself last. Allow yourself to be pressurized by your creditors so you'll feel the urgency and motivation to seek out new sources of income.

Arrogance. Don't hide your ignorance behind arrogance. Confront what you don't know, rather than dismiss it as unimportant.

Unleash your Financial Genius

Here are 10 philosophies to help you unleash your financial genius

1. **The power of spirit.** Identify your deepest desires and pains which drive you.

2. **The power of choice.** Shape your life through your daily choices, be it how you think about money, who you learn from or how you spend or invest that next dollar.

3. **The power of association.** The right people and rich friends can give you access to valuable information and opportunities.

4. **The power of learning quickly.** Learn fast and apply what you've learnt.

5. **The power of self-discipline.** Always pay yourself first. Avoid liabilities, and build assets before buying luxuries.

6. **The power of good advice.** Pay your brokers well for useful information and sound education (which are priceless).

7. **The power of getting something for nothing.** Go beyond Return of Investment (ROI); look at what assets you can get for free once you get your money back.

8. **The power of focus.** Focus relentlessly on building your assets column, and only buy luxuries using assets.

9. **The power of myth.** Find your heroes so you can be inspired by them.

10. **The power of giving.** Give generously what you wish to get – be it money, education, love or friendship.

KEY QUOTES

"If you have little money and you want to be rich, you must first be focused, not balanced."

"If I pay myself first, I get financially stronger, mentally and fiscally"

"I've learned that, without a strong reason or purpose, anything in life is hard."

"That is a choice we all make daily: the choice of what we do with our time, our money, and what we put in our heads."

"When it comes to investing, too many people make it sound hard. Instead, find heroes who make it look easy."

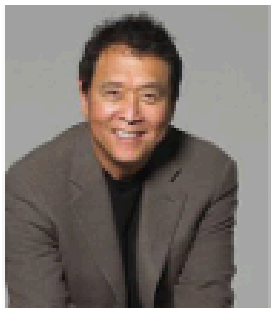
"When it comes to money, love, happiness, sales, and contacts, all one needs to remember is to give first."

Other Useful Details in the Book to Look Out For

Kiyosaki shares many interesting snippets of his learning experience with Rich Dad, as well as his personal stories and experience. He also provides many illustrated examples of cash-flows, balance sheets, and income statements of the rich, poor & middle class, to help us understand core financial concepts. Besides the 10 philosophies to hone your financial genius, he also provides 10 to-do items for you to start applying the tips from the book.

For more details get a copy of the book or check out www.richdadworld.com

About the Author



Robert Toru Kiyosaki (born 1947) is an American businessman, investor, self-help author, educator, motivational speaker, activist, financial commentator, and radio personality. Kiyosaki is the founder of the Rich Dad Company, a private financial education company that provides personal finance and business education to people through books, videos, games, seminars, blogs, coaching, and workshops.

He is also the creator of the Cashflow board and software games to educate adults and children business and financial concepts. Besides "Rich Dad Poor Dad", Kiyosaki also authored more than 26 books, and established several financial literacy programs. In 2005, he was inducted into the Amazon.com Hall of Fame as one of the top 25 bestselling authors.

KEY QUOTES

"Money is only an idea. If you want more money, simply change your thinking. Every self-made person started small with an idea, and then turned it into something big."

"The key to financial freedom and great wealth is a person's ability to convert earned income into passive and/or portfolio income."

"There are powers in this world that are much smarter than we are. You can get there on your own, but it's easier with the help of the powers that be."

THE MILLIONAIRE NEXT DOOR

The Surprising Secrets of America's Wealthy

THOMAS STANLEY AND WILLIAM DANKO

The Big "So What"

Many people dream of becoming millionaires, owning fancy cars, luxurious houses and enjoying a lavish lifestyle. In this book, Stanley and Danko present the surprising findings of how the majority of self-made millionaires truly live and build their wealth. In fact, you may be living next to a millionaire now and not even know it.

The findings are based on 20 years of research, including interviews and surveys of more than 500 millionaires and tens of thousands of high net-worth and/or high-income individuals in America. They explain the difference between income and wealth, how ordinary Americans became millionaires in 1 generation, and how you can apply these insights to accumulate your own wealth.

What does "Wealth" Really Mean?

Defining Wealth

Most people define wealth as having plenty of material possessions. However, a lavish lifestyle is merely a sign of high expenses and not necessarily wealth. The authors identify a "millionaire" as someone who owns significant assets (including cash, investments, appreciable assets), with a net worth of at least US$1 million. At the time of their study, only 3.5% of 100 million households in America fulfill this criteria.

- 80% of America's millionaires are **first-generation rich**, i.e. they accumulated their own wealth (and did not become rich due to a huge inheritance or windfall). This is evidence that wealth can be accumulated within one generation.

- Out of the millionaires surveyed, 95% have a **net worth of $1-10 million**, and this book focuses on this majority.

KEY QUOTES

"We have discovered who the wealthy really are and who they are not. And, most important, we have determined how ordinary people can become wealthy."

"Wealth is what you accumulate, not what you spend."

"(People) think millionaires own expensive clothes, watches, and other status artifacts. We have found this is not the case."

Contrary to popular belief, the process of accumulating wealth is not a flashy, rapid process, but a slow one that takes years. This is the typical profile of a wealthy, financially independent person from the study:

"(He is) a businessman who has lived in the same town for all of his adult life. This person owns a small factory, a chain of stores, or a service company. He has married once and remains married. He lives next door to people with a fraction of his wealth. He is a compulsive saver and investor. And he has made his money on his own."

Net Worth and Wealth Accumulation Behaviours

How much net worth should be expected, given your current age and income? Use this formula to calculate your **expected net worth:**

$$\frac{\text{Your Age} \times \text{Pre-tax Annual Household income*}}{10}$$

*(all sources of income except inheritances)

To know where you stand relative to your peers (given your age and income), look at your actual net worth versus your expected net worth. The authors compare those they call **PAWs (Prodigious Accumulator of Wealth)** and **UAWs (Under Accumulators of Wealth).**

A **PAW** is in the top quartile for wealth accumulation, and has twice the level of net worth expected for his age/ income level.

A **UAW** is in the bottom quartile, and has half the level of net worth expected.

PAWs usually have at least four times the amount of the wealth accumulated by UAWs. For example, if you are 50 years old with a total household income of $90,000, your expected net worth is $450,000 - A PAW in this case may have a net worth of $1 million, while a UAW may have a net worth of only $250,000.

From their research, the authors found that most self-made millionaires are PAWs, and they share 7 common denominators, which are outlined in this summary. Essentially, they live frugally, ensuring that they adhere to a strict household budget and invest prodigiously. They may not earn huge incomes, but they accumulate wealth by living well below their means.

KEY QUOTES

"Self-employment is a major positive correlate of wealth."

"It matters less how much more you make than what you do with what you already have."

Obviously, there are also millionaires who inherited their wealth, and/or earn such a high income that they have a net worth of over $1million after deducting their high expenses. However, they tend to be UAWs, living lavish lifestyles but feeling quietly insecure about sustaining it. Yet, the mass media tends to focus on such sensational, flashy lifestyles, shaping our mistaken perception of "how the wealthy live", and promoting the high-consumption culture that impoverishes many of our younger generation.

7 Denominators of Wealthy People

In essence, it doesn't matter how much you earn; it matters more how much you spend and invest relative to how much you earn. Here are the 7 common denominators of truly wealthy people.

1. Living well below your means

It is a myth that millionaires drive fancy cars, live in huge mansions in ultra-rich neighborhoods and wear designer clothes. Frugality was found to be a crucial foundation of wealth-building.

Most millionaires concurrently play offense when generating income, and defense when spending on consumer goods and services:

- Stanley and Danko were shocked to find that the decamillionaires (people worth at least $10 million) at their focus group interviews actually preferred soft-drinks, beer and club sandwiches to "premium foods" like pates, caviar and vintage wines.

- Most millionaires do not waste time and money buying expensive consumables like suits, shoes, watches, and motor vehicles. For example, half of the millionaires surveyed had never spent more than $235 for a wristwatch or more than $140 for a pair of shoes. They are also 6 times less likely to own a $1,000 suit (compared with corporate middle managers and professionals who earn high-incomes but also have high expenditures).

- They are typically supported by spouses who are often even more frugal than they are.

KEY QUOTES

"All too often young people are indoctrinated with the belief that 'those who have money spend lavishly' and 'if you don't show it, you don't have it'."

"Whatever your income, always live below your means."

"What are three words that profile the affluent? FRUGAL FRUGAL FRUGAL"

"Allocating time and money in the pursuit of looking superior often has a predictable outcome: inferior economic achievement."

"A couple cannot accumulate wealth if one of its members is a hyperconsumer."

Here 4 common practices of wealthy households:

They operate on an annual budget. By creating an artificial environment of economic scarcity, they keep themselves financially disciplined. Millionaires ensure that they pay themselves first, by investing at least 15% of their annual income before paying for other expenses like home, food clothes etc.

They know exactly how much and what the family spends each year. Because millionaires focus on becoming financially independent, they keep track of both their income and expenses. Being self-employed helps, as they can apply business budgeting principles to their own household. In short, a household that earns $600,000 and spends $100,000 is, in the long run, better off than a household that earns $2 million and spends $1.5 million.

They have clearly-defined daily, weekly, monthly, annual and lifetime goals. Hence, they tend to be more focused and goal-oriented.

They spend a lot of time planning for their financial future. Their financial independence did not happen by chance. It's the outcome of careful planning and consistently sacrificing high consumption today for financial independence tomorrow.

In short, most of these self-made millionaires became millionaires by budgeting and controlling their expenses. After becoming wealthy, they maintained their affluence through these sound practices. Similar to how people who are healthy tend to eat well and exercise regularly to maintain fit, wealthy people work hard to maintain their financial health. On the other hand, flashy households with six-figure annual incomes are not wealthy because of their earn-and-consume cycle.

2. Use Time, Energy and Money Efficiently

Time, energy, and money are finite resources, and wealthy people channel these resources efficiently to build wealth. They start earning and investing as early as possible in their adult life.

KEY QUOTES

"Few people can sustain profligate spending habits and simultaneously build wealth."

"Being a well-educated, high income earner does not automatically translate into financial independence. It takes planning and sacrificing."

"Too many high-income/ low-net worth types live from paycheck to paycheck, fearing a sudden downturn in our economy."

"Those who are wealthy work at staying financially fit. But those who are not financially fit do little to change their status."

"Efficiency is one of the most important components of wealth accumulation. Simply: People who become wealthy allocate their time, energy, and money in ways consistent with enhancing their net worth."

The authors found a negative correlation between education and wealth accumulation (for high-income earners with at least $100,000 annual income). Besides the opportunity cost of spending additional time in college, professional school or graduate school, these educated high-income earners are often socialized into a consumption culture and become UAWs.

PAWs generally allocate almost twice the number of hours than UAWs each month toward financial planning (e.g. consulting with investment advisors, accountants etc.). Although UAWs worry about their economic well-being, they do not take the same disciplined actions as the PAWs (e.g. curbing consumption or investing before spending).

How do PAWs plan and manage their finances and wealth?

They know exactly how much their family spend on every category of product and service. Even though they are price conscious, they often invest in accounting or advisory services to plan and manage their expenses, with the goal of freeing up at least 15% of their pre-tax income each year for investments. 95% of the millionaires surveyed own stocks; however, they are typically investors, and not speculators who follow the stockmarket fluctuations closely.

They don't squander their resources. Instead of spending time, energy and money shopping for luxury items or even hunting for great bargains, PAWs divert their focus to learning about the various investment options and market offerings. Rather than waste time and energy worrying about their finances, they actually manage expenses, invest time and take action for their planning and investments.

They minimize their "realized income". You can only spend when you have "realized income" which is taxable, i.e. every dollar you earn to spend is first discounted by the taxman. To build wealth, minimize your realized income and maximize your unrealized income (i.e. appreciable assets without a cash flow).

KEY QUOTES

"Remember, wealth is blind. It cares not if its patrons are well educated."

"UAWs spend more time worrying about these (financial) issues than taking proactive steps to change their tendencies to overconsume and underinvest."

"Operating a household without a budget is akin to operating a business without a plan, without goals, and without direction."

"There is an inverse relationship between the time spent purchasing luxury items such as cars and clothes and the time spent planning one's financial future."

"A couple cannot accumulate wealth if one of its members is a hyperconsumer."

3. Financial Independence, Not Wealth Artifacts

Wealthy people prioritize achieving financial independence over displaying a high social status. In fact, they recognize that many status artifacts can be a burden or hindrance to their financial goals.

More than half the millionaires interviewed never paid more than $30,000 for a motor vehicle, and most never spent near $65,000 for one. The average millionaire in the book drove a second hand, American-built large family car, the Aussie equivalent being a Falcon, Commodore or maybe a similar four-wheel drive.

Most millionaires have lived in the same neighborhood for generations. It's much easier to accumulate wealth if you don't live in a high-status neighbourhood. Stanley and Danko advise that, if you're not yet wealthy (but want to be), do not buy a home that requires a mortgage of more than twice your household's total annual realized income.

Most PAWs love what they do and how they live. They don't change their lifestyles nor values when they become affluent. UAWs on the other hand tend to work only because they need to support their lifestyle and spending habits. Hence, despite their seemingly boring and simple lifestyles, these financially independent people are actually happier than their UAW counterparts with a high-consumption lifestyle but no financial security.

4. No "Parental Economic Support"

It is common for parents and grandparents to offer economic gifts and "acts of kindness", such as paying for the children or grandchildren's private school tuition fees, home mortgages, or transferring income-producing real estate or securities to their adult children. In the book, the authors refer to these as "Economic Outpatient Care" or EOC.

More than 46% of the affluent in America give at least $15,000 worth of EOC annually to their adult children and/or grandchildren.

While they do so to improve their children's living circumstances, or to give their grandchildren a strong foundation, they may

KEY QUOTES

"If your goal is to become financially secure, you'll likely attain it.... But if your motive is to make money to spend money on the good life... you're never gonna make it."

"It's much easier...to earn a lot than it is to accumulate wealth."

"There are some things that are more fun to do...more interesting to do [than owning a Rolls]."
- One of the millionaires surveyed

unintentionally create economic dependency. After all, it's much easier to spend other people's money than your own.

However, not all EOCs are bad – the key is to ensure your gifts strengthen your children's foundations for financial independence, rather than encourage consumption beyond their means.

Millionaires whose offsprings grow up to be UAWs typically make the mistake of subsidizing their adult children's lavish lifestyle. Cash gifts that are intended for consumption often prop up an otherwise-unsustainable lifestyle, encourage unproductive behaviour and the development of poor financial habits.

If your adult children cannot afford an expensive house in a premium district, you may feel tempted to help them with their down-payments or mortgages. Besides the housing costs, there are also unnecessary expenses associated with such neighourhoods e.g. higher cost of goods and services, pressure to send the children to private schools or to display artifacts of wealth. They will inevitably learn to live beyond their means.

Research shows that gift receivers are more likely to turn to credit for short-term cashflows, and generally invest less than non-receivers. They are not sensitized to the real cost of living and have a distorted perception of the value of money and poor financial discipline. For example, a $10,000 tax-free cash gift is equivalent to 8% returns from $125,000 of investments – which means $125,000 of capital that your child never had to save. Worse still, many of them consider themselves to be self-made: they do not realize how far their parents' EOC has been assisting them and feel that their lavish lifestyle was self-earned. Once these cash gifts are withdrawn, they are unable to cope with their own finances.

Instead, millionaires whose children become PAWs teach their children how to fish, as elaborated in the next segment.

5. Nurture Self-sufficient Adult Children

Most affluent, well-informed parents would want to progressively reduce the size of their estate before they pass away, so they can share the wealth with their children without leaving them with a

KEY QUOTES

"Cash gifts are too often earmarked for consumption and the support of an unrealistically high lifestyle... giving of such gifts is the single most significant factor that explains lack of productivity among the adult children of the affluent."

"In general, the more dollars adult children receive, the fewer they accumulate, while those who are given fewer dollars accumulate more."

huge estate tax liability. They would likely have been advised to minimize estate taxes via annual gifts to their children.

Yet, as mentioned earlier, there's an inverse relationship between the economic success of the offspring and the amount of EOC and inheritance received. In fact, the most productive offspring of millionaires received no economic gifts at all from their parents.

After examining a range of "good" and "bad" case studies, the authors summarise how wealthy people raise economically successful offspring:

- **They do not tell the children that they are wealthy.** Many of the first-generation millionaires are so frugal that their PAW children don't know they are wealthy. They ensure the children demonstrate maturity, discipline, an established lifestyle and profession first before revealing their affluence (e.g. disbursing cash gifts from their trusts only when the children are 40 years old). They never openly discuss what the children or grandchildren will inherit or receive.

- **They inculcate the right values and thinking.** Regardless of their affluence, they lead by example to instill discipline and frugality in their children. They reinforce that there are more valuable things than money in life, and focus on their children's achievements (no matter how small) instead of symbols of success. They also help their children to deal with their weaknesses (rather than trying to protect them from failure). They understand that when you are the best in your field, the money will follow.

- **They nurture their children as unique individuals,** and avoid using economic gifts to "equalize" them (e.g. supporting the weaker children through cash gifts). They don't "compete" with their children, nor impose their vision or ideals on their adult children. In fact, they may seek the recipients' agreement before dishing out substantial gifts. Instead of directly subsidizing their children's lifestyle through cash gifts, they may invest in the right education, provide gifts to help them start or enhance a business, or even give private stock which cannot be readily cashed out for luxury purchases.

KEY QUOTES

"Many parents still think that their wealth can automatically transform their children into economically productive adults They are wrong. Discipline and initiative can't be purchased like automobiles or clothing off a rack."

"Teach your children to achieve, not just to consume. Earning to enhance spending should not be one's ultimate goal."

"Be tough ... life is. In other words, there is no promise of a rose garden."

6. Leverage Market Opportunities

The affluent surveyed in this book – especially the self-made ones - accumulate wealth because they actively target and pursue market opportunities. Although they are price-sensitive about consumer products and services, they invest in relevant services like investment, accounting, tax and legal services, medical and dental care. Business owners also purchase business-related products and services. Often, those who supply such services to the affluent also become wealthy.

With the rising amount of affluence in America, there will be huge business opportunities for those who target the affluent, the children of the affluent, and the widows of the affluent. Some examples include finance and legal services (e.g. estate attorneys, tax and accounting services), immigration specialists, medical and dental care specialists (e.g. dermatologists, plastic surgeons, chiropractors), asset liquidators and appraisers (to evaluate gifts e.g. gems, antiques, art/ coin/ other collections etc.), educational professionals, housing specialists (e.g. home building contractors, mortgage brokers).

7. Choose the Right Vocation

Most of the affluent in America are business owners, including self-employed professionals.

- The most successful business owners all enjoy what they do. They take pride in overcoming their fears and challenges in business, set high standards, and demonstrate great discipline. Their success in business also helps many of their employees and investors to become wealthy. Hence, Stanley and Danko find it offensive when people claim they can "teach" others to become wealthy quickly through simplistic business home-study kits.

- However, less than 20% of these successful business owners pass their businesses to their children. Many even advise their children against business. This is because they understand that businesses come with risks, including changing consumer and market trends, competition and regulations. Instead, many of the millionaires advise their children - especially if their children are academically inclined - to become self-employed professionals, e.g. doctors, attorneys, architects.

KEY QUOTES

"We believe that in the next twenty years, the affluent will have to use every option within the law to remain affluent. It is a segment of our economy that will be under siege by the liberal politician and his friend, the tax man."

"The character of the business owner is more important in predicting his level of wealth than the classification of his business...it's not the kit, not the idea, not the industry."

"Courageous people, entrepreneurs, recognize the fear in what they are doing. But they deal with it. They overcome their fears. That's why they are successful."

- While there was no clear predictor of which types of business generated more millionaires, most of the affluent business owners interviewed were in "dull" but stable businesses.

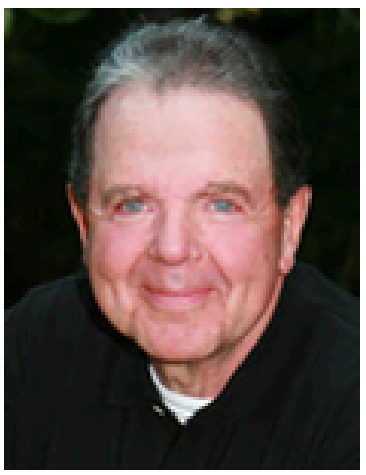
In short, the average people next door became millionaires because they chose the right occupation, faced their fears courageously and handled their money well with great financial discipline and frugality. These were what made them the millionaire next door.

Other useful details in the book to look out for

This book was first published in 1995, and the business and societal landscape has obviously changed significantly in today's internet age. However, these findings are a powerful reminder of how the average person can become a millionaire through a few (timeless) disciplines and principles, and how accumulated wealth can easily be lost by those who inherit them.

The book is presented mainly through examples and excerpts of the authors' numerous interviews and surveys, giving the reader good insights into how the first-generation self-made millionaires think and make their decisions. The book also includes numerous tables and statistics, breaking down the income and expenditure amounts, time allocation, mean earnings, types of businesses etc. associated with the millionaires studied.

About the Authors

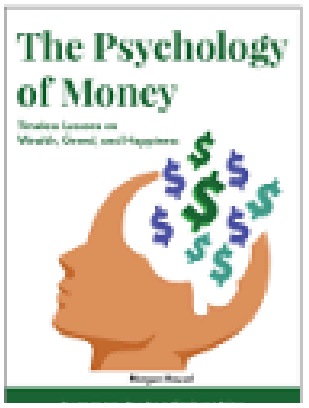


Dr. Thomas J. Stanley (1944-2015) was an American writer and business theorist. He received a doctorate in business administration from the University of Georgia, and was on the faculty of the University at Albany, State University of New York. He taught at the University of Tennessee, University of Georgia and Georgia State University (where he was named Omicron Delta Kappa's Outstanding Professor).

KEY QUOTES

"Courageous people, entrepreneurs, recognize the fear in what they are doing. But they deal with it. They overcome their fears. That's why they are successful."

"Dull companies with steady earnings growth may not make for stimulating cocktail party chatter, but over the long term they make the best investments"
- Meeks & Fomdiller, Forbes



THE PSYCHOLOGY OF MONEY

Timeless Lessons on Wealth, Greed, and Happiness

MORGAN HOUSEL

The Big "So What"

Many finance books focus on the technical aspects of money and investment, e.g. how to select stocks or build a portfolio. In this book, Housel addresses the often-neglected fact that we are irrational, emotional beings, not ROI-optimizing machines. Your financial success depends more on your soft skills (how you manage your psychology and emotional impulses) than your technical skills on financial analyses, market rules/laws.

Introduction

Housel has been writing about finance since 2008. Through his research, he realized that luck and human behaviors play a much bigger role in determining one's financial success than spreadsheets and analyses.

- For example, gas station attendant and janitor Ronald James Read managed to amass $8 million over his lifetime by saving what he could and investing his money steadily in blue chip stocks. By contrast, Harvard graduate and Merrill Lynch executive Richard Fuscone went bankrupt during the 2008 financial crisis after spending extravagantly and borrowing heavily.

In this book, Housel shares his discoveries, beliefs and approach to money. Through a series of short stories and chapters, he presents 18 related biases, flaws, behaviors or attitudes that affect your financial outcomes. These jointly make up the psychology of money.

KEY QUOTES

"Soft skills are more important than the technical side of money."

"Physics isn't controversial. It's guided by laws. Finance is different. It's guided by people's behaviors."

"Doing well with money has a little to do with how smart you are and a lot to do with how you behave."

"Financial success is not a hard science. It's a soft skill, where how you behave is more important than what you know. I call this soft skill the psychology of money."

Understanding the Psychology of Money

In this section, we've organized the 18 overlapping concepts into 3 main themes.

Know Your Gaps, Limitations And Biases

We think we know how the world works, but our worldview is actually very limited. Each of our personal experiences reflect just a tiny fraction of the collective human experience over the generations.

- Our worldview is shaped by our life experiences. So, people from different generations, background and life experiences *perceive money differently*. Someone who grew up with poverty/starvation will interpret "risks" and "rewards" differently from someone from a wealthy family who never had to worry about money. Someone who survived WWII or lived through a recession would see money in a different light from someone who grew up in a stable economy.

- Others' financial decisions may seem crazy to you, but it makes perfect sense to them. You'll never understand someone's *financial insecurities* just by reading about it; you must experience it personally to fully grasp it.

- Although money has been around for thousands of years since 600 BC, most of our *modern investment/ financial tools* are actually very new. For example, USA's 401(k)—the backbone of their retirement planning—was introduced in 1978, and the Roth IRA was added only in 1998. Even index funds were developed only in the 1970s. We've only had <50 years to master these new tools/concepts, making us collectively inexperienced in the modern money game.

We always have incomplete data on a situation. Yet, we don't realize what we don't know because our brains create stories to fill the gaps.

KEY QUOTES

"We all think we know how the world works. But we've all only experienced a tiny sliver of it."

"Every decision people make with money is justified by taking the information they have at the moment and plugging it into their unique mental model of how the world works."

"People do some crazy things with money. But no one is crazy."

"Your personal experiences with money make up maybe 0.00000001% of what's happened in the world, but maybe 80% of how you think the world works."

- This gives us an *illusion of understanding, certainty and control*, which is psychologically comforting but leads to bad decisions:

  (i) During planning, we focus on what we can/want to do, neglecting other factors beyond our control.

  (ii) We over-emphasize the impact of our skills and discount the role of luck or random events.

  (iii) We become overconfident of our beliefs and knowledge. Even historians' accounts of history are biased because they look for facts and interpretations that confirm their opinions.

- Such stories are powerful enough to *drive the economy*. During a market bubble, people keep buying because they tell themselves that prices will keep rising. When the bubble bursts, people pull out of the market and tell themselves the future is bleak.

- Realize how much you don't know and can't control, and *beware the stories you tell yourself*. If you want something to be true, you're more likely to believe a story that exaggerates its probability. Just because you *want* your investment to double in 1 year doesn't make it more likely to happen. In reality, from 2008-2017, 85% of active mutual funds fell short of their benchmark.

We tend to over-emphasize skills and effort, when outcomes are often influenced more by **luck and risk**.

- No success/failure is purely due to *hard work or sound decisions*. Your circumstances define the opportunities available to you. Every action you take also has unintentional ripple effects. Take Microsoft for example. Bill Gates was smart, hardworking, and had a rare affinity with computers. However, he was also lucky to attend one of the only high schools in his time with a computer (which Housel estimates to be a 1 in a million chance). Gates eventually co-founded Microsoft with his classmate Paul Allen. They had a close friend, Kent Evans, who shared their skills and passion with computers. Yet, Evans wasn't a part of Microsoft because he died on a mountaineering accident, another rare event. Both Gates and Evans were smart and loved computers, but they fell on 2 extreme ends of luck and risk.

KEY QUOTES

"The illusion of control is more persuasive than the reality of uncertainty."

"Hindsight, the ability to explain the past, gives us the illusion that the world is understandable."
—Daniel Kahneman

"The more you want something to be true, the more likely you are to believe a story that overestimates the odds of it being true."

"The accidental impact of actions outside of your control can be more consequential than the ones you consciously take."

"Realize that not all success is due to hard work, and not all poverty is due to laziness."

- Luck and risk exist in every situation. *To be more objective*:

  (i) Don't draw conclusions from extreme examples, since they're likely to be strongly influenced by luck/risk and hard to replicate. Look for *broader patterns* across many cases. For example, it's hard to be the next Warren Buffett, but it's much easier to achieve time and money freedom.

  (ii) Remember: *things are never as good or as bad as we think*. Don't be too quick to judge people, including yourself. Nothing (e.g. hard work, pride) is 100% good or bad. When things are going well, know that you're not invincible. When things are going badly, know that you're not a disaster.

A small number of events influence the bulk of our outcomes.

- A handful of *unexpected outlier events*, e.g. WWII, the invention of antibiotics or the internet, can change the course of history.

- We often hear about things that're unusually big, profitable or impressive. Such mega-successes are actually extremely rare and *we underestimate how often things/people fail*. For example, Disney made >400 loss-making cartoons before making a windfall with Snow White and the Seven Dwarfs. Heinz Berggruen amassed lots of art pieces, of which only a small portion turned out to be prized assets. Venture capitalists lose money with most of their investments, but recoup their earnings from the top 3-4% of startups.

- *Don't over-react to failures*. You can be wrong about half your investments and still make lots of money. If you consistently invest small amounts of money over a long time regardless of market conditions, you'll outperform the majority of people who pick stocks or move their investments in/out of the market.

History can help us to learn what worked/didn't work, and how to manage our expectations. However, past data/ trends cannot accurately predict the future.

- That's because historical data cannot capture:

KEY QUOTES

"The world is too complex to allow 100% of your actions to dictate 100% of your outcomes."

"Nothing is as good or as bad as it seems."
—Professor Scott Galloway

"Long tails—the farthest ends of a distribution of outcomes—have tremendous influence in finance, where a small number of events can account for the majority of outcomes."

"A good definition of an investing genius is the man or woman who can do the average thing when all those around them are going crazy. Tails drive everything."

"Historians are not prophets."

(i) Changes in people's *stories and preferences*, which drive their financial decisions;

(ii) *Outlier events* (e.g. WWII, the 2008 financial crisis) which are recording-breaking, with no precedents and no way to predict their details or ripple effects.

(iii) *Structural changes* in societies and economies that disrupt past trends/norms. For example, business financing, accounting rules, and hiring practices have changed drastically in the last 50 years. Changes like the internet, venture capital and crowd-funding have also made many old business practices obsolete.

- So, the farther the historical analyses, the more generic the conclusions must be.

Pessimism is more prevalent, but there's cause for optimism.

- Bad news and forecasts of doom/disaster are more *attention-grabbing*. The world seems worse than it is because:

(i) The news media play up bad news more than good ones.

(ii) It's human nature to react more dramatically to potential losses/threats than to potential gains/ opportunities.

(iii) We notice setbacks/disasters more as they may happen overnight from a single point of failure, whereas growth/ progress tends to happen gradually. The invention of airplanes over the years changed history, yet it's not as sensational as a plane crash that killed everyone on board.

- In reality, *things are getting better in the long run*. Optimism is the belief that you have a good chance of positive outcomes in the long term despite short-term setbacks.

(i) Analysts and experts tend to make pessimistic forecasts based on current trends, without taking into account new *innovations and market adaptations*.

(ii) Human beings are *resilient and innovative*. Pain and problems motivate us to come up with new, novel

KEY QUOTES

"This is not a failure of analysis. It's a failure of imagination."

"The correct lesson to learn from surprises is that the world is surprising."

"Optimism sounds like a sales pitch. Pessimism sounds like someone trying to help you."

"Progress happens too slowly to notice, but setbacks happen too quickly to ignore."

solutions. In the 1970s, it was forecasted that we'd run out of oil given our consumption levels and the rapid population growth. Yet, this didn't happen because we improved fuel-efficiency and developed innovative ways of fuel-extraction. Japan was in ruins at the end of WWII, yet it managed to recover strongly.

We're not computers or spreadsheets. We're human beings with irrational feelings. So, don't try to be coldly rational in your financial decisions; it won't work. Instead, aim to be mostly reasonable, taking into account your human tendencies.

- In theory, you should go for riskier investments when you're young, since you'll still have time to start afresh if you lose everything. But in reality, if you lose everything, you'll probably quit and switch to another strategy.

- Your historical odds of positive returns in the U.S. markets are 68% in 1 year, 88% in 10 years, and 100% in 20 years. Instead of trying to beat the market through short-term speculations, you're better off if you can stick around long enough for your investments to pay off.

Adopt a Survival Mindset and Leverage Compounding

Warren Buffett may be a brilliant investor, but his biggest secret isn't his investment strategy or formula; it's time. Unlike most people, he started investing when he was 10 years old, so by the time he was 30 (when most people start investing), he already had a net worth of $1 million. Even so, $81.5 billion of his $84.5 billion net worth came after his 65th birthday. *That's* the power of compounding and time.

- Scientists now estimate that there were 5 ice ages in Earth's history (not just one). They theorize that a small sliver of ice left over from a cool summer is enough to trigger *compounded changes* in global temperatures to cause an ice age.

- Compounding only works if you can give an asset years to grow, like an oak tree slowly reaching maturity. You don't need high returns; you need *decent and consistent returns*.

KEY QUOTES

"Aiming to be mostly reasonable works better than trying to be coldly rational."

"Investing has a social component that's often ignored when viewed through a strictly financial lens."

"Time is the most powerful force in investing."

"If something compounds—if a little growth serves as the fuel for future growth—a small starting base can lead to results so extraordinary they seem to defy logic."

(i) Don't take big risks in hope of getting the highest-possible returns. Go for decent returns that can be sustained over a long time.

(ii) Extend your time horizon: start as early as possible, and wait for the money to grow.

Getting wealthy ≠ Staying wealthy.

- There're many ways to acquire money, most of which require you to take some risks. However, once you have the money, the only way to keep it is through a blend of *frugality and caution*. Realize that you may not be able to replicate your earlier success, and could easily lose the money you have. So, be as frugal and cautious as possible. After all, there are very few things worth the risk of wiping yourself out.

- Adopt a *survival mindset* by doing 3 things:

(i) Aim to be *financially unbreakable* so you can stick around long enough for compounding to work. Remember: you don't need high returns; you just need consistent and uninterrupted returns over a long period of time.

(ii) Expect that things won't go according to plan. Build in a *margin of error* and always live within your means.

(iii) Have a *barbelled personality*: be optimistic about the future, yet paranoid about the obstacles that could get in the way.

No matter how thorough your plans are, things will still turn out differently. So, always plan based on probabilities (not certainty) and include a margin of safety. This will prepare you for a wider range of outcomes. In Microsoft's earlier days, Bill Gates aimed to set aside a full year's payroll as a financial buffer. Likewise, Warren Buffett always ensures that Berkshire Hathaway has more than ample cash.

- Cater for *volatility* in your investment plans. For example, can you survive (both technically and emotionally) if your assets fall by 30%?

- In your retirement plans, build some buffers into your *expected returns*. You can aim for 8% return rates, but

KEY QUOTES

"Getting money is one thing. Keeping it is another."

"There's only one way to stay wealthy: some combination of frugality and paranoia."

"Good investing is not necessarily about making good decisions. It's about consistently not screwing up."

"The most important part of every plan is planning on your plan not going according to plan."

"The first rule of compounding is never interrupt it unnecessarily."
– Charlie Munger

make sure you'll be ok with just 4%. To be conservative, Housel assumes that his long-term returns will be a third lower than historical rates.

- Never gamble with every dollar you have. Even if something has a 98% chance of success, you still face a 2% risk of failure. Adopt a *barbelled approach* to money by setting aside a portion of your funds for riskier investments, and safeguarding the rest.

- To minimize the damage from potential disasters, avoid *single points of failure*, such as having a single source of income.

- Set aside some *rainy-day funds* or savings for unexpected events.

Everything has a price, though not necessarily in monetary terms. **Be willing to pay the price** for financial success.

- Market returns don't come for free. Higher returns tend to come with higher risks—and with it, the price of *uncertainty, doubt and potential regret*. When you invest for the long term, you must be prepared to accept short-term market fluctuations.

- Think of market volatility as a *fee for investment*, not a loss, fine or penalty. After all, we willingly pay for good food, cars, houses and vacations. Why not pay a fee for good investment returns?

Know and Focus on your Financial Goals

One of the hardest things to do is to **stop shifting your goalpost**. We hear of people who already have unimaginable amounts of wealth, power and prestige, yet end up in ruin because they allow greed to get the better of them.

- *Don't compare with others* since there'll always be someone who has more than you. If your ambition and expectations continually outgrow your satisfaction levels, you'll never be happy.

- *Enough ≠ too little*. The opposite of "enough" is to be insatiable to the point of regret. Know when to stop

KEY QUOTES

"You should be risk loving and yet completely averse to ruin."
—Nassim Taleb

"Everything has a price, but not all prices appear on labels."

"Define the cost of success and be ready to pay for it. Because nothing worthwhile is free."

"The hardest financial skill is getting the goalpost to stop moving."

"Happiness, as it's said, is just results minus expectations."

pursuing more. There's no point losing what you have (e.g. reputation, freedom, love, happiness) for what you don't need.

Studies have found that the most important factor behind people's happiness is the sense of control over one's life, not material factors like the size of their salary, house or status.

- Money is important not because it allows you to buy luxury goods, but because it has the potential to buy you *time and the freedom of choice*. Being independent doesn't mean you must stop working. It simply gives you the flexibility to choose what work to do, when you do it and with whom you do it with. The highest level of wealth is the ability to choose what you want to do when you wake up each morning.

People seek wealth and status to signal how successful they are. Ultimately, what they want is others' respect and admiration.

- Unfortunately, *you won't gain respect by flaunting your wealth*. We may admire a nice car and imagine how cool it'd be if we could drive that car, but we don't notice the drivers. People will envy your possessions, not you. The best way to be liked, respected and admired is to be kind, humble, and empathic.

People want to be millionaires because they want to spend a million dollars. Yet, spending a million dollars is literally the opposite of being a millionaire, since wealth = the amount of money you don't spend.

- Know the *difference between being "rich" vs "wealthy"*:

  (i) Rich people have high incomes, and they spend it on big homes and fancy cars. Their display their buying power.

  (ii) Wealthy people keep their money, and use it to increase their options and buying power in the future.

- To be wealthy, you need the *discipline to focus on your longer-term goal*. Resist the temptation to spend the money now, either to flaunt it or to enjoy something immediately.

KEY QUOTES

"There's no reason to risk what you have and need for what you don't have and don't need."

"The ability to do what you want, when you want, with who you want, for as long as you want, is priceless. It is the highest dividend money pays."

"No one is impressed with your possessions as much as you are."

"The only way to be wealthy is to not spend the money that you do have...it's the very definition of wealth."

"Spending money to show people how much money you have is the fastest way to have less money."

Your savings rate matters more than your income or investment returns, and it's fully within your control. Someone who earns $20,000 but saves/invests $5,000 will be much wealthier than someone who earns $100,000 and saves/invests $1,000.

- The best way to increase your savings is to *decrease your ego*. The most financially-resilient people don't earn the most; they simply don't waste money to impress others.

- Don't save money just to buy a house or car; *save as a good habit*. More savings mean more money to compound, more flexibility/control over your time, and more financial buffers during tough times, e.g. you can hold on to your investments or wait for better opportunities instead of being forced sell them out of desperation.

Our dreams, priorities and personality will change we age and experience life. What we want and need today will not be the same as what we want and need in 10, 30, or 50 years.

- In your financial planning, *avoid the extremes*, e.g. don't assume you'll be ok with very low income, or to work long hours for more money.

- *Accept that your priorities will change*. Don't allow sunk costs (past efforts or investments) to tie you to the past. Accept that you've changed your mind, and move on.

- Leverage the power of compounding in all aspects of your life. At every point in your life, consistently *invest in the things that matter* to you, e.g. set aside some savings, time for yourself and with your loved ones.

Someone who's investing with a 30-year horizon should approach the market differently from someone with a 1-year or even a 1-day horizon. Don't blindly follow others, since they may be playing a totally different financial game than you.

- *Market bubbles* occur partially because people take financial cues from others. Many "investors" are actually speculators hoping to make a quick buck. Short-term traders (e.g. people doing same-day stock-trading) are attracted by short-term momentum. As more of such traders enter a market, bubbles start to form. Once the

KEY QUOTES

"Past a certain level of income, what you need is just what sits below your ego...Less ego, more wealth."

"Building wealth has little to do with your income or investment returns, and lots to do with your savings rate."

"Long-term planning is harder than it seems because people's goals and desires change over time."

"Beware taking financial cues from people playing a different game than you are."

"Bubbles aren't so much about valuations rising. That's just a symptom of something else: time horizons shrinking as more short-term traders enter the playing field."

momentum is lost, these traders will exit the market. Long-term investors will suffer if they follow suit.

- Most *analysts'* stock recommendations are also made without considering your personal investment goals. When you see a doctor, you'd expect him to do a proper diagnosis before recommending a treatment. Likewise, only consider financial advice tailored to your financial goals.

- *Get clear on the game you're playing*. To stay focused, try writing down a mission statement for your investments. For example, Housel's statement was: "I am a passive investor optimistic in the world's ability to generate real economic growth and I'm confident that over the next 30 years that growth will accrue to my investments."

KEY QUOTES

"There is no single right answer; just the answer that works for you."

Putting it Together

Here's a quick recap of the key ideas which we've consolidated into the 3 sections above:

Chapter title in the book	Key idea
No one's crazy	People have different views about money
Luck & risk	Luck/risk have a bigger impact than skills
Never enough	Learn to stop shifting the goalpost
Confounding compounding	Leverage the power of compounding
Get wealthy vs. Stay wealthy	Getting wealthy ≠ staying wealthy
Tails, you win	Be ok with failures—they're the norm
Freedom	Freedom is invaluable
Man in the car paradox	Money doesn't buy respect
Wealth is what you don't see	Riches are displayed; Wealth is hidden
Save money	Less ego → more savings
Reasonable > rational	Be reasonably sensible (not coldly rational)
Surprise!	The past doesn't predict the future
Room for error	Have a margin of safety
You'll change	Expect your future self to change
Nothing's free	Be willing to pay the price for success
You & me	Know and play your own game
The seduction of pessimism	There's cause for optimism (in the long run)
When you'll believe anything	Beware your stories

There's usually a gap between what people advise you to do and what they'd do themselves. Housel ends off by sharing his family's financial approach. In a nutshell:

- They only have *1 main financial goal: independence* or the ability to do what they want on their own terms. They're contented with a decent house, a car, and a modest lifestyle. As their income increased over the years, they saved most of it because they were already comfortable with their lifestyle. They enjoy free/low-cost activities like exercising and reading, and don't see the need to spend money to impress others. In short, they stopped moving their goalpost.

- In fact, they bought their house without a mortgage. This makes no financial sense, but it gives them a *peace of mind* which they value above all else. Housel also maintains 20% of his assets (besides his home) in cash as a safety net.

- Housel started out as a stock-picker but no longer invests in individual stocks. All his stock market investments are now in *low-cost index funds*. So long as he's financially independent, he doesn't care whether he beats the market or maximizes his returns.

The approach above works for Housel, but it may not work for you. The key is to get clear on your own goals, design your own game accordingly, and manage your relationship with money so you can have a happy and fulfilling life.

Other Details in the Book to Look out For

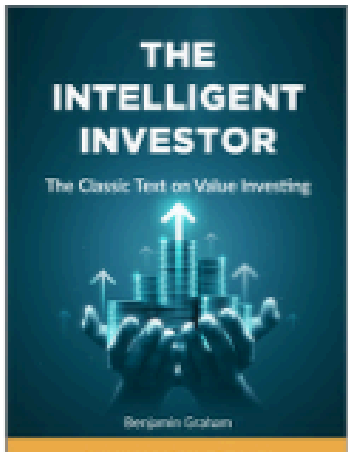
Housel presents short stories and empirical research to explain each of the overlapping concepts above. The book also includes a postscript about why consumers in the USA think the way they do. For more details and articles by Housal, please visit www.collaborativefund.com.

KEY QUOTES

"Cash is the oxygen of independence."

"Having more control over your time and options is becoming one of the most valuable currencies in the world."

"Every investor should pick a strategy that has the highest odds of successfully meeting their goals."



THE INTELLIGENT INVESTOR

The Classic Text on Value Investing

Benjamin Graham

The Big "So What"

This book is considered a bible in the world of value investing. It provides invaluable insights on adopting a disciplined, rational investment approach, to focus on the intrinsic value of a company instead of market speculation.

What's Intelligent Investing?

Warren Buffett is well-known for his concept of value investing, which originated from Graham's teachings on **intelligent investing**. This is not about having a high IQ or mastering financial techniques, but having the knowledge, principles and mindset to be an astute investor. The goal is not to beat the market or to get rich overnight, but to build wealth in a steady, consistent way.

Although Graham first published this book decades ago, the **timeless principles** remain relevant today.

- In this summary, we've streamlined and organized the content into *3 sections*:

  (i) Foundational Principles of Intelligent Investing;

  (ii) The 2 Investment Pathways; and

  (iii) Other Investment Insights.

KEY QUOTES

"The purpose of this book is to supply, in a form suitable for laymen, guidance in the adoption and execution of an investment policy."

"Sound investment principles produced generally sound results. We must act on the assumption that they will continue to do so."

Foundational Principles of Intelligent Investing

Invest, Don't Speculate

There's a major difference between investment and speculation.

- An *investment* is based on robust analysis, with the goal to preserve your principal and obtain sufficient returns in the long term. For example, you may buy a stock after analyzing the company's financial health and future potential.

- Anything that's not an investment is a *speculation*, such as buying a trending stock in hopes that its price will go up, or acting based on an unverified "tip".

- The *goal of intelligent investing* isn't to outperform the market every year. It is to:

  (i) Achieve steady, positive returns over time; and

  (ii) Preserve your principal by avoiding severe losses. If you lose $90,000 out of $100,000 investment capital, you'd need returns of 900% just to recoup your initial amount.

Speculation isn't "bad". The danger lies in confusing speculation and investment—to think you're investing when you're speculating and exposing yourself to unnecessary risks.

- If you wish to try your hand at speculation, Graham recommends *keeping separate accounts*: one for genuine investments and a smaller account for speculative activities. This limits losses from speculations, and keeps you from muddling your investment strategy with speculative bets.

Focus on Real Returns After Inflation

Inflation erodes your money's purchasing power over time. If your investment returns are lower than inflation rates, you are effectively losing wealth.

- Imagine you have $100, and inflation is 5% per annum. In a year, even if your money grows to $102, its purchasing

KEY QUOTES

"If you've failed at investing so far, it's not because you're stupid...It's because...you haven't developed the emotional discipline that successful investing requires."
— Jason Zweig

"If you want to speculate do so with your eyes open, knowing that you will probably lose money in the end."

"Never mingle your speculative and investment operations in the same account, nor in any part of your thinking."

power is only comparable to $95 from the previous year due to inflation. So, you've actually lost value in real terms.

Assets (e.g. bonds, stocks, property) may be used to hedge against inflation, i.e. build an asset portfolio whose value appreciates more than the rate of inflation in the long run. To this end, Graham discussed different types of assets:

- *Bonds and fixed-income instruments*: Bonds are loan agreements between a lender and an entity (e.g. government or company). They guarantee periodic interest payments and the return of your principal at a specified maturity date. Bonds are typically seen as a safe form of investment. However, their returns may be lower than inflation rates during periods of high inflation, leading to negative real returns.

- *Stocks, shares, or equity*: These represent ownership in a company. They give you a claim on a portion of the company's assets and earnings, and may come with dividends as a share of company profits. Historical data suggests that stocks tend to outperform inflation in the long term.

- *Other tangible assets* (e.g. real estate, gold, or collectibles) can also retain value during inflationary times. Like all investments, they come with their own risks, e.g. gold doesn't provide ongoing income and may incur storage costs, while the prices for artwork can be unpredictable.

It's impossible to predict the rate of inflation or the future performance of any asset class. So, the best way to counter inflation is to have a diversified portfolio with various assets, and to regularly review and adjust your portfolio.

- Always think in terms of real returns, i.e. returns after accounting for inflation. If your investment returns are 7% and inflation is 5%, your real return is just 2%. To grow your wealth, you need investments with *positive real returns*.

- *Stay vigilant*: regularly assess the economic landscape and adjust your strategy to address changes in inflation rates.

KEY QUOTES

"Just because of the uncertainties of the future the investor cannot afford to put all his funds into one basket."

Understand the Stock Market History

A good investor should understand the history and performance of financial markets. In the book, Graham analyzed a century of stock market data, emphasizing the need to understand (i) price fluctuations, and (ii) the relationship between stock prices, earnings and dividends.

- From 1871-1971, the stock market went through several highs (e.g. the Roaring Twenties) and lows (e.g. the Great Depression), punctuated by short-term volatility. Investors should expect such *cycles and fluctuations*, and realize that it's hard to predict short-term market direction. For example, back in 1927, it was nearly impossible to foresee whether the market would rise or fall.

- In the long-term, the market showed a *general upward trajectory* to provide solid returns. Graham attributed this to a combination of 3 things: (i) inflationary growth, (ii) real growth in companies' earnings and dividends, and (iii) speculative growth linked to people's appetite for stocks.

  (i) While *inflation* affects stock appreciation, it's not a key driver. For a true measure of their returns, investors should adjust for inflation.

  (ii) A bigger driver was the *real growth* in companies' earnings and dividends. Dividends, especially when reinvested, played a major role in compounding growth.

  (iii) Stock prices can fluctuate wildly due to *irrational speculation*, often bearing no relation to the stock's intrinsic value.

KEY QUOTES

"Prudence suggests that [the investors] have an adequate idea of stock-market history, in terms particularly of the major fluctuations in its price level and of the varying relationships between stock prices as a whole and their earnings and dividends."

"The only thing you can be confident of while forecasting future stock returns is that you will probably turn out to be wrong."
—Jason Zweig

- In sum, markets experience ups and downs, but they generally yield positive returns in the long haul. This presents a few *takeaways for investors*.

  (i) Given the long-term market uptrend, it makes sense to adopt a consistent, long-term investment strategy.

  (ii) Short-term market fluctuations and speculations also create gaps between stock prices and their intrinsic value, offering opportunities for savvy investors to profit from mispriced stocks—to buy undervalued stocks and sell overvalued ones.

  (iii) The real challenge is to implement these strategies rationally, without being swayed by market hype or speculation.

Manage your Responses to Market Fluctuations

Price fluctuations are inevitable in the market.

- *Stocks*: Often, a stock's market price is driven by speculation, and doesn't reflect its true business value. The more successful a company, the greater its stock price fluctuations due to heightened speculation.

- *Bonds*: Bond have a fixed maturity date and interest rates, but their market prices can vary due to changes in interest rates, shifts in the issuer's creditworthiness, and other market dynamics.

- Historically, good-quality stocks delivered *average returns* of about 10% annually. Bonds, being less risky, yielded average returns of close to 5%. However, past trends may not predict future performance.

A key difference between investors and speculators lies in their response to stock market movements. Speculators try to make a quick profit by second-guessing short-term market shifts, while intelligent investors make strategic buy/sell decisions based on the intrinsic value of the securities. Specially, intelligent investors consider both timing and pricing:

KEY QUOTES

"Every investor who owns common stocks must expect to see them fluctuate in value over the years."

"Common stocks may do better in the future than in the past, but they are far from certain to do so."

- *Timing*: They don't rush to buy or sell. They grasp market trends, buying when the market is moving upward, and selling or holding when the market is moving downward. They only sell a stock if they expect to repurchase it at a much lower price in the future.

- *Pricing*: To avoid over-paying, they aim to buy low (below value) and sell/hold when prices are high (above value).

Think of the stock market as an erratic business partner "Mr. Market". Some days he's overly optimistic, offering to buy your stakes at exorbitant prices. Other days he's pessimistic, proposing to sell his shares at a steal.

- The *wise strategy* is to maintain your independent view of your stock's true value, then exploit Mr. Market's mood swings: buy from him when he undervalues his stocks and sell to him when he overvalues them.

However, even the most astute investor can be swayed by emotions or market hype. Thus, you need to mitigate your impulses using several safeguards:

- Go for a *margin of safety*: buy a security (e.g. stock or bond) only if its market price is significantly below its intrinsic value. This cushions against unexpected market downturns and errors in judgment. Specifically:

  (i) Differentiate between a *stock's* market price and its intrinsic value, targeting undervalued stocks priced below their true worth.

  (ii) For *bonds*, the margin of safety lies in their yield or expected return. Make sure the yield is sufficiently higher than current interest rates to offset potential risks.

- *Diversification*: Spread your investments across a variety of assets and sectors. This reduces the risk of major losses from a downturn in any sector or industry.

- *Conduct rigorous analyses*: Use a mix of quantitative and qualitative evaluations (elaborated below) to make sure you don't overpay. At the same time, remember that you cannot truly predict the market.

KEY QUOTES

"It is easy for us to tell you not to speculate; the hard thing will be for you to follow this advice."

"Even the intelligent investor is likely to need considerable will power to keep from following the crowd."

Security Analysis Made Simple

Any investor must minimally understand a company's financial reports, including the balance sheet, income statement, and notes. Never buy/sell a security (a stock, bond, or derivative) without rigorous analysis.

When evaluating stocks, combine a range of financial metrics and qualitative factors to get a holistic view of a company's value and potential:

- *Valuation*: To avoid overpaying for growth, use this formula to gauge a growth stock's intrinsic value: Value = Current earnings × (8.5 + 2 x expected annual growth rate)
- *Price ratios*: The Price-to-Earnings (P/E) ratio should be below 15 and the Price-to-Book (P/B) ratio should be below 1.5. When multiplied together, P/E and P/B should not exceed 22.5.
- *Size and stability*: Prioritize companies with significant annual revenue and consistent dividend payments.
- Ensure the current *dividend rate* is sustainable.
- *Long-term prospects*: Assess the company's industry position and growth potential.
- Evaluate the *management* competence and integrity.
- *Financial strength*: Ensure the assets are greater than liabilities, with moderate debt levels.
- *Earnings per share (EPS)* is a key metric for evaluating a company's financial health and its stock's potential value.
  (i) Consider the *average earnings over time* for ideally 7-10 years. Prioritize companies with consistent earnings growth and avoid those with sporadic spikes.
  (ii) Dive deep to examine the *factors influencing EPS*. Separate factors that truly reflect the company's intrinsic value from other factors (like accounting methods/adjustments, extraordinary events, or stock splits/dividends).

Bonds are typically less risky than stocks, but they still require scrutiny. When evaluating bonds, look for:

KEY QUOTES

"The security analyst develops and applies standards of safety by which we can conclude whether a given bond or preferred stock may be termed sound enough to justify purchase for investment."

- A strong *equity-to-debt ratio* of ideally 2:1 or more.
- A strong record of *past earnings* to cover interest charges, ideally by at least 7x.

The 2 Investment Pathways

There are 2 types of investors or investment pathways:

- *Defensive (passive) investors* seek to avoid big mistakes and losses, and to earn decent returns with minimal effort.
- *Enterprising (aggressive) investors* are willing to take more risk and put in much more time/effort to achieve higher returns. This approach brings potential for higher returns, but also higher risks.

As an investor, your returns should match the amount of effort and risks you're willing to take. Thus, the defensive investor will typically earn a lower return compared to the enterprising investor.

Defensive Investing: Strategies and Asset Selection

For defensive investors, the ideal strategy is to go for a balanced portfolio with a blend of stocks and bonds.

- *Asset allocation*: Balance between high-grade bonds and high-grade stocks, ideally with a 50-50 split. This ratio can be adjusted between 25-75% in either direction, based on your financial needs and risk tolerance.

When selecting common stocks, apply strict criteria to select only large, reputable companies that are financially robust and have a history of growth.

- *Size*: Choose big companies with ≥$100mil in annual sales (for industrial firms) or ≥$50mil in total assets (for public utilities). They should in the top 25-30% within their industries.
- *Financial stability*: The current ratio (current assets to current liabilities) should be at least 2:1 for industrial companies

KEY QUOTES

"The rate of return sought should be dependent...on the amount of intelligent effort the investor is willing and able to bring to bear on his task."

and at least 30% for public utilities. Long-term debt must not exceed net current assets.

- *Dividend record*: Choose companies that paid dividends consistently for the past 20 years.
- *Diversify* your stocks between 10-30 different industries.
- *Stock price limits*: Pay no more than 15x the average earnings for the past 3 years.
- *Stable earnings*: Ensure positive earnings in the last 10 years.
- Ensure *growth in per-share earnings* of ≥30% for the past 10 years, using 3-year averages at the beginning and end.
- *Asset value*: Ensure the P/B ratio is below 1.5, and P/E multiplied by P/B is below 22.5.

Bonds provide stability to your portfolio by offering steady income and principal preservation.

- *Tax considerations*: Choose between taxable and tax-free bonds by comparing after-tax yields for your tax bracket.
- *Maturity*: Diversify between short-term and long-term bonds to balance between returns and stability.

While there are other investment instruments like preferred stocks, mortgage securities, and annuities, they may not be necessary in a defensive investment portfolio. Only include them if they specifically meet your financial needs.

Other best practices for defensive investing include:

- *Rebalancing*: Regularly adjust your portfolio to achieve your desired asset allocation. For instance, if your target stock-to-bond mix is 70:30, but market shifts change this to 75:25, you should sell some stocks and buy bonds to regain your target balance.
- *Avoid frequent or drastic changes* to your portfolio mix. Only adjust your asset allocation due to changes in financial needs (e.g. starting a family), not short-term market forecasts.
- *Dollar-cost averaging*: Invest a consistent amount at regular intervals—regardless of market conditions—to reduce the average cost per share over time.

KEY QUOTES

"This matter of choosing the "best" stocks is...a highly controversial one. Our advice to the defensive investor is that he let it alone. Let him emphasize diversification more than individual selection."

"This matter of choosing the "best" stocks is...a highly controversial one. Our advice to the defensive investor is that he let it alone. Let him emphasize diversification more than individual selection."

- To *guard against inflation*, invest in assets (especially stocks) that have historically performed well during inflationary times.

Enterprising Investing: Strategies and Asset Selection

The principles for defensive investing are also applicable to enterprising investing: to balance high-grade bonds and stocks, purchased at reasonable prices. However, enterprising investors tend to push the boundaries to explore more varied and potentially riskier assets that they believe can outpace the market.

- To succeed, they must put in significant time and effort to research, analyze and manage their investments. They must become *at least as knowledgeable as institutional investors*.

When selecting common stocks, they should consider:

- *Timing*: Understand market cycles to buy low and sell high.
- Choose *growth stocks* with consistent earnings growth, a competitive edge, and sectors with good growth potential. Assess the P/E ratios relative to their growth rates.
- Look for *bargain issues* or undervalued stocks priced at two-thirds or less of the company's net current asset value, for a good margin of safety.
- Capitalize on *special events* like restructuring, mergers, or spinoffs. But, make sure you have an in-depth understanding and precise timing.

Apply due diligence for other investment opportunities:

- *Second-grade bonds or preferred stocks* can offer high yields, but require a thorough risk assessment.
- For *foreign government bonds*, choose stable countries to mitigate political and currency risks.
- *New issues or common-stock offerings* tend to be overpriced, so always scrutinize the company's fundamentals and pricing.

KEY QUOTES

"The aggressive investor must have a considerable knowledge of security values—enough, in fact, to warrant viewing his security operations as equivalent to a business enterprise."

"Experience clearly shows that it is unwise to buy a bond or a preferred which lacks adequate safety merely because the yield is attractive."

Remember: active management doesn't guarantee better results.

- Avoid *pitfalls* such as: overdiversification, impulse-buying, and over-leveraging. Never risk your principal for marginal gains.
- Adopt *best practices* including:

  (i) Staying informed on market trends and investment methods.

  (ii) Reviewing and adjusting your portfolio regularly.

  (iii) Sticking to data-driven analysis with patience and emotional discipline, instead of following market sentiments.

  (iv) Diversifying your portfolio, while taking calculated risks with a limited portion of your assets.

Other Investment Insights

Investment (Mutual) Funds

Investment funds, commonly known as mutual funds, pool money from many investors to buy into a diversified securities portfolio. They offer a way for investors to diversify without the need to select individual stocks or bonds.

- Mutual funds have delivered *mixed results* compared to benchmark indexes like the S&P 500. Some funds out-performed the market consistently, while many performed below market averages, especially after accounting for fees and expenses.

There are various types of funds, such as balanced vs all-stock funds, open-end vs closed-end funds, load vs no-load funds. When selecting mutual funds, consider the fund objectives, fee structure, past performance relative to benchmarks, and your own financial objectives and risk appetite. Remember: professionally-managed funds with higher fees do not guarantee superior returns.

KEY QUOTES

"An elementary requirement for the intelligent investor is an ability to resist the blandishments of salesmen offering new common-stock issues during bull markets."

Convertible Issues and Warrants

Convertible issues and warrants can enhance returns, but they also introduce other risks.

- *Convertible securities* are typically bonds or preferred stock that can be converted into a predetermined number of the issuing company's common shares.
- *Warrants* give the holder the option to buy the company's stock at a specific price within a certain timeframe.

Make sure you analyze them carefully against your risk tolerance and strategy. Here are some factors to consider:

- Convertibles combine bond or preferred stock features with common stock, offering *potential capital appreciation* if the stock performs well. The bond's interest or dividend payments also offer some *downside protection* if the stock doesn't do well.
- It's *more complex* to value convertible securities and warrants, since you must consider both the fixed-income component and the conversion option.
- When these instruments are exercised, they may *decrease earnings per share and stock value* for existing shareholders.
- *Warrants can be speculative*, since they're often issued as a sweetener to attract investors for a bond/stock offering.

Graham's advice for investors:

- *Focus on the fundamental quality* of the bond or preferred stock, and only go for undervalued convertible securities or warrants. Don't get blinded by the "upside potential."
- *Scrutinize new convertible issues* carefully. Ask yourself: would a truly strong business need to attract investors using convertible features?

KEY QUOTES

"In exchange for the conversion privilege the investor usually gives up something important in quality or yield, or both."

"Our general attitude toward new convertible issues is...a mistrustful one...If a new issue is a really strong one, it is not likely to have a good conversion privilege."

Engaging Professional Investment Advice

Professional investment advice comes in many forms, such as commercial bankers, brokerage/investment firms, financial services, and specialized investment advisers.

- *Brokers, financial planners, and portfolio managers* provide personalized advice, specialized insights, and access to resources that individual investors may not possess.
- *Other financial services* offer tools and platforms to support investment decisions, such as research reports, in-depth stock analyses, and forecasts.

Consider these factors when using professional investment advice:

- *Be circumspect*. Despite their expertise, professionals are still subject to market uncertainties. Always validate expert inputs with your own research.
- *Consider cost implications*. Understand how adviser fees—be it fixed, hourly, or assets under management (AUM)—affect overall returns. Assess if the costs are justified by potential/actual gains.
- Some advisers receive commissions for specific product recommendations, leading to possible *conflicts of interest*. Always consider the motives behind the advice. Work only with competent, transparent advisers with a strong track record.

Ultimately, investors must educate themselves on investment basics and strategies, and take responsibility for their investment choices.

- *Defensive investors* may not be able to assess every piece of advice, but they can provide firm, specific instructions about their desired asset mix based on the earlier guidelines.
- *Enterprising investors* should work closely with their advisers, while cross-referencing advice across various reliable sources.

KEY QUOTES

"Any approach to moneymaking in the stock market which can be easily described and followed by a lot of people is by its terms too simple and too easy to last."

"The intelligent investor will not do his buying and selling solely on the basis of recommendations received from a financial service."

"If the reason people invest is to make money, then in seeking advice they are asking others to tell them how to make money. That idea has some element of naïveté."

Shareholder-Management Relations and Dividend Policy

Dividend policies can affect perceived shareholder value. The question is: should profits be reinvested for future business growth or distributed to shareholders as dividends? Typically, companies need higher retained earnings during periods of rapid growth, and during market downturns (when they need to conserve cash).

- The market generally favors companies that *consistently generate growth* from reinvested profits. Such companies can maintain robust stock prices despite low/no dividends. On the other hand, "income issue" stocks tend to find their market value intertwined with their dividend payouts.

Graham believed that shareholders are entitled to a company's earnings, and should demand transparency and accountability from management.

- If a company retains more than one-third of its earnings, it should demonstrate that the retained earnings are being translated to *future shareholder value*, e.g. growth in per-share earnings.
- He urged shareholders to *take active action* if a company is underperforming relative to its peers, or if market prices are persistently low (which could lead to the company becoming acquired).

Comparative Analysis in Practice

In the book, Graham compared 4 real companies to illustrate how security analysis can be used to assess companies' intrinsic values and potential risks. For simplicity, we'll use a set of fictional numbers to show how to compare companies in practice.

Metric	Company A	Company B	Company C	Company D
P/E Ratio	15	20	10	18
Debt/Equity Ratio	0.5	1.5	0.3	0.7
10-Year Avg. Growth	5%	3%	7%	2%
Dividend Yield	4%	2%	5%	3%
Historical Stock Price Stability	Stable	Volatile	Stable	Volatile
Business vs Stock Performance	Aligned	Divergent	Aligned	Divergent

KEY QUOTES

"Poor managements produce poor market prices."

"It is our belief that shareholders should demand of their managements either a normal payout of earnings...or else a clear-cut demonstration that the reinvested profits have produced a satisfactory increase in per-share earnings."

Here are some practical insights from the numbers:

- *Profitability and price*: All else being equal, the P/E ratios suggest that Company C may be the most undervalued.
- *Financial risk*: Company B's high debt/equity ratio indicates greater financial risk.
- *Growth prospects*: Company C has the highest average growth over 10 years, suggesting a strong future potential.
- *Historical stability*: Using stock price history as a signal of the companies' volatility, Companies A and C seem more stable.
- *Dividend analysis*: Using dividend yield as a gauge of profitability and shareholders returns, Company C seems to be a front-runner.
- *Business vs stock performance*: A stock may be overvalued or undervalued if there's a gap between stock price movements and business growth. Companies A and C's prices are aligned with their growth.

Compare all the metrics above to make a holistic decision. In this simple example, Company C seems the most promising.

- Often, analysts recommend stocks based on *transient factors* like "strong market action" or "recent earnings growth". Such considerations should be irrelevant to the intelligent investor.
- While numbers are a good starting point, you should always *look beyond quantitative metrics* to truly understand a company, its industry, competitive landscape, and future prospects.
- Don't make decisions based solely on past *trends or current momentum*. Make sure you understand a company's current competitive position, financial health, and growth prospects. Occasionally review the fundamentals of the companies you've invested in, to make sure they're still sound.

Other Details in the Book to Look Out For

The book included detailed explanations of different investment instruments. It also analyzed historical numbers and data for various asset classes and types of companies across different

KEY QUOTES

"Obvious prospects for physical growth in a business do not translate into obvious profits for investors."

"Obvious prospects for physical growth in a business do not translate into obvious profits for investors."

"The investor need not watch his companies' performance like a hawk; but he should give it a good, hard look from time to time."

industries. Besides the comparative analysis, Graham also presented 4 other case studies to illustrate market volatility and investment pitfalls. In addition, he compared 8 pairs of companies to reinforce the key factors that differentiate successful investments from less successful ones.

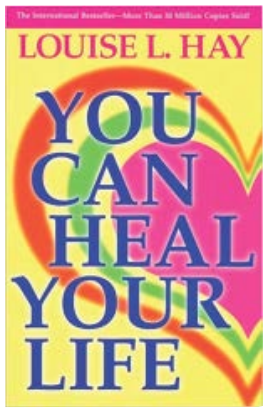
In each of the 20 chapters, financial journalist Jason Zweig also added his commentary to link Graham's timeless principles to the current financial landscape. This included: updated statistics to show how Graham's principles have held up over time, and modern examples to clarify or elaborate on how Graham's principles may be applied in today's markets.

About the Author

Benjamin Graham (1894–1976) was widely regarded as the father of value investing. Graham graduated from Columbia University and took a job as a chalker at Wall Street. He went on to do financial research for his firm and was made a full partner. At age 25, he was earning >$500,000 a year, but lost all this wealth in the 1929 market crash.

In 1934, Graham coauthored *Security Analysis* with David Dodd, which popularized the concept of intrinsic value. Later, he published *The Intelligent Investor* to capture his insights on investing. Graham also taught at Columbia University for 30 years, with Warren Buffett being one of his better known students.

KEY QUOTES



YOU CAN HEAL YOUR LIFE

by Louise L. Hay

The Big "So What"

First published in 1984, this was one of the pioneers in self-help books, and many of Hay's ideas have since been used and expanded upon by self-help gurus and holistic healers. It provides insights into the relationship between mind and body, and shows how limiting thoughts, beliefs and negative emotions affect us and are linked to our physical diseases. The book has sold over 30 million copies and helped millions with Hay's self-healing strategies and guides.

KEY QUOTES

"If we are willing to do the mental work, almost anything can be healed."

"If you will do the exercises progressively as they appear in the book, by the time you have finished, you will have begun to change your life."

Introduction

Hay wrote this book in the same way she takes a client through a private session or a workshop. Each chapter starts with an affirmation and includes one or more exercises or treatments. This summary covers her key philosophies, ideas and approach, including an overview of the recommended exercises. To apply the strategies, you will need to review the book in detail and apply the detailed instructions provided by Hay.

Hay's Beliefs And Philosophies

Here are some of Hay's key beliefs and philosophies that form the foundations of the book and her self-healing approach:

- "What we give out, we get back…Every thought we think is creating our future…"We are each responsible for all of our experiences."
- "The point of power is always in the present moment."
- "Everyone suffers from self-hatred and guilt…The bottom line for everyone is 'I'm not good enough'."
- "The only thing we are ever dealing with is a thought, and a thought can be changed."
- "We create every so-called illness in our body…Releasing resentment will dissolve even cancer."
- "Resentment, criticism, and guilt are the most damaging patterns."
- "We can change our attitude towards the past…To release the past, we must be willing to forgive."
- "We must be willing to begin to learn to love ourselves… When we really love ourselves, everything in our life works."
- "Self-approval and self-acceptance in the now are the keys to positive changes."

KEY QUOTES

The Source Of Your Problems

After working with so many clients, Hay found that the problems they are dealing with (body, relationships, finances, life in general) are rarely the real problem.

What is the problem?

The true problem almost always boils down to the fundamental belief that "I'm not good enough", and the lack of self love.

For example, the underlying belief of financial disaster is often "I'm not worthy of having money", that of having no friends is usually "nobody loves me" and the tendency to always try to please others often comes from the belief "I never get my way".

Where does it come from?

These beliefs, along with many other ideas of who we are and the rules we must live by, are often learned when we are very young, from the adults around us. When we grow up, we tend to re-create our lives around these beliefs. Hay recommends several exercises, such as shifting "I should" to "I could" to realize we have a choice, identifying underlying issues beneath the visible problems, and identifying where some of our limiting beliefs come from.

As we become aware of underlying issues and their sources, we must be conscious not to lay the blame on our parents or others. Hay believes that we chose our parents to helps us learn what we need to learn. We alone are responsible for how our life unfolds. Blaming others only means giving our power away.

KEY QUOTES

"Whatever we send out mentally or verbally will come back to us in like form."

"Blame is one of the surest ways to stay in a problem. In blaming another, we give away our power. Understanding enables us to rise above the issue and take control of our future."

Essentially, we are dealing with thought patterns. Once we recognize this, we realize we have the power to begin change right now, at this present moment. Since it all begins in the mind, we also have full and complete control of the outcomes in our lives.

Are Our Beliefs Even True?

Our beliefs (e.g. “boys don’t cry”, “you are not good at this”) become our reality, hence we should examine if they are true to begin with. Even if they were true in the past (e.g. don’t trust strangers as a child), they may no longer be true today. Learning to let go of false or old beliefs is a key to changing our lives.

How To Change

We start with a willingness to change, and by overcoming our natural resistance to change. Next, we learn to control our minds and thoughts, and to forgive ourselves and others.

1. Nurture the willingness to change

We must be willing to change on the inside before our outer circumstances will change. The process of healing begins the moment we begin to think about making a change. Hay details a “willing to change” exercise to identify the source of your resistance to change and use affirmations to release the resistance.

KEY QUOTES

“If a thought or belief does not serve you, let it go! There is no written law that says that because you once believed something you have to continue to believe it forever.”

“When the child within feels unsafe, it creates a lot of trouble… Be kind to yourself. Begin to love and approve of yourself. That’s what that little child needs in order to express itself at its highest potential.”

Reshaping our beliefs is like doing a mental housecleaning. We must remove old things to put in the new. Go through each of our mental rooms and examine the thoughts and beliefs, to decide which ones to keep and polish, and which ones to throw out. To change the deeply-buried patterns, we must first be aware of them. Here are some forms of resistance to look out for:

Nonverbal cues e.g. changing the subject, falling sick, looking away, doing something else.

Assumptions e.g. "you wouldn't' understand", "that won't make a difference", "my situation is different".

Beliefs e.g. "It's not right to do this", "that's too expensive", "I'm not that kind of person".

Them e.g. "God won't approve of it", "they won't let me", "my doctor doesn't allow it", "it's against my upbringing/ religion".

Self-Concepts e.g. I'm too old, young, weak, strong etc.

Delay Tactics e.g. "I'll do it later", "now is not the right time".

Denial e.g. "it will go away", "there's nothing wrong".

Fear e.g. "I might fail", "what would others think?".

Look out for these signs of resistance so you can release them (and push ahead with the changes anyway). The crux is not about willpower or discipline; it is about the willingness to let go of the old/ past. Note that repeating patterns highlight a need in us that must be addressed. Self-worth and kindness to yourself support change, while criticism of self and others don't.

KEY QUOTES

Rather than work on ourselves, it is often easier to focus on what others need to change. "Leave our friends alone", Hay says. People will change when they are ready; meantime, we can only focus on our own change.

2. Control the mind

Your mind is a tool that you can use in any way you want. You are in control of your mind, not vice versa. By controlling the mind, you can shape your thoughts and beliefs for the future.

Understand that the past is over and done; it cannot be changed and need not hold us back. Physical release can also help to unlock pent-up emotions and past experiences. For example, screaming with your windows closed or beating the pillows are both harmless ways to release pent-up anger.

3. Forgive yourself and others

Many people allow the past to hold them back; they cannot enjoy the present and future because of something that happened in the past. The way to release the past is to forgive ourselves and others.

Hay details several exercises to help us let go and release old patterns that have resulted in our current conditions or problems, and to forgive ourselves and others.

Building The New

Creating positive change is like planting seeds. It takes time for the seeds to sprout, and we need to constantly nurture the seedlings and keep the weeds away.

KEY QUOTES

"The way you now use your mind is only a habit, and habits, any habits, can be changed if we want to do so, or even if we only know it is possible to do so."

"Love is always the answer to healing of any sort. And the pathway to love is forgiveness. Forgiveness dissolves resentment."

"The more you dwell on what you don't want, the more of it you create."

Build on the Positives

What you place your attention on will grow. Hence, move away from negatives e.g. “I don’t want to be fat”, “I don’t want to be unhappy”; instead, focus on what you do be or have e.g. “I am healthy and slender”, “I am happy, joyous and free”. Learn to think in positive affirmations as a habit, using the present tense e.g. “I am”, “I have”.

As you start to observe your inner thoughts, you may notice negative thoughts - catch them in mid-sentence, rephrase them, drop them or tell the thoughts to “get out”.

Self-approval and self-acceptance are crucial for positive change:

Start with small things about yourself that you consider to be good qualities. Over time, you will lean to love and approve all of yourself, including qualities that you felt were not “good enough”.

Release ourselves from other people’s opinions: Each of us are unique, hence there is no need for competition nor comparison.

Put it to practice: Think and do things that make you and your body feel good (e.g. be with the right people, eat the right foods, think the right thoughts).

Hay provides several exercises in the book, including affirmations for self-approval, identifying negatives to be changed to positives, and developing positive beliefs that you deserve good things in life.

KEY QUOTES

“No matter what the problem, the main issue to work on is loving the self: this is the “magic wand” that dissolves problems.”

Holistic Philosophy

Hay advocates a holistic approach to nurture and nourish your entire being. This includes your Body (through nutrition, exercise etc.), your Mind (through visualization, affirmations, workshops etc.) and your Spirit (through prayer, meditation, practicing forgiveness and unconditional love etc.). Apply as many of these practices as possible, every day.

Daily Work

Changing your life is a gradual process that takes daily effort, and you will stumble along the way. Hay recommends several tips for progressively building up the momentum for change, e.g. beginning your day on a positive note, giving a few minutes daily to quiet meditation, doing daily affirmations etc. She also recommends several exercises to improve self-love, visualize the new you, and expand your knowledge.

Treat the process like how a child learns to walk - just keep going, judging your "failures"; Add on progressively and remind yourself frequently that you are doing the best you can.

Putting the Ideas to Work

For each of these areas, Hay recommends how we can apply the ideas above, including affirmations and exercises that can be used:

Relationships:
We attract the people in our lives; they are a mirror of our qualities or beliefs about relationships. If there's something you dislike about someone, start by asking how you are like that, and when do you do similar things. When you remove your own patterns

KEY QUOTES

"Relationships are mirrors of ourselves. What we attract always mirrors either qualities we have or beliefs we have about relationships."

"Love is never outside ourselves; love is within us."

and habits, that other person will either change, or he/ she will leave your life. Likewise, with love, don't hunt for it; When we love ourselves and are loving and receptive to love, we will attract people who have similar qualities.

Work:
You are in your work situation because of your own thinking patterns. Identify the areas of work you wish to improve (e.g. salary, colleagues), bless it, and affirm what you wish to create.

Success:
When something doesn't turn out the way you envisage it, it does not mean it is a "failure"; it merely provides the learning experience you need. Hay provides a series of success affirmations to help us plant the "seeds of success".

Prosperity:
Prosperity starts with our inner state of mind. We need to examine our beliefs about money, our beliefs about whether we "deserve" to prosper, and be willing to clear out the old to make room for the new. Love and bless your bills (don't dread them) as an acknowledgement of your ability to pay.

KEY QUOTES

"The law of experience is always perfect."

"True prosperity… is never an amount of money; it is a state of mind."

The Body

How we think and speak leads to our bodies' "eases" and "dis-eases". We create every dis-ease in our body due to our own thought patterns. Hay explains how some of these conditions come about, and how to listen to what our body is telling us through its dis-eases and discomforts, including headaches, baldness, sore throats, arthritis, back problems, heart attacks, cancer, ulcers etc.
The book includes an additional 60 pages of detailed Probable Mental Patterns (from Hay's book Heal Your Body) that cause

"The body, like everything else in life, is a mirror of our inner thoughts and beliefs…Every cell within the body responds to every single thought you think and every word you speak."

illnesses and suggested affirmations or thought patterns that can be used to create health instead. Essentially, patterns of thought relating to resentment, criticism, guilt and fear are the main contributors to our so-called illnesses. Forgiveness and releasing these thought patterns (alongside healthy nutrition and care for our body) are the key to wellness.

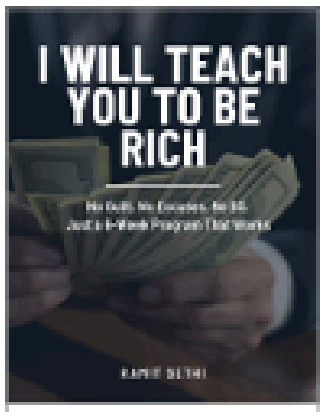
Additional Notes from Summary Author

This book may not be for everyone, as it is strongly anchored in New Age concepts and alternative healing methods. But for those who are open to such concepts, the book provides a detailed, step-by-step guide to start uncovering personal limiting beliefs and negative thoughts, and to start making positive changes.

It was not possible to capture all the suggested affirmations and exercises, nor the long list of illnesses and their likely corresponding "mental blocks". If Hay's ideas and concepts resonate with you, I suggest you pick up a copy of the book, as you will definitely refer to it many times in the course of applying these techniques. The book also includes a list of additional holistic healing resources, and you can get more updated resources on www.louisehay.com.

KEY QUOTES

'Your security is not your job, or your bank account, or your investments, or your spouse, or parents. Your security is your ability to connect with the cosmic power that creates all things."



I WILL TEACH YOU TO BE RICH

No Guilt. No Excuses. No BS.
Just a 6-Week Program That Works

RAMIT SETHI

The Big "So What"

Many young people are living from paycheck to paycheck, with no savings and no plans for their financial future. This book presents a 6-week program that'll help you to start managing your money better and live a more fulfilling life. The insights are especially useful for young people in their 20s and 30s in America, but can be applied by anyone who wants to be financially well-off.

Introduction

You don't need to be a financial expert to become rich. The best financial management principles are actually very simple: sound budgeting, conscious spending, sensible banking, and buy-and-hold investment strategies.

To get rich, start investing your money as early as possible. If you keep your money in the bank, you'll lose money due to inflation of about 2% per year. Don't wait till you're 100% sure to invest or you'll end up doing nothing. Take small consistent steps and learn along the way.

If you follow the practical steps in this book, you can start to take control of your money in 6 weeks, redirect it toward your financial goals and eventually achieve financial independence.

KEY QUOTES

"You don't have to be an expert to get rich. You do have to know how to cut through all the information and get started."

"Investment isn't about being sexy—it's about making money."

"The single most important factor to getting rich is getting started, not being the smartest person in the room."

1. Manage your Credit

Credit should be a financial resource, not a burden.

Use Credit Wisely

Debt or credit allows us to purchase high-value items that we can't otherwise afford, e.g. a house, car, university education. Generally, debt is good if you use it for things that increase in value over the loan duration (e.g. a house).

However, it can have serious consequences if you develop the habit of spending more than you earn.

- When you don't pay your monthly credit card payments in full, you incur average interest rates of 14% per year. The bank may also levy extra *penalties* for missing your payments.

  (i) If you spend $10,000 on a credit card purchase and only pay the minimum monthly balance, it'll take you 13yrs to repay the amount. The *interest* alone is ≈ $4,000, since the debt rolls over each month and the interest builds up. You end up paying much more for your purchases.

  (ii) There's also an *opportunity cost*. If the $4,000 had been invested at 8% returns, you'd have $27,000 after 13yrs.

- However, if you use your credit cards responsibly and *pay your bills in full* every month, your cards can serve as an interest-free loan, help you to track your spending, and even earn cash bonuses, air-miles and other perks.

Improve your Credit Rating

Your credit rating reflects your borrowing track record. It comprises (i) a *credit record* of your personal information and borrowing habits, and (ii) your *credit score* which shows

KEY QUOTES

"Establishing good credit is the first step in building an infrastructure for getting rich."

how likely you are to repay your loan. The better your credit score, the less risky you are to lenders, and the easier and cheaper it is to get a loan. A good credit score can save you thousands of dollars over your lifetime.

Build a good credit track record by optimizing a few credit cards.

- As a rule of thumb, use just 2-3 credit cards with the *lowest fees and the best rewards*. Do your research: choose a card with a low interest rates and suits your lifestyle, e.g. if you travel a lot, opt for a card which gives air miles.

- Your *credit utilization rate (CUR)* is your current debt divided by how much you can borrow. The lower your CUR, the better. To improve your CUR, call your bank to increase your credit allowance or pay off your credit card debt.

- Minimize your *card-related charges*. Call your bank to negotiate the fees, payback periods, interest rates and credit limits. It's much easier to get concessions when you've been using the same card for several years.

Start repaying your debts to reduce your interest payments and improve your credit rating.

- Work out how much debt you have, then *develop a monthly plan* to repay it. Deduct each month's expenses from your income to calculate how much you can set aside. If you can't even cover your minimum payments, you must earn more, spend less and negotiate for a lower minimum balance.

- If you have >1 credit card, start by paying the minimum on every card. Then, pay as much as you can, either for the card with the highest interest or the lowest balance. Freeze all new spending on the cards, and aim to *pay off 1 card at a time*. Automate your monthly repayments so you won't forget to pay them nor feel the loss psychologically.

Action Steps for Week 1

- Get your credit report and credit score.
- Research and manage your credit cards (aim for zero fees).
- Develop a plan and up automatic paymentsto pay off existing debts.

KEY QUOTES

"Optimize your credit card(s) and use them as a spearhead to improve your overall credit."

"You can't make a plan to pay off your debt until you know exactly how much you owe."

"Paying off debt just takes hard work and a plan."

2. Optimize your Bank Accounts

Bank accounts are at the core of your personal finances. Pick the best banks/accounts, minimize fees and maximize interest.

Choose banks accounts that suit your needs, offer lower fees and higher interest rates.

- *Do your research*. Ask your friends for recommendations and compare different banks' interest rates and fees (e.g. overdraft charges, annual/monthly fees and ATM withdrawal fees).

- *Pay attention to the bank fees*. These are often more crucial than the interest rate. If you save $1,000, you'll earn $5 annual interest at 0.5% interest rate. Yet, an overdraft fee of $10 (for not having enough money in your account) will wipe out the entire year's interest in one go.

Don't be afraid to negotiate your bank fees and minimum limits. Banks earn money by lending the money deposited by customers (like yourself) to other customers. It can cost $200-$3,500 for a bank to acquire a new customer, so they'll want to retain your business.

- If you incur an overdraft fee, call up your bank to explain that it's a first-time mistake and ask them to waive it. Usually, you can also get other charges (e.g. annual fees, ATM fees) or minimum balances waived if your employer direct deposits your paycheck into the account each month.

Open separate checking and savings accounts to get the best rates and services from each account.

- *Checking accounts* are used for money that you spend regularly, e.g. paying your bills/expenses via checks, debit cards, ATMs or online transfers. Go for a *no-fee, no-minimum checking account* for such regular transactions.

- *Savings accounts* are for storing money that you won't need in the short/medium term. Set up a separate *high-yield savings account* to maximize your interest and to

KEY QUOTES

"Your bank's fees are often more important than the interest rate it offers."

to reduce the temptation to dip into your savings. Sethi recommends *online banks* since they can offer 6-10x higher interest rates than traditional brick-and-mortar banks. It may take 3-5 days to withdraw money from online accounts, but the higher interest rates are worth it since you won't be making regular withdrawals.

- You can even open several accounts with *multiple banks* to get the best rates and services from each.

Action Steps for Week 2

- Open or switch to a no-fee, no-minimum checking account.
- Open or switch to an online high-interest savings account.
- Leave 1.5 months' living expenses in your checking account as a buffer. Transfer the balance to your savings account each month.

3. Prepare to Invest

The earlier you invest, the faster you can get rich. Set up 2 types of retirement investment accounts—a 401(k) and a Roth IRA—so your money can start working for you 24x7.

Many companies offer the 401(k) account to their employees. You just need to fill out a form to indicate (i) how much of your paycheck should be sent directly to this account and (ii) the investment options you prefer. Let the money grow over time. You can start withdrawing when you're at least 59.5 years old.

- The 401(k) account offers *several benefits*:

  (i) Once it's set up, the money gets transferred *automatically* from your paycheck without you having to do anything.

  (ii) Your 401(k) contributions are *pre-tax*, i.e. you only pay tax when you withdraw the money. This means an extra 25-40% more money being invested and compounded to maximize your returns.

  (iii) Your employer may match the amount you contribute, up to a certain limit (e.g. 5% of your salary). This means *extra money* each month.

KEY QUOTES

"Compounding is mankind's greatest invention because it allows for the reliable, systematic accumulation of wealth."
—Albert Einstein

- *Tips for leveraging the 401(k)*:

  (i) Ask your company if they offer the 401(k). Open an account asap if you haven't.

  (ii) Maximize the employer's match: if your employer will match up to $5,000, then put in $5,000 p.a. or $416 p.m. to get the full company match. If possible, go beyond that to invest the maximum allowed for the 401(k).

  (iii) You can withdraw money from your 401(k) before you're 59.5 for certain emergencies, but avoid premature withdrawals since you'll pay taxes and a 10% penalty.

  (iv) If you change jobs, move your 401(k) money to an IRA account. Don't move your money into your new company's 401(k) since you won't get the employer's match on the older funds. Don't keep your money in your old 401(k) either, as you probably won't make the payments. The worst thing to do is to cash out your 401(k) and pay the penalties/taxes.

KEY QUOTES

Another retirement account to open is the **Roth IRA**. To qualify, your income must be within certain stipulated levels.

- The *key benefits* of the Roth IRA are:

  (i) You can invest in whatever you want; and

  (ii) You pay tax on your contributions but not on your earnings. In short, you invest your after-tax income, let the investments grow and needn't pay tax on the earnings when you withdraw the money in future.

- *Tips for your Roth IRA Account*:

  (i) Compare different options based on their minimum required investments and features offered.

  (ii) Consider discount brokerage firms (e.g. Vanguard or T. Rowe Price) since they offer lower fees and online access.

(iii) Open an account asap. You can withdraw from the account without penalty after 5 years. So, the earlier you open it, the earlier you can start withdrawing.

To get the best returns, invest in this sequence:

- *Open a 401(k) account*. If your company offers a match, contribute enough to get the full match. If not, don't make contributions yet.
- *Pay back your existing debts*, since the interest rates are usually much higher than what you can earn from investments.
- Set up automatic monthly deposits for your *Roth IRA account*. Contribute as much as possible.
- If there's money left, *max out your 401(k)*. Then, put the balance into a *non-retirement account*, pay off any mortgage debts and invest in yourself (e.g. start a business, further your studies).

KEY QUOTES

"If you invest in yourself, the potential return is limitless."

Action Steps for Week 3

- Open your 401(k) account.
- Come up with a plan to pay off debt.
- Open a Roth IRA with automatic monthly transfers

4. Adopt Conscious Spending

Use a conscious spending plan to become aware of how you're spending your money and consciously decide how you'll allocate your monthly take-home pay.

As a rule of thumb, set aside:

- 50-65% for *monthly fixed expenses* (e.g. rent, utilities, car insurance, debt repayments).
- 10% for *long term investments* (e.g. 401(k), Roth IRA and other investment accounts).

- 5-10% as *savings* for short-term goals (e.g. vacations, Christmas gifts), and long-term goals (e.g. a wedding or down-payment on a house). For example, if you aim to save $28,000 for a wedding in 6 years, you should start saving $389 a month (28,000/72 mths).

- 20-35% for *guilt-free discretionary spending*.

Reduce spending effectively with these tips:

- *Be frugal, not cheap*. Frugal people focus on long-term value and spend on what matters. Cheap people focus on the lowest price, try to pinch pennies in every area and may even scrounge off others. The key is to spend on what you truly love and ruthlessly cut the rest—if you love designer shoes, go ahead and buy them with the money for discretionary expenses but cut expenses in other areas.

- *Use the 80/20 rule*: Zoom in on the 20% cost items that make up 80% of your expenses. Focus on the big wins, e.g. reduce credit card interest instead of saving $1 on a chocolate bar.

- *Go "à la carte"*. Cancel all your recurring subscriptions, then pay for the items you need individually. We tend to overestimate how much we'll use a subscription service. If you pay as you go, you'll make a conscious decision each time you pay. For example, stop paying $70/month for a gym membership which you use only 3 times; buy a $10 day pass each time you go.

- *Set a savings goal*. It's easier to forgo an expensive lunch to save for a meaningful goal like a holiday or house down-payment.

- Don't take extreme measures (e.g. stop eating out altogether) as it's not sustainable. Instead, *set realistic goals*, e.g. progressively decrease meal expenses by $10 each week.

- Use the *envelope system* to pre-allocate a fixed monthly amount to each expense category, e.g. $250 for eating out, $350 for groceries. You can transfer money between envelopes, but you must stop spending once an envelope is empty.

KEY QUOTES

"Frugality, quite simply, is about choosing the things you love enough to spend extravagantly on—and then cutting costs mercilessly on the things you don't love."

"Try focusing on big wins that will make a large, measurable change."

Once you've implemented a Conscious Spending Plan, give yourself some time to settle into a new rhythm. **Maintain your spending plan**—if you have an unexpected bonus or pay raise, give yourself a small reward then save/invest the rest.

You can concurrently seek to **increase your income**:

- Deliver more value in your job so you can *negotiate a pay raise*. Track your work tasks and results, and ask your boss for feedback on how exactly you can exceed expectations. Adopt the feedback, track your results and get feedback again on how to do better. When you know you've been exceeding expectations and delivering real results, request for a meeting to discuss your compensation—ask your boss what you must bring to make the discussion more fruitful, and prepare accordingly.

- If you're in a dead-end job, consider getting a *higher-paying job*. Or, earn extra income from *freelance work*, e.g. babysitting, tutoring or dog-walking.

Action Steps for Week 4

- Using your paycheck and expenses last month, roughly estimate the numbers for your Conscious Spending Plan.
- Define your savings goals and monthly fixed costs. Go à la carte, break down the expenses, then recalculate your plan.
- Pick 1-2 big wins that can deliver the biggest expense cuts.
- Take 1 hour per week to enter your cash receipts, refine your percentages and maintain your plan.

5. Automate your Money Transfers

Invest some time to set up your money flow to run on autopilot. This prevents procrastination and saves you time in the long run. You'll just need 1-2 hours per month thereafter to review your bills and accounts.

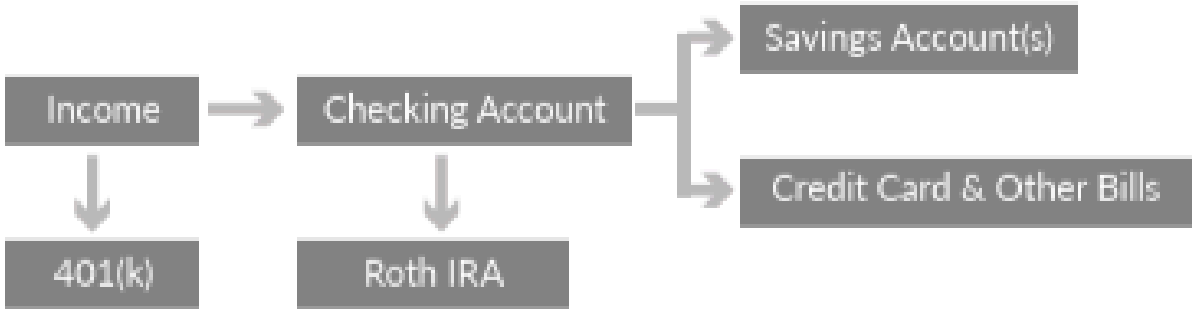
KEY QUOTES

"Make sure a raise goes to your bottom line, not to your head."

"Getting a raise is not about you. It's about you demonstrating your value to your employer."

"The key to taking action is, quite simply, making your decisions automatic."

Set up your money flow as follows:



- *Funnel all your money through your checking account*. Get your salary deposited into this account. Then, automate transfers from your checking account (i) into your savings and investment accounts according to your Conscious Spending Plan, and (ii) to pay off your credit cards and other bills.

- *Time your transfers*: include a few days' buffer between the expected in-flow vs out-flow of money.

- If possible, *use your credit card* to pay for everything. Keep your receipts and tally them against your statement weekly. Get your card company to email you the credit card statement for review before payment. Have the bank notify you if your card spending a crosses a certain limit (to avoid incurring overdraft fees).

If you don't earn a regular income (e.g. if you're a freelancer), get a solo 401(k) or a SEP IRA instead of the traditional 401(k). Before you start investing, set aside 3 months of minimum living expenses in your savings account as a buffer.

Action Steps for Week 5

- List down all your accounts. Link them as payees for online banking.
- Set up your automatic money flows using the tips above.

6. Know What to Invest In and How

Investment is *not* about picking "hot stocks" or trying to beat the market. The best investment strategies are actually very simple. Learn them and set aside an afternoon to set up your investments.

KEY QUOTES

"By spending a few hours up front, you'll end up saving huge amounts of time over the long term."

"Some of the best debt reduction strategies...involve tricking yourself into putting money aside, and making it hard to spend."

Why You Shouldn't Pay for Financial Expertise

A real expert should deliver concrete results. Yet, most financial "experts" don't deliver higher investment returns than laymen:

- Don't believe so-called experts who claim they can predict the market or pick winning stocks. Financial markets are so complex that *no one* can accurately *predict or outsmart them*.

- Analysts and experts may appear to have superior insights due to the *survivor bias*—we only notice their successes but not their failures. A financial company may start many mutual funds, wait to see which ones succeed, then aggressively market those funds without us seeing the other funds that've failed or closed down. Likewise, analysts blow their trumpets when their predictions are right but not when they're wrong (which happens very often).

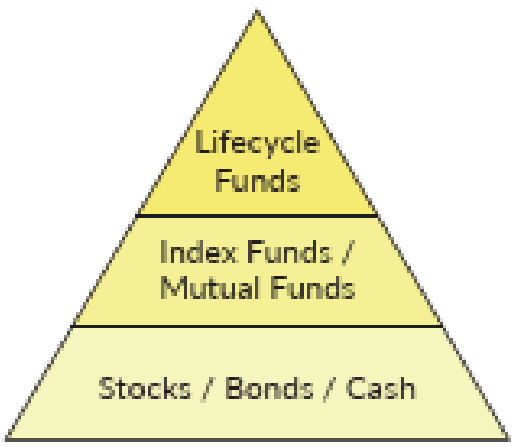
There are indeed a handful of experts who consistently beat the market, e.g. Warren Buffett, Peter Lynch and David Swensen. They've each delivered at least 2x higher returns than the market, with 16-22% annualized returns over a period of more than 10 years. However, they advocate long-term, low-cost investments with a diversified portfolio.

What to Invest in and How

There're several asset classes in investments:

- At the basic level, you have *stocks, bonds and cash*:

  (i) When you buy *stocks or equities*, you're buying a tiny part of a company. The stock value changes depending on the company's performance. Overall, stocks provide good returns (ave 8% p.a.) but it's hard to predict how individual stocks will perform.



KEY QUOTES

"Ultimately, expertise is about results."

"The only long-term solution is to invest regularly, putting as much money as possible into low-cost, diversified funds, even in an economic downturn."

(ii) When you buy *bonds*, you're lending money to a government or company, on the promise that they'll pay it back with interest upon the bond's maturity. You can choose the duration of the loan and know the exact returns you'll get. Generally, the longer and riskier the bonds, the higher the returns. Government bonds are the safest with lowest yields of 2-3%.

(iii) Your uninvested money is held as *cash* (usually in the bank). It's the safest but you'll lose money due to inflation.

- Stocks/bonds can be clustered into *mutual and index funds*.

  (i) *Mutual funds* are groups of stocks (and sometimes bonds) that're actively managed by fund managers. These managers are paid high salaries to pick the best funds, and investors are charged 1.5-3% of the invested amounts for this service. This means that to breakeven, the funds must perform at least 1.5-3% better than the market. Yet 75% of the time, fund managers fail to beat or even match the market. So, you end up paying higher fees for lower returns!

  (ii) *Index funds* use computers to run the fund. Instead of trying to pick "good" stocks, the computers include *all* the stocks in the index (e.g. all 500 stocks in the S&P 500) to match the market. Such funds move closely with the market, so there'll be short-term fluctuations but long-term growth (since markets almost always grow in long-term). Index funds charge lower fees (≈0.18%) compared to mutual funds (≈2%), which makes a huge difference over time. Assuming you invest $100/mth at 8% returns, you'll have $70k in an index fund but only $44k in a mutual fund after 25yrs.

- Your financial needs change with age. In your 20s/30s, you can afford to be more aggressive and invest mainly in stocks, since you can wait for the market to rebound if it hits a downturn. As you get older, you should balance your portfolio with bonds (which are safer but have lower yields). *Lifecycle funds* automatically diversify your investments based on your age. They're ideal for people who prefer a fuss-free, one-size-fits-all option that's low-cost and tax-efficient.

KEY QUOTES

"If you're not investing, in the long term you're losing money every day."

"Nobody can consistently guess which funds or stocks will outperform, or even match, the market over time."

"When it comes to investing, fees are a huge drag on your returns."

- There're also *other investment options* (e.g. real estate, art, precious metals), but the returns generally aren't that good.

The key to successful investment is to **build a diversified portfolio**. This involves (i) allocating your money across different asset categories (e.g. stocks vs bonds) and (ii) diversifying your investments within each asset category. That way, your portfolio is protected even if 1 market or sector suffers a dip.

- The easiest approach is to invest in *lifecycle funds*, which is diversified and automatically adjusted according to your age.

- If you prefer more control, then build and manage your own portfolio by *choosing your index funds* (which Sethi recommends over mutual funds). However, you must have the discipline to rebalance your portfolio every 12-18 months (see the next section).

  (i) Choose at least *3-7 different funds*. Many funds require a minimum investment of $1-3k, so you'll probably need to build your portfolio gradually as you save up. Start with equities for faster growth, then add bonds to balance your portfolio. Choose funds with low management fees (<0.75%) and a strong performance over the past 10-15 years.

  (ii) You can start with *David Swensen's recommended allocation*: 30% domestic funds, 15% developed world international equities, 5% emerging world equities, 20% real estate funds (REITS), 15% government bonds and 15% treasury inflation protected securities (TIPS). This can be adjusted later based on your age and risk tolerance.

No matter which option you choose, go for **automatic investing**.

- Set up automatic monthly payments so you needn't monitor the market closely nor be tempted to make irrational changes. By investing small amounts over time, you're also diversifying your risks using *dollar-cost averaging*. When prices go up, you'll automatically

KEY QUOTES

"When you're evaluating a fund, the only way to really gauge it is by looking at its track record for the last ten years or more."

"Automatic Investing may not seem as sexy as trading in hedge funds and biotech stocks, but it works a lot better."

buy fewer shares; when prices go down, you'll automatically buy more. In the long run, this offers more predictable returns than trying to beat the market with short-term speculation.

- Adopt a *long-term perspective*. Don't panic and sell your investments when the market dips. Smart investors know that markets *will* recover—they hold their investments and sell only at the right time/price.

- There's no need to pay for financial expertise since you can get higher returns from automatic investments in low-cost funds. But if you still wish to hire a *financial adviser*, then (i) choose a fee-based (not comms-based) adviser, (ii) do reference checks with their clients (with a similar profile as you), and (iii) ask for their approach (including what they'd do in the next 30, 60, 90 days). Or, if you still wish to explore *mutual funds*, look for those that consistently outperform the market by examining their post-fee, post-tax returns for the last 10, 15 and 20 years.

The earlier you start investing, the better. Use several hours to set up your investments properly and start growing your money.

Action Steps for Week 6

- Choose lifecycle or index funds based on your investing style.
- Research your investments and decide on your portfolio mix.
- Buy your fund(s).

7. Maintaining your Investments

By now, 85% of the work is already done, though you must still rebalance your funds every 12-18 months if you chose index funds. Some funds will out-perform others, resulting in a change in your portfolio mix over time. You may start with 30% domestic equities, yet 12 months later they can make up 50% of your portfolio if they increased more in value compared to other funds. To maintain your target asset allocation, (i) pause your automatic payments for the high-performing funds and (ii) redistribute the money among the other funds.

KEY QUOTES

"Be fearful when others are greedy and greedy when others are fearful."

"Being rich is within your control, not some expert's. How rich you are depends on the amount you're able to save and on your investment plan."

"Because compounding works so effectively, the more you save now, the more you'll have later."

Aim to reach the target percentages in your Conscious Spending Plan asap. Thereafter, save and invest as much as possible so you can get the most of the compounding effect. Once you reach your investment goals, go ahead to cash and enjoy the rewards.

Living a Rich Life

Having a rich life goes beyond acquiring money, though money can give us the freedom to do what we love and give back to others. By having a conscious spending plan and a system to save and invest automatically, you can spend on things that matter and still achieve your goals.

In the book, Sethi discusses many financial decisions that'll impact your life and financial stability. In particular, your big purchases (e.g. buying a car or house) have a disproportionate impact compared to your small saving on clothes or meals.

- Consider the *total cost of ownership* (e.g. insurance, property tax, repairs and maintenance of owning a house), the upfront vs monthly payments, and the opportunity cost (money that could've been invested or used for other priorities).

- Do your research carefully and *make financially-sound decisions*. Buy a car/house that you'll drive or live in for ≥10 years to maximize the lifetime value.

Money matters can affect your relationships, yet it's awkward to talk about money. In the book, Sethi also addresses how to handle sensitive conversations about money with your parents, spouse or friends.

Other Details in the Book to Look out For

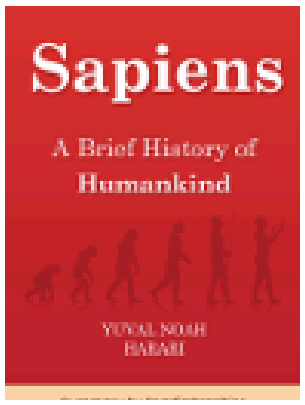
This is a light and humorous book with many illustrations, calculations, recommended resources and detailed steps/ tips to guide you through the 6 weeks' action plan and beyond.

KEY QUOTES

"A rich life is about more than money. It starts by managing your own. And it continues by helping others become rich."

"Focus on spending time on the things that matter, the big wins."

"Getting rich isn't about one silver bullet or secret strategy. It happens through regular, boring, disciplined action."



SAPIENS

A Brief History of HumanKind

YUVAL NOAH HARARI

The Big "So What"

We tend to think of mankind as the unique and inevitable masters of this Universe. In reality, we were not the only human species that existed on Earth, and most of our progress happened only in the recent past. Through a detailed account of human history, Harari presents the facts and myths of how mankind has dominated the planet, the driving forces shaping our lives and how we can think about our impact on Earth.

Introduction

All humans alive today are *Homo sapiens*; we're part of the *Homo* genus (in the same family as chimpanzees, gorillas and orang-utans) and we're of the species *Sapiens* (which means "wise"). Sapiens have only existed for an extremely short duration of Earth's history:

- About 13.5 billion years ago, the Big Bang brought matter, energy, time and space into this Universe. Around 300,000 years later, matter and energy fused into atoms, which then combined into molecules.

- About 3.8 billion years ago, some molecules combined to form organisms on Earth.

    - Around 6 million years ago, *human/ape-like traits* emerged, and the first *Homos* appeared in Africa 2.5 million years ago. Around 100,000 years ago, there were at least 6 *Homo species* co-habiting Earth, including the *Homo erectus* and *Homo neanderthalensis*. They looked like us (especially the Neanderthals), with big brains and moved on 2 legs.

KEY QUOTES

"Just 6 million years ago, a single female ape had two daughters. One became the ancestor of all chimpanzees, the other is our own grandmother."

- The *first Homo sapiens* appeared in East Africa about 200,000 years ago, but only started to spread outside Africa 130,000 years later. This was the start of human history, which Harari classified into *3 key revolutions*: the *Cognitive Revolution* (70,000 years ago), the *Agricultural Revolution* (12,000 years ago) and the *Scientific Revolution* (500 years ago).

The Cognitive Revolution

Homos started out like other animals, foraging for plants, small insects/animals, carrion from carnivores, and occasionally hunting larger game. *Homo sapiens* were able to move to the top of the food chain mainly due to the evolution of our language.

Language and Imagination

The main factor that set *Homo sapiens* apart from other *Homo* species was probably our unique language capabilities:

- It's *extremely flexible* and can be combined in infinite ways to deliver complex nuances and rich information about our world.

- We use it more extensively than other animals to gossip and *shape our social structures and relationships*.

- Most importantly, we can *imagine and communicate about things that don't exist*. An ape may be able to communicate to another ape that there's a lion by the river, but only a Sapien can imagine and convey that the lion is the guardian spirit of his tribe.

This ability to conceive and communicate the imaginary allows us to engage in flexible mass-cooperation.

- Bees and ants can operate in large colonies using information stored in their DNA, but they can't change these systems easily, nor cooperate based on ideas like the glory of their species.

KEY QUOTES

"Homo sapiens has grown so accustomed to being the only human species that it's hard for us to conceive of any other possibility...(we) imagine that we are the epitome of creation, and that a chasm separates us from the rest of the animal kingdom."

"The truly unique feature of our language is...the ability to transmit information about things that do not exist at all."

- Chimpanzees have social groups and alliances, but they need *intimate interaction* to build trust. This limits their groups to less than 100 (and typically 20-50). They also can't convince others to give up food now in order to gain salvation and unlimited food in chimp-heaven after they die.

- Humans, too, cannot handle >150 intimate relationships at any one time. However, we can conjure *myths and common beliefs*— be it religion, human rights or equality—to get large numbers of strangers to work together.

Most of our modern systems and institutions are built on imagined realities. A company is only real because of our imagined concepts of legal systems, profits, employees, and shareholders.

- Yet, imagined entities like nation-states and Google can reclaim land, build structures and develop new technologies to *shape the real world* around us.

- This frees us up to create and change our imagined reality, *transforming our social structures* in just 1-2 decades when other animals take thousands of years to do so via biological evolution.

Life of the Hunter-Gatherers

Agriculture and industrialization only occurred in the last 10,000- 12,000 years. Our biological, psychological and social traits were mainly shaped by how the pre-agricultural Sapiens lived.

These ancient foragers lived a nomadic lifestyle, traveling in small, intimate groups. They consumed *a wide range of foods*, from berries and roots to termites, rabbits and bison. They probably worked only 30-35 hours a week, gathering, hunting, preparing food and making tools etc. They were also probably *animists* who believed in sharing the lands with plants, animals, rocks and rivers alike.

KEY QUOTES

"Any large-scale human cooperation—whether a modern state, a medieval church, an ancient city or an archaic tribe—is rooted in common myths that exist only in people's collective imagination."

"Imagined orders are not evil conspiracies or useless mirages. Rather, they are the only way large numbers of humans can cooperate effectively."

"The average forager had wider, deeper and more varied knowledge of her immediate surroundings than most of her modern descendants…Survival in that era required superb mental abilities from everyone."

Conquering the Planet

Initially, all *Homo* species were living on the Afro-Asian landmass. With the Cognitive Revolution, Sapiens could now cross the seas/oceans. About 45,000 years ago, Sapiens flooded to other continents, bringing drastic changes to the new habitats we settled in.

- Within a few thousand years of our arrival in Australia, 23 of 24 species of *large animals* became extinct. Within 2,000 years of our arrival in the Americas, we brought extinction to 34 out of 47 genera of large mammals in N. America, and 50 out of 60 in S. America. Many other smaller species were also wiped out. The same happened in other places around the globe.

- *Other Homo species* also become extinct about 30,000 years ago.

Sapiens probably brought such massive destruction because:

- Using *fire*, we could destroy large stretches of ecology. As we change the vegetation and food sources, some animals thrived while others died out.

- *Large animals* and predators generally bred more slowly. They couldn't evolve fast enough to evade the new threat from Sapiens, nor replenish their numbers as quickly as we killed them.

- These factors amplified the impact of *climate change*, which already strained the ecosystem.

Sapiens are no doubt the most destructive species on earth. Each revolution brings a new wave of extinction. Soon, even the surviving species (e.g. sharks, whales) may die out.

KEY QUOTES

"No other animal had ever moved into such a huge variety of radically different habitats so quickly, everywhere using virtually the same genes."

"Humankind ascended to the top so quickly that the ecosystem was not given time to adjust."

"Don't believe tree-huggers who claim that our ancestors lived in harmony with nature. Long before the Industrial Revolution, Homo sapiens held the record... for driving the most plant and animal species to their extinctions."

The Agricultural Revolution

Myth of a Better Life

About 10,000 years ago, we completed the transition from foraging to settle down in farms. Farming supposedly gave us a better life, but Harari calls it the biggest fraud in history.

Farming led to poorer nutrition, more diseases, much longer working hours and a tougher life for Sapiens and other animals.

- Farmers grew a *limited range of crops*—e.g. wheat, maize, potato, barley—because these were the easiest to grow on a large scale. Malnutrition became a common problem.

- As Sapiens *domesticated animals*, the most aggressive ones were culled while the fat, submissive ones were bred. Over time, chicken, sheep, pigs and cows multiplied but lived miserably. Males were castrated or mutilated to break their spirit, females were repeatedly impregnated, and most were kept in tiny space for the short periods before they were killed.

The only advantage of farming was the increase in food per unit area. This allowed humans to multiply exponentially.

- As families grew bigger, farmers cleared more and more lands, changing the landscape and driving new species to extinction. New generations grew up without knowledge of foraging and gradually, it became *impossible to turn back the clock*.

- Throughout history, we see mankind repeating the *luxury trap*. To have a better life, we seek higher productivity, which brings "luxuries" that we soon can't live without. So, we work harder and create more tools to ease our workload, resulting in an ever-increasing pace of life.

KEY QUOTES

"The average farmer worked harder than the average forager, and got a worse diet in return."

"A series of trivial decisions aimed mostly at filling a few stomachs and gaining a little security had the cumulative effect of forcing ancient foragers to spend their days carrying water buckets under a scorching sun."

"Once people get used to a certain luxury, they take it for granted. Then they begin to count on it. Finally they reach a point where they can't live without it."

The Agricultural Revolution also brought new imagined orders.

- With food surplus and new technology, more people were packed into villages and cities, and new *kingdoms and empires* were born. Myths about royalty, imperial glory and gods emerged, holding the new social structure together.

- Unlike foragers who thought of the hills and forests as their home shared with other beings, farmers *defined their homes* as the physical houses they lived in; pests like rats and locusts were now seen as invaders of human territories.

- Farmers constantly *worried about the future*. They had to plan for planting and harvesting, store food in case of poor harvests, droughts or pestilence. 90% of the population (the peasants) *worked from dawn to dusk* while 10% of the elites (kings, priests, officials, soldiers) enjoyed the riches.

Stories Made Real

All human systems of cooperation are built on some hierarchy between people, often involving mass oppression and exploitation.

- People are constantly being *segregated*, e.g. men vs women, whites vs blacks, higher vs lower castes. Today, someone may frown upon racial discrimination, yet think it's ok to have different schools for the rich vs poor.

- *Hierarchies* give a framework for interaction, but limit individual potential. Those in the lower rungs usually lack the chance to develop their talents/skills and have to play by a different set of rules.

Every imagined order has fictions to justify its elites' privileges and behaviors. How do we know if something is real or fiction?

- Harari recommends this rule of thumb: "*Biology enables, Culture forbids*". Anything that exists (e.g. homosexuality) is biologically possible and natural, even if culture claims it's prohibited. On the other hand, if humans don't photosynthesize or fly with wings, then it's biologically unnatural.

KEY QUOTES

"While human evolution was crawling at its usual snail's pace, the human imagination was building astounding networks of mass cooperation, unlike any other ever seen on earth.

"While agricultural space shrank, agricultural time expanded."

"Most human cooperation networks have been geared toward oppression and exploitation."

"We like to see underdogs win. But there is no justice in history."

"Most people claim that their social hierarchy is natural and just, while those of other societies are based on false and ridiculous criteria."

- From a biological viewpoint, *rights don't exist*—birds fly because they have wings, not because they have the right to fly. Women can give birth, but it doesn't give them the right nor obligation to bear children.

In order to be stable, an imagined order must meet 3 criteria:

- *Exist in our material world*. Individualism is made real when we have private homes, when people recognize our contributions or seek permission to use our things.

- *Be linked to our personal desires*. Today, Romanticism and Consumerism are 2 of the biggest imagined orders. *Romanticism* teaches us find our sense of self by having more experiences—to open ourselves to more emotions, see more cultures etc. *Consumerism* teaches us to consume as much goods and services as possible, be it dining and traveling experiences or skills and knowledge. Today, your wife may want you to bring her on a romantic trip to Paris, whereas in ancient Egypt, she would've wanted you to build a tomb for her; such desires are merely reflections of our imagined orders.

- *Be inter-subjective*. An *objective reality* (e.g. gravity) exists regardless of whether we believe it. A *subjective reality* exists only in an individuals' mind (e.g. a child's imaginary friend). An *inter-subjective* reality is a subjective belief held by many people; it persists even if several people stop believing it.

Many of history's **key drivers**—law, money, gods, nations—are intersubjective. They involve a large number of believers, elite and masses alike. Often, these beliefs are so *deeply indoctrinated* from childhood that people mistake them as objective realities. The only way to change an inter-subjective belief system is to get lots of people to believe in an even bigger imaginary order, e.g. personal freedom instead of the glory of an empire.

KEY QUOTES

"Evolution is based on difference, not equality... Equally, there are no such things as rights in biology."

"Though the imagined order exists only in our minds, it can be woven into the material reality around us, and even set in stone."

"There is no way out of the imagined order. When we break down our prison walls and run towards freedom, we are in fact running into the more spacious exercise yard of a bigger prison."

Keeping Records

Other animals don't need lawyers or written rules to operate. However, Sapiens' systems are based on imagined truths which cannot be encoded in DNA.

Writing was instrumental in helping us to preserve vital data like laws, tax payments, debt and property ownership. **Numbers** also became an important form of language, allowing us to think in quantitative terms and deal with concepts like relativity and quantum mechanics which would otherwise be hard to grasp.

With more data, we needed processes to catalogue, store and retrieve the data. These gave rise to *bureaucracy and compartmentalized thinking* based on categories and labels (as opposed to free association and holistic thinking). Today, we're relying on *increasingly-smarter computers* to process data better than us. It's possible that computers can one day become intelligent enough to replace humans altogether.

The Unification of Humankind

Our culture is the sum of the instinctive ways we think and act.

- Every culture has its norms, values and beliefs. These constantly change and often clash, yet we have a unique ability to hold *contradictory beliefs and values*, e.g. we may believe in freedom and equality, yet we accept that a society needs rules and hierarchy to function.

- We tend to think of the world in terms of *"us" vs "them"*. For the bulk of history, Sapiens lived in isolated pockets, totally ignorant of others' existence. Over time, these small/simple cultures connected and gradually *converged* into fewer large/complex cultures. Today, most of us think of the planet as a whole, sharing similar concepts like nation-states, currencies, and legal systems. There are *3 major unifiers of mankind*—money, empire and religion.

KEY QUOTES

"Writing was born as the maidservant of human consciousness, but is increasingly becoming its master."

"Every culture has its typical beliefs, norms and values, but these are in constant flux."

"Over the millennia, small simple cultures gradually coalesce into bigger and more complex civilisations, so that the world contains fewer and fewer megacultures, each of which is bigger and more complex".

Money

- Hunter-gatherers and early farming communities transacted by bartering goods. However, this became exponentially more complex as more goods were involved.

Money became the solution; it allowed sellers to price their goods using a single currency, and convert anything into anything else.

- Money is an *inter-subjective reality*. It has value only because we trust others to accept it in exchange for what we want.

- We started with currencies that had value, like barley and gold/silver. As our *trust in money* grew, we moved to fiat currency with no intrinsic value, and now electronic currency with no physical existence.

Money made it possible for strangers and even rivals to cooperate. However, it also diluted human relations and values. Starving parents used to sell their kids to slavery and we tend to lose trust in people if they run out of money.

Empire

In the last 2,500 years, empires (which ruled over multiple peoples, cultures and territories) were the most common political system, and a driver of cultural convergence.

- Typically, the conquered peoples were mass slaughtered and assimilated, such that they *forgot their origins* over time. Egyptians think of themselves as Arabs, when their Egyptian ancestors were actually crushed by the Arabs in the 7th century. The Zulus in South Africa are in fact descendants from tribes that fought *against* the Zulu Empire in the past.

- The cultures that spread are usually a hybrid between that of the ruling elite and the new subjects. A *common culture* facilitates the flow of ideas/goods/people across borders, and gives the elites legitimacy for bringing a "superior culture" to the conquered lands. For example, Qin Shi Huangdi was hailed as the emperor who united China and brought the golden ages of order and justice.

KEY QUOTES

"Money is…a universal medium of exchange that enables people to convert almost everything into almost anything else."

"Money is the most universal and most efficient system of mutual trust ever devised."

"Most imperial elites earnestly believed that they were working for the general welfare of all the empire's inhabitants."

- Despite the bloodshed and loss of culture, empires often brought progress, e.g. armies and technology. Indians' democracy, command of English, railway network, legal system, cricket, tea culture etc., are all legacies from being a former British colony.

- Today, the world is still divided politically, but nation-states have much less independence, due to international NGOs, global markets and agendas like global warming and human rights.

Religion

A religion must have binding norms and values which are based on a superhuman order. It legitimizes imagined realities (e.g. "eating pork is a sin") by claiming they come from a superhuman entity.

Over time, mankind has embraced various religions. Today, most of us share certain ideologies and adopt a mix of beliefs and practices.

- *Animists* see human beings as merely one of the creatures inhabiting the world and should live in harmony with other plants and animals, e.g. cutting a tree would anger the tree spirit.

- As Sapiens became farmers, we wanted control over our animals. *Theism* (belief in Gods) emerged. Farmers treated Gods as mediators, sacrificing animals in return for a bumper harvest.

- *Polytheists* believe in multiple supreme gods (e.g. Zeus, Apollo, Hera), each with a subset of power, interests/biases and can be negotiated with. Polytheists are more open-minded and accepting of pluralist gods from other religions/cultures.

- *Monotheists* believe in only 1 supreme God; they tend to be more fanatical and missionary, often trying to discredit and even eliminate other religions. Both Christianity and Islam were beliefs held by minority groups, but were spread universally by their single-minded followers. Christians

KEY QUOTES

"As of 2014, the world is still politically fragmented, but states are fast losing their independence."

"Today religion is often considered a source of discrimination, disagreement and disunion. Yet…religion has been the third great unifier of humankind, alongside money and empires."

even prosecuted other Christians to defend their interpretation of the religion.

- *Dualism* says that there are 2 powers—a good and a bad. Many Monotheists today hold dualistic beliefs (e.g. God vs Devil, Heaven vs Hell), which were not found in the Old Testaments.

- Today, the main religion is probably *Syncretism*, i.e. the blend of ideas and practices from various sources. Most Monotheists also concurrently embrace capitalism, liberalism etc.

Humanism (the worship of humans) is the leading ideology today, coexisting with other religions. It has 3 main branches:

- *Liberal Humanism* (the most dominant) focuses on humans' sacrosanct right for freedom and equality.

- *Social Humanism* focuses on human equality in a collective way.

- *Evolutionary Humanism* focuses on our species' progress. According to science, humans have no souls or free will; human behaviors are all about hormones, genes and synapses, which can be manipulated or enhanced. If this became the dominant ideology, it could drastically change present judicial and political systems.

The Scientific Revolution

A Leap in Progress

Since the Cognitive Revolution, humans have sought to understand the universe. However, science brought a massive leap because:

- It admits that we don't know everything, and *any assumption can be proven wrong*; and

KEY QUOTES

"99 per cent of Buddhists did not attain nirvana....they devoted most of their present lives to the pursuit of mundane achievements."

"At the dawn of the third millennium, the future of evolutionary humanism is unclear."

"The willingness to admit ignorance has made modern science more dynamic, supple and inquisitive than any previous tradition of knowledge."

- It links observations and mathematical tools into *comprehensive theories*, which can then be *tested and applied* to new solutions.

By contrast, religious texts were treated as the whole and absolute truth. Lightning was believed to be a sign of Gods' wrath, until Benjamin Franklin disproved it with lightning rods. Malnutrition, disease and even death are now seen as problems to be solved by science rather than left to the will of God.

However, science is still driven by economic, political, and religious agenda. Ultimately, the people/institutions who provide the *funds* decide where to focus scientific research and how to apply the discoveries. Indeed, our explosive scientific progress can be attributed the *interaction of science, empire and capital*.

Science + Empire

From 1750-1850, several Western Europe nations became economic powerhouses. Other western nations followed suit, but not the Arab world, India and China. It was not because Europeans were technologically superior, but because science and capitalism gave them a huge appetite for exploration and conquest.

- Admiral *Zheng He* of the Chinese Ming dynasty also led many sea expeditions; in fact, his ships and fleet sizes were hundreds of times bigger than Colombus'. Yet he didn't try to conquer other countries; his focus was on exploration and assisting pro-Chinese rulers.

- Europe's series of *territorial conquests* started after European intellectuals started working with capitalists for profit. As they "discovered" distant lands, they claimed them for their kings, killing and enslaving entire populations.

- In 1517, 300 Spaniards landed in Mexico, home of the powerful *Aztec empire* with millions of people. The Spaniards pretended to be friendly diplomats, then held the Aztec king hostage while they planned a coup. By the time the Spaniards were kicked out, they had cultivated a local

KEY QUOTES

"Science is unable to set its own priorities. It is also incapable of determining what to do with its discoveries."

"Most scientific studies are funded because somebody believes they can help attain some political, economic or religious goal."

"What made Europeans exceptional was their unparalleled and insatiable ambition to explore and conquer."

"For modern Europeans, building an empire was a scientific project, while setting up a scientific discipline was an imperial project."

rebel base. Once the rebels overthrew the Aztec rulers, the Spanish colonists killed 90% of the local population and imported African slaves to fill the vacuum.

- The same story was repeated elsewhere. Being *ignorant of the outside world*, the locals didn't know what to expect. The Europeans were like aliens from space—they arrived in strange vessels, looked and smelled different. The Ottomans, Indians and Chinese also heard of the western "barbarians" but dismissed them as being too far away; the Europeans eventually invaded Asia.

Science also helped to legitimize European conquests so they could rule over populations far bigger than theirs.

- The imperialists did bring modern medicine, railroads, judiciary systems etc. to the conquered lands, and financed the study of local linguistics, botany, geography and history. These gave *ideological justifications* of progress and knowledge acquisition.

- Western scholars also used scientific theories to argue that the Aryans—tall, blue-eyed, blond, fair-skinned and super-rational— were a *superior race* meant to dominate the inferior races.

Science + Capitalism

Money can convert anything to anything else. However, the pie remains fixed if you can only use existing money to buy what already exists. The ultimate driver for our modern economy is growth, powered by credit. Credit works on the belief that something built today can bring far more returns in the future. This trust in the future allows credits to be given, creating real economic growth to generate even more trust and credit.

Capitalism says that wealth is good because it'll be reinvested in productive activities to bring even more wealth. Some even argue that the market should operate freely with no political interference.

KEY QUOTES

"Histories of botany have little to say about the suffering of the Aboriginal Australians, but they usually find some kind words for James Cook and Joseph Banks."

"The European empires did so many different things on such a large scale, that you can find plenty of examples to support whatever you want to say about them."

"Credit is the difference between today's pie and tomorrow's pie."

"This is the fly in the ointment of free-market capitalism. It cannot ensure that profits are gained in a fair way, or distributed in a fair manner."

- In reality, *the rich don't always reinvest their wealth*. Money wasted on luxuries doesn't create future growth. An unregulated business may also try to maximize profits by exploiting its workers rather than reinvest its resources.

- Without regulation, the market can create *huge bubbles*, like the Mississippi Bubble of 1719 and the US housing bubble of 2007, which brought massive losses when they burst.

Capitalism needs to be sustained by infinite growth. Can we really grow indefinitely and what will it take?

- Growth requires *resources*, e.g. energy and raw materials, which are finite. Yet, science has consistently unlocked *new* energy sources and more *efficient* ways to use current energy sources. With the right technology, we have potentially unlimited ways to tap energy from the sun, gravity etc.

- To feed our growing population, we *mass-produce animals* for food like objects in a production line. Studies show that animals *do* have social/psychological needs and can feel both physical and emotional pain. Yet, an average hen today is likely to be fed adequately, but is squeezed into such a tiny cage that it can't flap its wings or stand erect.

- With more products and services being produced, we also need more buyers. *Consumerism* encourages people consume more and more of things they don't really need. Obesity is great for business—first people spend on food, then they buy medication to lose weight or treat diseases.

Capitalism is likely to only increase the gap between the rich and the poor. Yet, similar to the Agricultural Revolution, we've come so far now that it's too late to turn back the clock.

A Permanent Revolution

Many of mankind's recent/ongoing changes are irreversible.

- There's no doubt our *ecosystem* is degenerating rapidly. We're permanently losing natural habitats and species as we convert environmental resources into energy and goods,

KEY QUOTES

"For better or worse, in sickness and in health, the modern economy has been growing like a hormone-soused teenager. It eats up everything it can find and puts on inches faster than you can count."

"Any type of energy, anywhere in the world, might be harnessed to whatever need we had, if we could just invent the right machine."

"(Animals) pass their entire lives as cogs in a giant production line, and the length and quality of their existence is determined by the profits and losses of business corporations."

"The human species and the global economy may well keep growing, but many more individuals may live in hunger and want."

"Ecological degradation is not the same as resource scarcity."

and replace the oceans and forests with roads and buildings. Wild animals are now a tiny fraction of the number of humans, domesticated animals, and other species like rats and cockroaches.

- We're now all bound to *modern clock time*. Most human activities are tied to specific timetables and templates, from school to offices, transport networks and TV programs.

- The *family and community* have been ousted by markets and nation-states. In the past, people depend on the family/ community for survival. Today, the laws, tax and other systems protect and hold us accountable as *individuals*; we can travel, communicate, have our own bank accounts etc. Our views are shaped by compulsory education, mass media and the products/services we consume. We even form new *imagined communities* like nationality (e.g. Germans vs Americans) and consumer tribes (e.g. Arsenal vs Liverpool football fans). The family has lost its central role.

- With *constant and rapid changes*, social order is now seen as a flexible concept rather a fixed ideology.

- We're enjoying more *peace* today than ever before. The average person is more likely to kill himself than to be killed by a soldier, terrorist or criminal. For the first time in history, war is unlikely, due to global trade and finance, humanist ideologies and the threat of nuclear weapons.

Intelligent design could also shape the future of evolution in at least 3 ways, potentially bringing an end of *Homo sapiens* as a species.

- *Biological engineering* is being used to modify our biology. Plants and animal genes are already being modified to increase lifespan, good fats etc. Besides transforming living creatures, scientists also aim to bring back extinct species.

- We're increasingly integrating bionic components into our bodies, such as bionic arms that are operated by thought. It's a matter of time before we can create *cyborgs* or entirely new beings.

KEY QUOTES

"It is sobering to realise how often our view of the past is distorted by events of the last few years."

"Any attempt to define the characteristics of modern society is akin to defining the colour of a chameleon. The only characteristic of which we can be certain is the incessant change."

"Real peace is not the mere absence of war. Real peace is the implausibility of war."

- *New inorganic life*. Today, computer viruses can replicate themselves in cyberspace. It's conceivable that—by design or mistake—we'll one day create a virus that can survive and evolve on its own in cyberspace, giving computers the ability to think consciously like us.

Conclusion

Lessons from History

History cannot help us to predict the future; it can only broaden our perspectives.

- It's easy to look back with hindsight and think we know why things happened. In reality, history is chaotic and *can never be predicted*. A tiny, seemingly-insignificant variable could trigger an unforeseen series of events. Even if you could accurately predict say, tomorrow's stock prices, the market will respond to your prediction and render it invalid.
- Mankind has undoubtedly transformed Earth and our realities in just a short period of time. With each revolution, Sapiens became more productive and powerful. But, *has progress brought us greater happiness?* Or has our collective evolutionary success brought only more individual suffering to ourselves and other species (like the cows and pigs in their pens and the mice in the labs)?

While none of us can individually direct history, we can seek to understand it and make conscious choices that collectively influence our future.

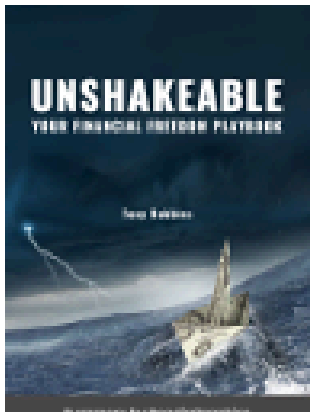
Other Details in the Book to Look out For

This book is packed with historical facts, events, research and theories. Harari uses vivid examples that transport you back to the different eras, presents various perspectives and invites you to ponder questions about mankind's rise to dominance and what it means for our present and future. In this summary, we've outlined some of these key ideas. Harari covers many other details, including facts and theories about:

KEY QUOTES

"History cannot be explained deterministically and it cannot be predicted because it is chaotic."

"History's choices are not made for the benefit of humans. There is absolutely no proof that human wellbeing inevitably improves as history rolls along…because we lack an objective scale on which to measure such benefit."



UNSHAKEABLE

Your Financial Freedom Playbook

TONY ROBBINS
(WITH PETER MALLOUK)

The Big "So What"

How do financial masters like Warren Buffett, Alan Greenspan and David Swensen win in financial markets, and what can we learn from them? Based on insights from 50 financial masters, this book explains the rules of the financial game, the key players and their agenda, and how you can ride the financial storm to arrive safely at your desired destination.

Introduction

Today's financial markets seem more volatile and uncertain than ever. Since the last financial crisis of 2008, the American stock market has been on a bull run, and people are anticipating an impending crash.

Over 7 years, Robbins interviewed some 50 financial masters, including self-made billionaires, legendary investors and the top financial minds, like Warren Buffett, Alan Greenspan, David Swensen, Ray Dalio, Jack Bogle, Mary Callahan Erdoes, T. Boone Pickens, Carl Icahn and John Paulson. This culminated in his earlier book "*Money: Master the Game*". This book, published in 2017, zooms in on the current market fears and realities, and what the average person can do to build your financial freedom. While the book is US-centric, the ideas are applicable to anyone interested to improve your financial future and retirement plans.

Being Unshakeable

What if you knew that no matter what happens to the economy, you'll be financially secure, and have more than enough for yourself, your loved ones and your contributions? That deep sense of peace and freedom is what being "unshakeable" means. It gives you control and puts you in the driver seat.

KEY QUOTES

"The decisions you will be equipped to make after reading this short book can bring you a whole new level of inner peace, fulfilment, comfort, and financial freedom that most humans only dream of achieving."

"What most people really want, regardless of how much money they have today, is freedom."

"Money is only a tool. It will take you wherever you wish, but it will not replace you as the driver."
- Ayn Rand

"It's not just a matter of money. It's a state of mind. When you're truly unshakeable, you have unwavering confidence even amidst the storm."

In this book, Tony coaches you to make sense of the financial markets, and develop an action plan to get you to your goals. This summary is presented in 3 parts:

- Know the Rules
- Your Unshakeable Playbook
- Mastering the Psychology of Wealth

Part 1: Know the Rules

To win the game, you must know the rules. In this segment, we'll look at several important financial concepts and facts.

Financial Markets 101

Compounding is a powerful force to leverage for your financial goals. Let's look at 2 scenarios:

Person A	Person B
Invests $300 a month for 8 years (19 to 27 y.o.) at 10% compound returns per year.	Invests $300 a month for 38 years (27 to 65 y.o.) at 10% compound returns per year.
Total capital invested: $28,800 Amount at 65 y.o.: $1.86 mil	Total capital invested: $140,000 Amount at 65 y.o.: $1.59 mil

- Simply by *starting earlier*, you can harness the power of compounding to build a larger nest egg with a fraction of the capital. You can retire comfortably even with a small income.

- The key is to *pay yourself first*. Set aside, say, 10% of your monthly income for your financial freedom fund, before you pay for other expenses. Even if you're struggling financially, you can start with 3%, then gradually increase it to 10% or even 15% over time.

- As a *rule of thumb*, to be financially secure, you should aim to retire with 20x of your current income, i.e. if you earn $100,000 a year, you should aim for $2mil retirement funds.

KEY QUOTES

"You can't win this game unless you have the emotional fortitude to get in it and stay in it for the long term."

"You're never going to earn your way to financial freedom. The real route to riches is to set aside a portion of your money and invest it so that it compounds over many year."

Here are several basic terms/ concepts to know:

- *Terms*: If a market falls by ≥10% from its peak, it's called a "correction". If it falls by ≥20% from the peak, it's called a "bear market".

- There are 3 main *types of funds*:

  - *Hedge funds* are private funds for high networth clients. Fund managers usually charge 2% management fees and a profit share (of say, 20%).

  - *Mutual funds* are portfolios of stocks, bonds or assets, that are available to anyone. They form the majority of funds in the market. Such funds are actively managed by professionals, who charge fees for their services, supposedly to deliver better-than-market returns. However, we'll show later how 96% of such funds are actually underperforming.

  - *Index funds* are public funds with no "active" managers. They simply buy and hold all the stocks in an index, e.g. all 500 stocks in the S&P 500 index.

Know the 7 "Freedom Facts"

These 7 facts will help to free you from much of the irrational fear and anxiety about financial markets.

Corrections happen annually on average. Since 1900, there has been about 1 correction per year, lasting 54 days each, on average. The average correction was 13.5% (over the last 100 years) or 14.2% (from 1980-2015).

Less than 20% of corrections become bear markets, i.e. 80% do not become bear markets. Thus, corrections are a routine part of the financial markets, and are generally no cause for alarm.

Despite short-term dips, the stock market always rises in the long term. Despite an average 14.2% annual correction and major events (like the Gulf wars and 9/11), the US market showed positive returns for 27 out of the last 36 years. It's hard to be sure any stock or company will do well in the

KEY QUOTES

"The biggest danger isn't a correction or a bear market, it's being out of the market."

"The problem is, most funds do a terrific job of charging high fees but a terrible job of picking successful investments."

"The last thing you and I want is to make fear-based financial decisions."

"Once you recognize the patterns in the financial markets, you can adapt to them, utilize them, and profit from them."

"Prediction is very difficult, especially about the future."
- Niels Boh

long term, but it's safe to assume the stock market will increase in the long run so long as the economy continues to grow and expand.

No one can steadily predict if the market will rise or fall. For example, Dr. Roubini was famous for predicting the 2008 financial meltdown. But, he also incorrectly predicted a recession every year from 2004 to 2007! In the book, Robbins lists many examples of the market going in the opposite direction of "expert forecasts." The good news is, you don't need to predict the market to win. You just need to capture the natural market growth.

Historically, Bear Markets occurred every 3-5 years. There were 34 bear markets in 115 years (from 1900-2015). In less than a third of these bear markets, the index fell by more than 40%.

Bear markets become bull markets. Every bear market in US history has been followed by a bull market, including the 2008 financial crash. Since stock markets look at tomorrow (not today), the lowest point of consumer confidence is always a sign that the market will pick up. However, this may not hold true for all countries—Japan, for instance, never fully recovered to the Nikkei peak after nearly 3 decades since the 1989 crash.

The greatest risk is to be out of the market. JPMorgan found that 60% of the best US market days over the last 20 years happened within 2 weeks of the 10 worst days. In the book, Robbins illustrates how your returns could be greatly reduced just by missing the top trading days. Since you can't predict the market and get in/out successfully, you're better off staying in the market, and tapping on the power of compounding.

Know Your Costs

In the book, Robbins explains why you may be losing huge amounts of your investment to funds that overcharge and underperform.

Fees can destroy 2/3 of your gains. Most actively-managed funds charge about 2% p.a.—these add up to massively erode your gains. At 7% compounded returns, $1 should become $30 in 50 years. But, with 2% lost each year, there's less to compound, and you end up with only $10. In short, you lose

KEY QUOTES

"One of the greatest lessons I've learned from all these money masters is that you don't have to predict the future to win this game."

"The market generally rises over the long run—even though we hit a huge number of potholes along the way."

"Financial winter is always followed by spring."

"One of the most fundamental rules for achieving long-term financial success is that you need to get in the market and stay in it, so you can capture all of its gains."

"If you stay in the market long enough, compounding works its magic, and you end up with a healthy return—even if your timing was hopelessly unlucky."

"When it comes to your finances, ignorance is not bliss."

2/3 of your gains, despite bearing 100% of the capital and risks.

In fact, funds can cost more than 2% p.a. due to **taxes and other hidden costs.**

- Unless the fund is in a tax-deferred account, it's taxed every time the fund managers sell stocks at a profit. The *taxes* could be as high as 30%; that's why most funds show their pre-tax returns (rather than the lower post-tax returns).

- The 401(k) plans in the USA also come with many other *hidden fees and charges* (which we'll touch on later). A Forbes article showed that the true cost of a mutual fund could be 3.17% a year (for a non-taxable account) and 4.17% (for a taxable account).

A study of 203 funds (each with ≥$100mil in assets) revealed that, from 1984-1998, **only 4% of the funds actually beat the S&P 500 index.** In short, 96% of the fund managers didn't add value, despite charging high fees. Why is that?

- Fund managers aren't really better at *predicting* the markets than the layman. Instead, each time they trade a stock, the brokerage firms charge a *commission* for the transaction, and profits may be taxed.

- Fund managers tend to keep some cash on hand in case good opportunities surface, but this means *opportunity cost*.

Robbins recommends that you **buy index funds instead**. Such funds include every stock on the index, thus they are diversified, conduct fewer trades, don't require costly fund managers, and the cash is almost fully invested at all times.

- Index funds typically cost only 0.05%, which is 60x less expensive than an actively-managed fund with 3% fee p.a. At the same compounded returns over 30 years, $100,000 will grow to $865,000 in an index fund, but only $548,000 in an actively-managed fund.

- Even Warren Buffett himself has instructed that the trust money for his wife is to be invested in low-cost index funds after his death. So why not you and I?

KEY QUOTES

"We can't control what the markets will do, but we can control how much we pay for our investments."

-John C. Bogle

"It turns out that the professionals aren't really any better at predicting the future than the rest of us."

Rescuing our Retirement Plans

The US' 401(k) plan was created in 1984 to allow tax-deductible contributions to a retirement account. Unfortunately, this has been exploited by financial firms, at Americans' expense.

Until 2012, financial firms weren't required to disclose how much they charged clients. Even today, disclosure documents are still so complex that it's **hard to decipher the details**. 71% of Americans think they aren't paying any fees for their 401(k) plan, while 92% don't know how much they are paying.

A senior policy analyst at Demos examined 20 funds in his 401(k) plan and found that, in addition to the 3.17% fees mentioned by Forbes, there were **17 other fees and costs**. He estimated that an average worker who earned $30,000 a year and saved 5% of his income would lose more than $154,000 in lifetime fees.

- Most funds listed in the 401(k) plan are actively-managed funds that charge *recurring fees*, or even "*front-end loads*" of up to 3%. These erode your invested capital.

- Low-cost index funds aren't typically included, or are included with a huge *mark-up* (e.g. charges of 1.68% p.a. when the cost is only 0.05%, and/or with additional sales loads).

During the Obama administration, the Congress tried to force the 401(k) providers to act in their clients' best interests, but the **regulations** had nominal impact, and may be reversed under the Trump administration. Teachers, nurses, and non-profit employees could be even worse off, as their 403(b) plans aren't protected by the ERISA (Employee Retirement Income Security Act of 1974).

Robbins found that his own company's 401(k) plan cost 2.17% in annual fees. He switched to Abk, which only charged 0.65% a year, saving 70% of the original annual expenses. Robbins recommends that you **analyse your plan** at www.ShowMeTheFees.com, and switch (or encourage your employer to switch) to better options if need be.

KEY QUOTES

Who can you really trust?

Financial advisors (FAs) can offer great value in your investments, taxes, insurance etc. The challenge is to identify the ones you can trust. Learn to distinguish between 3 types of advisors:

Brokers: 90% of all FAs in America are brokers, i.e. they are paid commissions to sell products. They have to ensure their recommendations are "suitable" for the clients, but need not act in the clients' best interest. Hence, it's common for brokers to recommend products with higher commissions.

Registered Investment Advisors (RIAs). Out of more than 300,000 FAs in the US, only 10% are RIAs. RIAs have a fiduciary duty and legal obligation to act in their clients' best interests at all times. They don't earn a commission, but charge a flat fee for financial advice, or a percentage of the clients' assets under management.

Dually Registered Advisors. Unfortunately, most RIAs are registered both as brokers and fiduciaries. This means they can still make commissions while charging an advisory fee. In fact, some advisory firms have 2 arms—an RIA service and a sister company (under a different brand) that offers mutual funds. In such cases, the RIA tends to be biased toward the sister company funds.

The best option is an RIA who's a true fiduciary—someone who'll put your interest first, and has the necessary skills/experience. Use these 7 questions to filter your FAs:

- Are you a **Registered Investment Advisor**? [If "no", walk away.]
- Are you/your firm affiliated with a **broker-dealer**? [If "yes", walk away.]
- Does your firm offer **proprietary mutual funds or separately managed accounts**? [If "yes", be extra-cautious.]
- Do you/your firm get **third-party compensation** for recommending specific investments? [If "yes", be extra-cautious.]
- What's your **philosophy** on investing? [Make sure your philosophies are aligned (e.g. if they believe in stock-picking vs

KEY QUOTES

diversification), and find someone you can relate to on a personal level.]

- What **financial planning services** do you offer beyond investment strategy and portfolio management? [Ideally, the FA can also help you to save money on mortgage, insurance, taxes etc. as your wealth grows. Check their *credentials* to ensure they have the right skills, e.g. certified financial planners, or estate planning attorneys.]

- Where will my money be held? [An RIA should use a **third-party custodian** to hold your funds. Look for a *strong track record* for other clients like you.]

Robbins recommends Creative Planning (which is run by co-author, Peter Mallouk, and for which Robbins is a board member and Chief of Investor Psychology) as a good FA option to consider.

Part 2: Your Unshakeable Playbook

The Core Four

Success leaves clues. By modelling the patterns of successful people, you can shorten your learning curve. From his interviews, Robbins found 4 key principles that all great investors use to guide their investment decisions. He calls them the "Core Four".

The principles may seem simple, but the challenge is to actually apply them, and enter an investment only if it meets all 4 criteria.

Don't Lose. It's much harder to make back what you've lost than to protect your investments. The best solution is to *diversify your asset allocation*, such that you're ok even if the market moves in an unexpected way. Only consider an investment if you can minimize the downside.

Asymmetric Risk/Reward. "High-risk, high-return" is an investment myth. The smartest investors look for opportunities where the *rewards greatly outweigh the risks*. For instance, Richard Branson started Virgin Atlantic Airways by negotiating a deal that allowed him to return the planes if the business didn't work out—this minimized his downside

KEY QUOTES

"The key is to recognize these consistently successful patterns and to model them... These patterns provide the playbook for your success."

"The more money you lose, the harder it is to get back to where you started."

"These winning investors always seek to risk as little as possible to make as much as possible. That's the investor's equivalent of nirvana."

while preserving his upside. You can apply this principle by investing in undervalued assets during times of extreme gloom and pessimism. That's one of Warren Buffett's strategies, though he typically restructures his investments to further improve the asymmetry.

Tax Efficiency. Taxes can easily wipe out 30% or more of your investment returns. Rather than look at pretax returns, you should maximize your *net returns*. As a rule of thumb, stay away from actively-managed funds that trade a lot.

Diversification. Don't put all your eggs in one basket. You can diversify *across asset classes* (e.g. real estate vs stocks), *within asset classes* (e.g. different types of stock), and *across markets, countries, currencies, or time*.

Prepare for the Bear Market

Surviving a bear market is 90% preparation and 10% staying calm during the storm. Co-author Peter Mallouk shares how Creative Planning handled the 2008 crisis, and grew the firm's assets-under-management from $500mil in 2008 to more than $1.8mil in 2010, and $22 bil in early 2017. You can use the same approach and principles to prepare for and survive the next bear market.

Customize your asset allocation to meet your goals, based on your unique financial situation, and to minimize your tax liabilities. Your portfolio could include these components:

- *Stocks* are basically partial ownership of businesses. In the short run, stocks are completely unpredictable. But in the long-run, economic growth always drives up stock prices. Thus, the key is to live within your means, so you won't be forced to sell your stocks during a bear market to free up cash.

- *Bonds* are money that you loan to a government, company or other entity. Your returns will depend on the risk and duration of the loan. Bonds are less risky, but the yields are also generally low. During the 2008 crisis, Creative Planning sold some of the clients' bonds to buy stocks.

KEY QUOTES

"It's not what they earn that counts. It's what they keep. That's real money."

"You can never know what the stock market will do. But that uncertainty isn't an excuse for inaction."

"Bear markets are either the best of times or the worst of times, depending on your decisions."
- Peter Mallouk

"A simple rule dictates my buying: be fearful when others are greedy, and be greedy when others are fearful."
- Warren Buffett

- *Alternative investments* are anything other than cash, stocks or bonds, and can include: Real Estate Investment Trusts (REITs), Private Equity Funds, Master Limited Partnerships, Gold, Hedge Funds.

Creative Planning uses these "**Core and Explore**" principles:

- *Asset allocation drives returns*. Work with a qualified advisor to customize your mix of stocks, bonds, and alternatives. Diversify your portfolio by investing in different asset classes, so you balance out the risk characteristics and rates of return, to get your overall desired returns at an acceptable risk level.

- Always have a *financial cushion*, so you won't be forced to sell your stocks at the wrong price. Creative Planning uses the "rule of seven", i.e. ideally have 7 years of income set aside in income-producing investments (e.g. bonds and MLPs), so you can use these assets in the short term if the stock market crashes.

- Use *index funds* for the core of your portfolio, and explore other stocks and alternatives at the margins.

- *Rebalance* your portfolio (say, annually) to keep it to your original asset allocation.

Putting the above in place will allay some of your fears and prepare yourself to weather a bear market.

Part 3: Mastering the Psychology of Wealth

Neuroscientists found that the parts of our brain that process financial losses are the same ones that deal with mortal threats. During a financial crisis, our fight-freeze-flee instinct kicks in and we sabotage our own financial goals. The solution is to establish systems to neutralize our natural human tendencies, e.g. Paul Tudor Jones sets up checklists and systems to ensure he sticks to his success formula: only go for hard trades with asymmetric rewards/risk of 5:1, and stick to his target entry/exit prices.

KEY QUOTES

"The short-term outlook may look dire, but the stock market always rebounds."

"The single biggest threat to your financial well-being is your own brain."

"Psychology either makes you or breaks you, so it's imperative to have a robust system that enables you to stay on target."

Mastering your Mind: Overcoming 6 Common Mistakes

Positive Biases. Humans find evidence to support what we already believe (confirmation bias) and place more value on what we already own (endowment effect). To avoid biases toward stocks/funds that we like/own, *seek differing opinions* from qualified people. Ask questions like: What am I missing? What's the downside? Who else can offer a deeper perspective?

Recency Bias. Investors tend to assume the recent trends will continue into the future. Thus, they tend to buy high during a bull market and sell low during a bear market. To avoid poor, emotional choices, *create a list of simple rules*, so you can rebalance and stay on target when you're emotional.

Overconfidence. We tend to overestimate ourselves, including our ability to predict the future or pick the right stocks. Be honest with yourself—acknowledge that you're unlikely to outwit the top investors or beat the market. Instead seek to *capture the market returns* and invest in index funds instead.

Greed & impatience. We've explained why long-term compounding is the smartest way to invest. Yet, we fall for media hype and take gambles in hope of quick gains. Short-term speculations always lose out to *long-term investing*. Guy Spier recommends that you stop watching the market and financial news daily; instead, check your portfolio only once a year, so you'll maintain a long-term focus.

Home bias. We tend to invest more in what we're familiar with, e.g. our own country or industry. *Diversify broadly* into different asset classes and countries. Write down why you own what you own, as a *reminder* to yourself when things look less rosy.

Negative Biases. Humans tend to recall negative experiences more vividly than positive ones (negativity bias), and we feel twice as much pain from losses than pleasure from gains (loss aversion). During market turmoil, we're flooded by fear of potential losses. To overcome this, *be prepared*—put the above measures in place, and have a seasoned FA who'll keep you on-track during tough times.

KEY QUOTES

"Investors project out into the future what they have most recently been seeing."
- Warren Buffett

"By admitting to yourself that you have no special advantage, you give yourself an enormous advantage!"

"The best way to win the game of investing is to achieve sustainable long term returns."

"The single best way to handle market turmoil—and the fears it can trigger—is to be prepared for it."

Real Wealth

Money is just the means to an end. Fundamentally, all of us desire an amazing life; we want to be rich not for money per se, but for the *emotions* associated with money, e.g. freedom, respect, security. Robbins ends the book by sharing how we can achieve both financial and emotional wealth, by mastering 2 additional skills:

Achievement (mastering your external world):

- When you *focus* fully on something, your brain will find a way to help you achieve it.
- *Take massive action*, and refine your approach to find an effective strategy. Studying role models speeds up your learning.
- The more you're grateful for *Grace* (or luck/God) in your life, the more it flows to you.

Fulfilment (mastering your internal world):

- *Progress*: To be happy, you must keep growing.
- *Give*: The key to fulfilment is to satisfy our inherent desire to contribute.

In fact, there's one decision that you can make to start transforming your life this instant: choose to be in a Beautiful State of mind (where you're alive, in harmony with yourself and feel positive emotions like love, joy, gratitude, ease, and fun), rather than a Suffering State (where you're stressed, worried, frustrated, fearful etc.).

- Our **suffering** is triggered by thoughts of *loss* (or potential loss), having *less* of something we value, or believing we can *never* have something we want (e.g. love, respect).
- You can choose a beautiful state of mind, simply by **shifting the focus** of your thoughts.
  - *90-second rule*: Once you catch yourself having negative thoughts and tension, take a breath, step away from the situation, and focus instead on something (anything) that you appreciate. Don't allow the negative thoughts to fester.

KEY QUOTES

"Real wealth is emotional, psychological, and spiritual."

"Wherever your focus goes, your energy flows."

"The more you acknowledge grace in your life, the more you seem to have it!"

"Everything in life either grows or dies."

"I can tell you the secret to happiness in one word: progress."

"If you make the decision to master your own mind, you'll be mentally equipped to handle whatever challenges come your way."

"Take all your negative thoughts and all of your negative emotions, trade them for appreciation, and your whole life changes in an instant."

- Use the *2-minute gratitude meditation* to transfer your negative charges to positive charges. A guided recording of the 7-step meditation is available at www.unshakeable.com.

Other Details in the Book to Look out For

In the book, Robbins offers many illustrations and examples to reinforce his message. He also recommends additional resources such as:

- Get free podcasts and videos at www.unshakeable.com, including a free mobile app to help you work out how much you need to save and invest to reach your financial goals;
- Analyze your 401(k) plans and fees at Abk's website www.ShowMeTheFees.com; and
- Get a non-obligatory assessment from one of Creative Planning's wealth managers at www.getasecondopinion.com, to see if your current advisor is indeed working in your best interest.

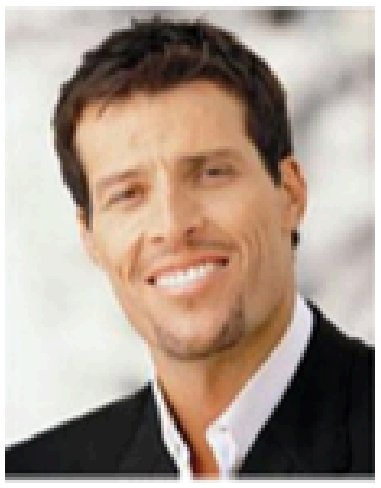
KEY QUOTES

"I truly believe that success without fulfilment is the ultimate failure."

"Remember: money doesn't change people. It just magnifies who they already are."

"If you fail to master your own psychology, you may ultimately become the victim of a costly form of financial self-sabotage."

About the Authors



Anthony ("Tony") Robbins (born 1960) is an American businessman, best-selling author, and philanthropist. He's an authority on the psychology of leadership, negotiations and organizational turnaround, and has served as an advisor to leaders around the world for more than 38 years. He has also created the #1 personal and professional development program of all time, and more than 4 million people have attended his live seminars.

He has been honored by Accenture as one of the "Top 50 Business Intellectuals in the World"; by Harvard Business Press as one of the "Top 200 Business Gurus", and he was recently named in the top 50 of Worth Magazine's 100 most powerful people in global finance. HOMO DEUS

A Brief History of Tomorrow

YUVAL NOAH HARARI

The Big "So What"

Today, Homo sapiens have dominated the world, and brought famine, plague and war under control. Where will we channel our ambitions next, and what could happen as we progressively tweak our genes and incorporate artificial intelligence into our world? In this book, Harari examines our past, present and future, and highlights some difficult questions and choices that could shape our collective future.

Introduction

Over the last century, humans (*Homo sapiens*) have conquered our biggest enemies—famine, plague and war—and ruled the planet as the dominant species.

- In ancient Egypt or medieval India, severe droughts could wipe out 5-10% of the population. The 2 world wars killed about 100 million people, while the "Spanish Flu" wiped out about a third of the global population.

- Today, while millions of people still suffer from hunger or malnutrition, few actually starve to death. Diseases like SARS, Ebola and AIDS are contained, war is rare and people value political, social and economic stability. In fact, more people die today from obesity than from starvation; from old age than from infectious diseases; and from suicide than warfare.

In a healthy, prosperous and harmonious world, what will humans focus our attention on? Will our desire for growth, eternal youth and happiness ironically bring an end to our species? Harari presents his thoughts and arguments through a range of questions, examples, facts and theories, and highlights several

KEY QUOTES

"Given our past record and our current values, we are likely to reach out for bliss, divinity and immortality—even if it kills us."

"Famine, plague and war... are no longer unavoidable tragedies...Instead, they have become manageable challenges."

"Previous generations thought about peace as the temporary absence of war. Today we think about peace as the implausibility of war."

"If incidences of famine, plague and war are decreasing, something is bound to take their place on the human agenda."

questions that could shape our collective outcomes—before it's too late. In this summary, we've distilled and organized the key ideas into 2 parts: "How humans conquered the world" and "Where are humans headed?".

Part1: How Humans Conquered the World

Homo Sapiens: the Dominant Species

Homo sapiens are the first species to single-handedly **change the world's ecology** in 4 billion years since life first appeared on Earth. The appearance of the first Homo sapiens quickly drove other Homo species into extinction. Today, 90% of the large animals around the world are either humans or our domesticated animals. There are only 200,000 wild wolves vs 400 million domesticated dogs, 900,000 African buffaloes vs 1.5 billion domesticated cows.

Over time, our beliefs, ideologies, and relationship with other living creatures have evolved:

Archaic Hunter-gatherers ⟺ *Animism*. Our first sapiens ancestors were probably animists, i.e. they saw humans, animals, plants, rivers and even stones, as an integral part of the ecosystem and landscape.

Agricultural Revolution ⟺ *Theism*. Theists argue that Gods created the universe, favoured humans over other species, and provided us with all we needed. During the Agricultural Revolution, Theism was popularized, and mankind started to see ourselves as a special species. Animals were domesticated, and offered as sacrifices in return for the Gods' blessings. In ancient Egypt, medieval China and biblical Israel, certain "classes" of humans were also treated like "lesser animals", and were enslaved and tortured.

Scientific Revolution ⟺ *Humanism*. As mankind developed new understanding of chemistry, biology and physics, Gods were slowly removed from the picture. Humans can now heal ourselves, improve crops, forecast the weather—all without the Gods' assistance. With science and antibiotics, we could breed thousands of cows, chickens, pigs etc. and pack them into cramped spaces without

KEY QUOTES

"Instead of fearing asteroids, we should fear ourselves. For Homo sapiens has rewritten the rules of the game."

"The farm thus became the prototype of new societies, complete with puffed-up masters, inferior races fit for exploitation, wild beasts ripe for extermination, and a great God above that gives His blessing to the entire arrangement."

"We can be quite certain that humans will make a bid for divinity, because humans have many reasons to desire such an upgrade, and many ways to achieve it."

major epidemics. In the eyes of other animals, humans may well be gods.

Homo Deus ⟺ *Techno-ism?* With plague, famine and war under control, Harari believes that humans will seek to attain eternal youth and bliss. To upgrade ourselves, we'll tweak our biology and develop artificial intelligence (AI). Yet, are these modified super-humans, Homo Deus, really human? We'll discuss this later in Part 2.

Homo Sapiens: Who are We, Really?

Humans want to believe that we're special, and the most commonly used reasons are: humans have eternal souls and/or consciousness, while animals have neither.

Monotheists argue that humans have **eternal souls**; when we die, our souls move on to salvation or damnation. However, there has been *no way to prove* that humans indeed have a soul.

Another argument is that Homo Sapiens have a **conscious mind**. We can perceive subjective experiences (including sensation and desire) and combine them to form a stream of consciousness, to feel "overwhelmed", "fulfilled", etc.

- Consciousness is *proven as a real phenomenon*. When something happens, the body produces electrons and biochemical responses, to give us sensations and desires. Thus, by examining the brain, scientists can tell if someone is awake or sleeping, and if he's afraid or angry; we can even differentiate between the brain neurons associated with different ideas.

- However, as of 2016 when the book was published, we can't explain *how* consciousness is formed, nor what *role* it plays in our evolution. Thus, we can't assume that animals and inorganic beings (e.g. computers) can't be or become conscious.

  Animals like monkeys and dogs certainly demonstrate intelligence and awareness. Lab rats were distressed by other rats being held captive and found ways to free them. A chimpanzee at a Swedish zoo could devise various strategies to discreetly hide objects and throw them at

KEY QUOTES

"The belief that humans have eternal souls... is a central pillar of our legal, political and economic system."

"From an evolutionary perspective, the closest thing we have to a human essence is our DNA...This terrifies large numbers of people, who prefer to reject the theory of evolution rather than give up their souls."

"Desires are nothing but a pattern of firing neurons."

"Scientists don't know how a collection of electric brain signals creates subjective experiences."

visitors. In 2015, both New Zealand and Canada officially recognized animals as sentient beings, and more countries may follow suit.

Can *inorganic beings* like computers and robots get sophisticated enough to develop consciousness? The Turing Test says that, if you were to communicate simultaneously with a computer and human, and are unable to distinguish which is which, then the computer has a mind. At the end, it's what we *think* is real that matters. If a computer *seems* to think and act like a human, we're likely to believe it has consciousness.

Harari argues that **all organisms are algorithms**, including humans, i.e. we use a methodical set of steps to make calculations, solve problems and reach decisions. Our brains make rapid decisions daily, using *complex algorithms* that combine an analysis of our surroundings, past experiences, motives etc. That's how you assess if you can dash across the road before an oncoming car reaches you, how a rabbit decides if it's better to dash across a field or try to hide from a nearby fox.

Many of these algorithms are woven into our **genetic makeup** from millions of years of evolution. For example, mammals are built to care for their offspring, and their young intuitively suckle and bond with the adults. Human children who grow up in loving, secure families are more likely to become confident and secure adults. Baby monkeys separated from their mothers became attached to soft, fluffy objects like dolls/blankets, and those without affection grew up to be dysfunctional adults.

Theism gave humans justifications for domesticating other animals. However, it doesn't change the fact that animals have **social, emotional and primal instincts**, just like us.

- For example, wild boars are intelligent, social mammals that need to play and mingle as a group. Their descendants, domesticated pigs, are also smart with *emotional/social needs*. Yet, sows in industrial farms often live their entire lives being locked in tiny crates; each time they give birth, they're separated from their piglets in just 2-4 weeks (a fraction of the natural 10-20 weeks' nursing cycle).

- Humans may be more intelligent and powerful than other animals, but does that *justify* how we treat them? If a

KEY QUOTES

"It won't matter whether computers will actually be conscious or not. It will matter only what people think about it."

"The Agricultural Revolution gave humans the power to ensure the survival and reproduction of domesticated animals while ignoring their subjective needs."

"What makes the fate of domesticated farm animals particularly harsh is not just the way they die, but above all the way they live."

superior species Homo Deus were to emerge, will they treat Homo Sapiens the same way?

If humans are algorithms, don't have eternal souls nor special consciousness, then how did we conquer the world? Harari argues that we became the dominant species because of our unique **ability to organize ourselves** flexibly and in large numbers.

Homo Sapiens: Giving Meaning to the World

Our ability to **imagine, create stories and meaning** allows us to organize ourselves unlike other species.

- Bees and ants work well in large numbers, but they can't change the structure of their colonies easily. Other animals like elephants and chimpanzees can cooperate flexibly, but only in small groups. Humans have the unique ability to *cooperate flexibly and in large numbers*, because we're the only species that can create meaning, invent and spread stories.

- Human communities can *create norms and shared beliefs*, e.g. "if you sacrifice 10 goats, you'll get a good harvest", or "if you kill someone, you'll go to hell". Since people treat the beliefs as reality, we can predict how strangers will behave, and organize people on a large scale, to create legal systems, stock-markets, global trade, etc.

Same algorithm, different stories. Human stories change, but the algorithms behind how societies are organized remain the same.

- Our *social algorithm* goes like this: Decisions are made by a network of people, fronted by a figurehead, and carried out in the name of a bigger idea that gives meaning to the masses.

- However, the *story* behind the algorithm changes, e.g. ancient Egyptians believed in Pharaohs and Gods, while modern people believe in brands like Google. Yet, 12,000 years ago, Gods functioned like big corporations—they owned land, paid salaries and built infrastructure. People prayed to the Pharaoh to alleviate floods, but the real solutions came from coordinated efforts by temple priests

KEY QUOTES

"To the best of our knowledge, only Sapiens can cooperate in very flexible ways with countless numbers of strangers."

"All large-scale human cooperation is ultimately based on our belief in imagined orders."

"If we want to understand our future...we must also decipher the fictions that give meaning to the world."

"No other animal can stand up to us, not because they lack a soul or mind, but because they lack the necessary imagination."

"Fictions enable us to cooperate better. The price we pay is that these same fictions also determine the goals of our cooperation."

and the masses, to build dams and canals. In many ways, the Pharaoh was no more than a powerful brand.

- What matters to people in one era can become *useless* in another. Zeus and Hera were all-powerful in the past, but just myths today. Likewise, our modern-day ideas of human rights and democracy may seem strange to people a few centuries later.

Written language is powerful; it seems more real, can spread knowledge, shape reality and misrepresent truths. In fact, when text and reality clashes, reality sometimes loses.

- For example, in the late 19th century, European powers divided up the African territories, but the borders drawn on paper didn't reflect the realities in Africa. When the discrepancies were discovered years later, the authorities decided to stick to the paper agreement, which became the new reality.

- Computer algorithms will make it even harder to differentiate fiction from reality, and amplify the impact of stories at an increasing pace.

Human societies are held together by **a web of meaning.**

- There are *2 types of reality*. An objective reality affects everyone, whether they believe it or not, e.g. the law of gravity. A subjective reality depends on personal beliefs and feelings, e.g. our beliefs about God or money.

- Our shared stories are reinforced in a *self-perpetuating web*, e.g. what it means get married in a church, or vote in an election. The more people believe them, the more they're practiced and the beliefs are reinforced.

- You can set up a system for any goal (e.g. equality, preservation of life, making money), and create *stories and criteria* to justify how well it's doing. For example, a school with higher average marks is considered a better school, even if marks may not reflect the quality of education.

Science vs Religion. Science and religion do not clash; instead, they complement each other.

KEY QUOTES

"History isn't a single narrative, but thousands of alternative narratives. Whenever we choose to tell one, we are also choosing to silence others."

"Written language may have been conceived as a modest way of describing reality, but it gradually became a powerful way to reshape reality."

"Stories are just tools. They should not become our goals or our yardsticks."

"We want to believe that our lives have some objective meaning... Yet in truth the lives of most people have meaning only within the network of stories they tell one another."

"Instead of changing their stories to fit reality, (bureaucracies) can change reality to fit their stories."

- *Science* gives us *power*, using fact-based solutions to produce food, cure diseases, and fight wars. However, it can't make ethical judgments to tell us *how* to act.

- *Religions* are basically rules that're attributed to a wider moral law, and may not necessarily relate to Gods. They provide *order*, by offering ethical values, subjective goals, and guidelines on what we should do. Most *religious stories* have 3 parts: (a) ethical judgements e.g. "human life is sacred", (b) factual statements e.g. "human life starts at the point of conception", and (c) a merger of the 2 parts to form practical guidelines e.g. "you must not allow abortion once you've conceived".

  While science can't make ethical judgements, it can *validate* if religious facts are accurate. For example, many Christians and Jews believe that the book of Leviticus was dictated by God to Moses, and no word was added/deleted since. However, scientific studies suggest that the Bible is a collection of texts by different human authors, written years after the events described, and compiled into a holy bible long after biblical times.

  - Science and religion can and should *co-exist*. Harari argues that to stay relevant, religions must understand modern technology, so they can guide people on real-world issues, like: What can we do when artificial intelligence replaces our jobs? Where do we draw the line for gene enhancements and life extensions? Traditional religions that fail to do so may well fade into oblivion.

With the power to create meaning and scientific solutions, humans can choose to do anything. The purpose we serve, the stories we choose, and our ability to separate fact from fiction, will shape our collective social, political and economic outcomes.

Part 2: Where are Humans Headed as a Species?

In the book, Harari touches on various developments and perspectives that are shaping our future, and the dilemmas that they bring.

KEY QUOTES

"Religion is created by humans rather than gods, and it is defined by its social function rather than by the existence of deities."

"Religion is any all-encompassing story that confers superhuman legitimacy on human laws, norms and values."

Capitalism and Growth

Capitalism has brought mankind amazing growth, progress, power and control. However, we're now faced with a dilemma: continuing our growth will likely lead to a total ecological collapse, but stopping the wheel of growth can crash our global systems.

Credit is a key building block of our modern economy. It's given in faith that someone will deliver better results in future, and return the credit with interest. Farmers take loans to buy new seeds and fields, people invest their money in stocks, etc. As new ventures succeed, people have even more faith in the future, credits become more accessible and our economy grows.

Capitalism assumes the wheel of growth will spin constantly and indefinitely. Yet, can the ecology support our rapid growth? Although science has constantly delivered new sources of energy, raw materials, and improved production methods, we face a real threat of total **ecological collapse**, which could wipe out all our systems, and even mankind itself.

- We're stuck in a *catch-22 situation*: we want faster progress and growth, yet we must slow down to avoid an ecological collapse.

- Since the rich want more money, and the poor are the first to suffer in an economic slump, *growth continues to trump ecology*. Beijing's air pollution now supports a growing air-purification market; the rich buy air-purifiers and build protective structures over their buildings, while air quality worsens. For all our talk of global warming, greenhouse gas emissions continued to grow at 2.2% annually from 2000-2010. The USA (the top global polluter) refused to ratify the 1997 Kyoto protocol for emissions reduction.

The Humanist Revolution

Humanism is the dominant religion today—it places humans at the centre of the universe, and judges if something is good or bad based on the impact on us. We no longer depend on the Gods and religious scriptures to tell us what's good or right. Instead, we believe in our free will, and depend on our inner feelings and desires to guide our

KEY QUOTES

"Credit is the economic manifestation of trust."

"An ecological meltdown will cause economic ruin, political turmoil, a fall in human standards of living, and might threaten the very existence of human civilisation."

"We talk a lot about global warming, but in practice humankind is unwilling to make the serious economic, social or political sacrifices necessary to stop this catastrophe."

decisions. Even those who believe in God choose to do so, because their inner voice tells them God exists.

There are **3 main sub-branches** to Humanism.

- *Socialist Humanism* advocates having strong collective institutions (e.g. unions) to consider the overall impact on our societies/world.

- *Evolutionary Humanism* advocates leaving things to natural selection—let the superior Homo sapiens win, so mankind gets stronger as a species.

- *Liberalism* advocates that every human being should be free to express his/her unique inner voice. As of 2016, Liberalism is in the lead, manifested in the ideologies of human rights, individualism, democracy and the free market.

However, Liberalism is built on **2 key ideas**, both of which are myths:

- It assumes humans have *free will* and thus should have free choice. But in reality, we can't control our thoughts/ feelings. Our brains' electro-chemical impulses can also be manipulated, and such interventions are already being used in medical treatments and performance enhancements.

- It assumes we are holistic beings with a *single mind*. The truth is, we are full of inner conflicts and can literally be of many minds. Kahneman found that we have 2 selves: an *experiencing self* (which feels our full experiences) and a *remembering self* (which recalls only parts of our experiences, mixes them with other memories or impressions, and develops stories about them). Our decisions are made by the remembering self.

Harari believes Liberalism will die, and humans will lose our value as unique individuals, with **3 possible developments:**

- As computers become more intelligent, *humans lose our value altogether*. Google's self-driving cars are already a reality. Robots, 3D printers and automations have replaced manual workers, and are slowly replacing service jobs. IBMS' AI system, Watson, can even diagnose diseases faster and more effectively than humans. While AI algorithms are

KEY QUOTES

"In 2016 the world is dominated by the liberal package of individualism, human rights, democracy and the free market."

"If organisms indeed lack free will, it implies that we can manipulate and even control their desires using drugs, genetic engineering or direct brain stimulation."

"If I had more than one authentic voice, how would I know which voice to heed?"

"When mindless algorithms are able to teach, diagnose and design better than humans, what will we do?"

still flawed, these are technical issues which can be fixed. Since organisms are algorithms, and it doesn't matter what material the algorithmic calculator is made of, it's possible for non-organic algorithms to someday replicate or surpass humans.

- We *no longer assert our individualism* but stay relevant as a collective species. We're already depending more and more on external algorithms (e.g. wearable technology, mobile apps) to make our decisions, including travel routes, purchases, customizing our diet plans or medication dosage. The more data/access we give to these algorithms, the more accurate their predictions, until one day they can know us better than we know ourselves. Once that happens, we're likely to leave our decisions to the algorithms, rather than look inward to our "true selves". The algorithms may even manipulate how we feel and think, while retaining our illusion of free will.

- A small group of *elite, upgraded superhumans* may emerge to dominate other humans using technology and computer algorithms. The overall level of healthcare, productivity etc. will probably become better, but the gap between the elites and masses will be significantly widened.

KEY QUOTES

"The same technologies that can upgrade humans into gods might also make humans irrelevant."

"Humans will no longer be autonomous entities... Reality will be a mesh of biochemical and electronic algorithms, without clear borders, and without individual hubs."

The New Human Agenda

Besides our need for never-ending growth, humans also have ambitions for immortality (eternal youth) and lasting happiness.

"As long as people die of something, we will strive to overcome it."

Eternal youth. In the past, people accept death as part of our spiritual metaphysical experience. Today, life is increasingly seen as a fundamental human right. We seek *medical solutions* for everything from cancer to Alzheimer's, and find ways to *reduce deaths* from crime, accidents etc. Even Google Ventures is investing in life sciences and *life-extension*.

Happiness is now also seen as a basic human right, and people demand the freedom to pursue their bliss. Yet, finding true happiness isn't easy. On a *psychological level*, rising expectations make it hard for people to feel content. On a *biological level*, we can induce positive feelings by manipulating our biochemical system (using drugs, alcohol, mental stimulants, etc.). However, these effects don't last, and

"If science is right and our happiness is determined by our biochemistry system, then the only way to ensure lasting contentment is by rigging this system."

we're likely to seek new ways to tweak our biology to make the pleasurable effects more permanent.

A New World of Homo Deus and Techno-Religions

As Liberalism gets ousted, and humans push for ever more growth and biological upgrades, new techno-religions could emerge:

Techno-humanism still recognizes humanity at the apex of creation, but uses technology to create the superior Homo Deus with eternal youth and happiness. This may be done through:

- *Biological engineering*, e.g. rewriting our genetic codes, rewiring our brains, or growing new body parts.
- *Cyborg engineering*, to merge our organic bodies with non-organic devices, e.g. bionic hands or artificial eyes.
- *Creation of non-organic beings*, with minds that're so different, we can't fathom how they'll work, just like how our cavemen ancestors couldn't imagine stock markets or smart phones.

In the process of upgrading our bodies and brains, we may end up with a new species of superhumans with an entirely different mind.

Data religion: Dataism is about using computer algorithms to turn massive amounts of information into knowledge and wisdom.

- By tracking what people search online, Google can already detect new epidemics faster than health organizations. Imagine if we could capture the algorithms of organisms and entire ecologies (e.g. beehives, human cities, and forests) and input all the data into a central-processing system. What new outcomes, systems and structures will this give birth to?
- Homo sapiens may be better than other animals in absorbing and using algorithms, but we're likely to be obsolete in the world of Dataism. Yet, the more data is connected, the more

KEY QUOTES

"In pursuit of health, happiness and power, humans will gradually change first one of their features and then another, and another, until they will no longer be human."

"Technological progress has a very different agenda. It doesn't want to listen to our inner voices. It wants to control them."

"As the global dataprocessing system becomes all-knowing, and all-powerful, so connecting to the system becomes the source of all meaning."

we can't resist plugging into the system, further accelerating the trend.

Where do we go from here?

Most of Harari's ideas above are not prophecies, but a projection of our possible futures, based on lessons from our own history. Our choices today are what will define our future outcomes.

The paradox of knowledge. In the 19th century, Karl Marx predicted the collapse of capitalism. His diagnosis sparked awareness and changes over the years, contributing to an opposite outcome to his prediction. By sharing the possible futures of mankind, Harari hopes to shape our knowledge, understanding, choices and actions, so we can collectively change the future.

Nonetheless, **reversing these trends** will not be easy, because:

- Everything is *interconnected*, and there's no single brake to pull.
- There's *no clear line* between "good" vs "bad", healing vs upgrading. For example, Viagra started out as a treatment for blood pressure, and plastic surgery emerged after World War I to treat facial injuries.
- We face *real dilemmas* e.g. the need for growth vs ecological preservation, our desire for technological advancements vs the concern of losing control.
- In our quest for power/control, we've given up the wider meaning/ purpose that held societies together for millennia. What should be the *new higher purpose* that guides our collective choices today, and can we rally ourselves around a common goal?

There are no easy answers to these issues. Harari hopes that this book will spark discussion and debate to make us more conscious of the technologies we use and the choices we make, before the future becomes inevitable.

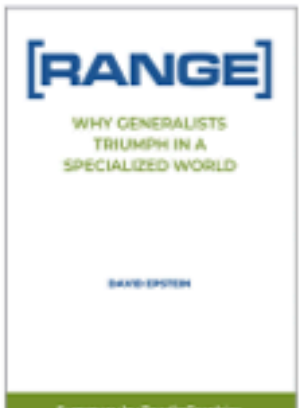
KEY QUOTES

"This prediction is less of a prophecy and more a way of discussing our present choices."

"Since no one understands the system any more, no one can stop it."

"Healing is the initial justification for every upgrade."

"To attain real happiness, humans need to slow down the pursuit of pleasant sensations, not accelerate it."



RANGE

Why Generalists Triumph in a Specialized World

DAVID EPSTEIN

The Big "So What"

In this book, Epstein challenges conventional wisdom that success is best achieved through hyperspecialization, and children should be nurtured in a specific field as early as possible to give them a head-start. He uses stories and research studies to show why/how "range" can be equally (if not more) critical for long-term success in a complex world.

Introduction

The book opens with the stories of 2 sports superstars—Tiger Woods and Roger Federer—who represent specialization vs range.

- *Tiger Woods'* father saw him as a golf prodigy. He began training Tiger at the young age of 2, and devoted his life to nurturing his son into a golf superstar. Tiger is the perfect example of specialization—selecting a path early and accumulating hours of targeted training to become outstanding in an area.

- *Roger Federer* became a tennis legend even though he started much later. When he was young, he tried all sorts of sports, e.g. skiing, swimming, wrestling, skateboarding, basketball, badminton, soccer, etc. He was talented in tennis, but only chose to focus on the sport when he was 12 years old.

- Epstein argues that Roger's *circuitous path* to success is common but less publicized. There're many other sports icons who tried different sports before settling on one (e.g. Tom Brady, Nick Foles) and some even mastered

KEY QUOTES

"In the wicked world, with ill-defined challenges and few rigid rules, range can be a life hack."

"Tiger has come to symbolize the idea that the quantity of deliberate practice determines success—and its corollary, that the practice must start as early as possible."

multiple sports (e.g. Ester Ledecká who won gold for skiing *and* snowboarding at the same Olympics).

Specialization vs range. We're often told that high achievers stick to one career path and persist till they succeed. We frown upon those who keep changing jobs.

- *Hyperspecialization* is about focusing on 1 area and using deliberate practice to hone your skills. It suggests that there's a linear path from A to B, and the earlier you train in a specific domain, the higher your chances of success.

- Epstein argues that specialization is overrated. Instead, he makes the case for "*range*": to accumulate diverse skills/ experiences that culminate in a late specialization that fits with your unique strengths and preferences. People who pursue this path tend to go through a relatively unstructured "sampling period" where they try different things, develop various skills and learn about themselves.

- He suggests that *both specialization and range are essential* for progress and fulfillment. In fact, range can be even more valuable when we encounter complex, unprecedented problems.

- The book is organized into 12 key chapters. Epstein doesn't directly state the takeaways, but uses stories and examples to broadly suggest why/how wide-sampling and late-specialization work. In this summary, we've distilled the main ideas and examples into *12 sections/themes* below.

KEY QUOTES

"Mental meandering and personal experimentation are sources of power, and head starts are overrated."

"We know that early sampling is key, as is diversity."
—Ross Tucker

The Case for Developing Range

Head-starts are overrated

There're many stories of iconic figures who had a head-start since young, e.g. Mozart with music, Mark Zuckerberg with computers. Laszlo Polgar also took the world by storm when he "experimented" with his 3 daughters and successfully trained/home-schooled them to become champion chess players.

- Stories like Polgar's and Tiger Woods' advocate that you *start as early as possible* and use deliberate practice to develop your skills. However, chess and golf are *not* representative of all critical skills/domains in life.

- Psychologists Gary Klein and Daniel Kahneman independently studied the relationship between experience and expertise. They found that *experience didn't always lead to expertise*, especially where human behavior and patterns weren't clearly repetitive.

The key lies in the *nature* of the environments/challenges. Psychologist Robin Hogarth calls these **kind vs wicked learning environments**.

- *Kind learning environments* refer to situations where (i) patterns are repeated regularly, and (ii) feedback is both immediate and accurate. Certain games, music and sports (including golf and chess) occur in kind learning environments: they have clearly-defined rules/boundaries, and observable cause-effect outcomes that allow learners to improve through repetition.

- *Wicked learning environments* refer to situations where (i) the rules of game are unclear/incomplete, (ii) there may or may not be repetitive/obvious patterns, and (iii) feedback tends to be delayed and/or inaccurate. In wicked environments (e.g. financial markets), past patterns don't predict the future and experience may teach you the wrong lessons.

- Experts are strong in their domain because they've learned to recognize patterns in split seconds. Those advantages disappear if they're placed in a new environment, or if there's a *change in status quo*. For example, an elite footballer may appear to have superhuman reflexes because he recognizes patterns in ball/body movements to help him to anticipate what'll happen. This reflex disappears when he plays a new/unfamiliar sport.

In wicked environments, **narrow specialization can even become a disadvantage**.

- Experts may get so used to certain approaches that they *stick rigidly* to them even when the "proven" methods no longer work.

KEY QUOTES

"Whether or not experience inevitably led to expertise... depended entirely on the domain in question."

"Kind learning environment experts choose a strategy and then evaluate; experts in less repetitive environments evaluate and then choose."

"As complexity increases... we also need more people... with range."

- It's also easier to replicate a narrow specialization than broad know-how. So far, *artificial intelligence (AI)* has been able to trump humans in narrow, tactical areas with clearly-defined parameters. For example, machines have already beaten human experts in chess—which is orderly, rule-bound and mainly tactical. However, in undefined, open-ended scenarios with imperfect data and a lack of clear rules (e.g. a game of warcraft), humans still have an edge due to our ability to think strategically and integrate information creatively.

In short, for every person who succeeds with a head-start, you can find a late-bloomer who succeeds without it. Balance the need for specialist knowledge with the risk of rigid thinking:

- *Vary the challenges* within your domain. Don't assume that old patterns will remain the same.

- Broaden your perspective by keeping 1 foot *outside your domain* at all times. Draw on outside experiences and analogies, and deliberately apply the knowledge from one domain to another.

Complexity in the modern world

Professor James Flynn found that our average IQ scores have increased by 3 points every decade in the 20th century, with improvements mainly in the areas of **abstract thinking, problem solving and reasoning**. This was supported by other studies:

- Psychologist Alexander Luria found that people in modern societies *think differently* from those in pre-modern villages. For example, the villagers could only grasp tangible concepts that related directly to their daily activities. When they were presented with a hammer, a saw, a hatchet, and a log, they couldn't see how the first 3 items could be "tools" since they were useless without the log. They also couldn't see how 4 dotted lines could form a square.

- People in post-industrialization societies are much more flexible in our thinking and can use layers of *abstract*

KEY QUOTES

"Our greatest strength is the exact opposite of narrow specialization. It is the ability to integrate broadly."

"The challenge we all face is how to maintain the benefits of breadth, diverse experience, interdisciplinary thinking, and delayed concentration in a world that increasingly incentivizes, even demands hyperspecialization."

"[Premodern villagers] were perfectly capable of learning from experience, but failed at learning without experience."

"Great rewards will accrue to those who can take conceptual knowledge from one problem or domain and apply it in an entirely new one."

concepts and categories to develop complex models. The word "percent" was barely found in books in 1900, but appeared once in every 5000 words by the year 2000. Computer software and digital devices are all built on abstract concepts and symbols.

- Increasingly, standard and repetitive problems will be automated and solved by machines. On the other hand, complex problems will require the ability to *think fluently across domains*.

To solve complex problems in the modern world, you need (i) a range of tools and experience, as well as (ii) the ability to think critically and integrate ideas across domains. Learn ***how*** to think, not just *what* to think.

KEY QUOTES

"Everyone needs habits of mind that allow them to dance across disciplines."

Wide-sampling for learning and creativity

High-achievers don't succeed overnight. They, too, have to go through phases of learning and discovery.

- The *figlie del coro* was a group of female musicians in Venice known for their musical versatility. The best of them (e.g. Anna Maria della Pietà) became celebrities across Europe. Figlie were actually orphans taken in by the orphanage Ospediale della Pieta. They spent the bulk of their time on chores and regular work. However, during their formal music lessons (3x a week) and music study (1 hour a day), they learned to sing and play *every* instrument in the institution. This ability to play multiple instruments was core to their musical skills and versatility. When famous musician Pelegrina della Pietà lost her teeth in her sixties, she had to give up the oboe but could continue to perform on the violin.

- Many paths to music excellence actually start with a *sampling period* where the student has lightly-structured lessons and is exposed to a range of activities/ instruments. Focused, highly-structured, intense practice comes later. In fact, the most accomplished students typically play at least 3 instruments. For example, famous cellist Yo-Yo Ma moved from the violin to the piano before settling on the cello.

"The sampling period is not incidental to the development of great performers...it is integral."

When skills are learned/applied across a range of contexts, it develops abstract mental models that learners can apply in new situations. *That* is the root of creativity.

- Jazz music is much less structured than classical music. A classical piece may be perfected through practice (by repeatedly identifying and correcting errors), whereas jazz music requires *improvisation and creativity*. That's why it's generally easier for a jazz musician to learn classical music than vice versa. The improvisation process is similar to how babies learn to talk—they pick up the sounds *before* learning about grammatical rules.

- Django Reinhardt learned music from observation and *trial-and-error*. At 18, he was injured in an accident and had to try new ways to play without using his left pinkie and ring finger. This sparked a burst of creativity. Reinhardt never learned to read music, yet he could compose an entire symphony by playing each instrument part on his guitar for another musician to transcribe.

KEY QUOTES

"The more context in which something is learned, the more the learner creates abstract models, and the less they rely on any particular example."

"Improv masters learn like babies: dive in and imitate and improvise first, learn the formal rules later."
—Jack Cecchini

Fast vs slow learning

Parents and teachers are often overly-focused on instant results. In reality, the most effective learning strategies are slow and effortful.

- In pedagogy, there are *2 key types of questions*:

  (i) Procedural questions that help students to practice something they've learned, e.g. applying a formula to different math problems.

  (ii) Connection questions that help students to grasp a broader concept, e.g. why a formula works in different situations.

- In both cases, the students must *figure out the answers* on their own for the insights to "stick". When teachers offer hints, they actually hinder the students' ability to learn deeply.

"What you want is to make it easy to make it hard."
—Nate Kornell

"Frustration is not a sign you are not learning, but ease is."

Specifically, learning strategies that create "desirable difficulties" have been proven to enhance long-term learning:

- *Interleaving* is about mixing up the topics instead of studying them sequentially in blocks. For example, instead of repeatedly studying 1 artist's works, it's better to intermix works from several artists. This helps you to discern their differences, so you can learn to match the right strategies to different problems.

- *Spacing (or distributed practice)* is about splitting your practice into a few sessions instead of cramming everything into 1 session. It's harder to recall something when you return to it after some time, which is precisely why it's more effective for encoding the information into your long-term memory.

- The *generation effect* is about testing yourself and generating answers on your own (even if they're wrong). The most effective learning happens when an answer you're confident about turns out to be wrong.

In short, learning that's challenging, slow and frustrating in the short-term tends to yield better results in the long-term. On the other hand, short-cuts that boost immediate performance (e.g. hints, cramming) tend to undermine long-term results.

Handling never-seen-before situations

Deep analogical thinking is about identifying conceptual similarities across seemingly-different situations. This helps us to think through and understand a problem that we have no experience with.

- *Johannes Kepler's* Laws of Planetary Motion gave birth to modern astrophysics. At that point, gravity hadn't been discovered yet, and it was still widely-believed that the universe's planets moved at a constant speed around Earth. Each time he got stuck, Kepler used analogies to consider a new perspective. For example, he likened planets to "moving souls", imagined how "light-like forces" could cause planetary motion, and how planets could attract/repel one another like "magnets".

KEY QUOTES

"For knowledge to be flexible, it should be learned under varied conditions."

"Short-term rehearsal gave purely short-term benefits... Repetition, it turned out, was less important than struggle."

"Learning is most efficient in the long run when it is really inefficient in the short run."

"Analogical thinking takes the new and makes it familiar, or takes the familiar and puts it in a new light, and allows humans to reason through problems they have never seen in unfamiliar contexts. It also allows us to understand that which we cannot see at all."

"In a wicked world, relying upon experience from a single domain is not only limiting, it can be disastrous."

- The more analogies you consider, the more you're likely to arrive at a creative solution. Try this famous cognitive exercise: *Duckner's radiation problem*.

  - Imagine you're a doctor. Your patient has a tumor that can't be operated upon. You can use a certain ray to destroy the tumor. However, it must be applied at a high level of intensity which will also destroy the healthy tissues that it passes through. What can you do?

  - Most people are stumped by this challenge initially, but can solve it after being given 2 analogies. First, a large army was split into groups so they could take many small roads to converge at the fortress they were attacking. Second, many villagers put out a big fire by simultaneously pouring a bucket of water each into the fire. With these analogies, the solution to the tumor may suddenly seem obvious: use multiple rays of lower intensity to target the tumor from different angles. This will produce a high-enough combined intensity to destroy the tumor without killing the surrounding tissues.

Inside vs outside views. Studies have found that humans make poor judgements when we focus narrowly on details in front of us. The more internal details you have about a scenario (e.g. the physical qualities of a race-horse, or the background/details of a politician running for election), the more likely you'll predict that the scenario will occur. By contrast, when you explore outside views, examine structural similarities between your scenario and other remote scenarios, you make better judgements.

In short, you can use analogical thinking to address new, unfamiliar challenges. Good analogical thinking requires that you (i) refer to multiple examples from different and distant domains, and (ii) look beyond superficial/obvious features to identify the deep structural similarities.

Know when to quit

Late-specialization isn't bad. In fact, it may be vital for match quality—the fit between your work and your abilities/ dispositions.

KEY QUOTES

"A problem well put is half-solved."
—John Dewey

"Successful problem solvers are more able to determine the deep structure of a problem before they proceed to match a strategy to it."

- *Van Gogh* spent the bulk of his life exploring and failing in many areas—as a student, art dealer, bookseller, teacher, preacher and aspiring pastor. At the age of 33, he enrolled in art school, but dropped out and developed his own artistic style. When he passed away at 37, his works were only just starting to be recognized. He became truly famous only after his death. Likewise, other late bloomers (e.g. Gaugin and J.K. Rowling) thrived in spite of (or possibly *because of*) their late start.

- After studying of thousands of college graduates, economist Ofer Malamud found that match quality improved when *students* had more sampling opportunities. English and Welsh students specialized early since they had to apply for a specialized program to enter college. On the other hand, Scottish students could spend their first 2 years studying different fields and continue sampling thereafter. The results showed that: (i) English and Welsh graduates were consistently more likely to leave their career fields compared to their Scottish peers, and (ii) Scottish graduates started out with fewer specialized skills and a lower salary, but quickly caught up.

Having said that, isn't persistence important for career success? Psychologist Angela Duckworth found that grit (a combination of passion and perseverance) was a better predictor of whether cadets would complete the "Beast Barracks"—the West Point's training program—compared to the military's Whole Candidate Score.

- Epstein pointed out that the Army's goal was to nurture career senior officers, not Beast survivors. Unfortunately, about half of West Point graduates were leaving active military service after 5 years (once they were allowed to). West Point professors believed there could be an issue with match quality: high-potential candidates may perform well in the military, but they also had great career options outside the military, and ultimately chose to pursue those options.

- In short, *grit isn't always good*. It may predict whether you complete a course or win a contest, but it can become an obstacle to match quality. Instead of persisting on every task/path, sometimes it's good to quit if you're clearly on the wrong track. Just don't quit as an easy way out.

KEY QUOTES

"Exploration is not just a whimsical luxury of education; it is a central benefit."

"If we treated careers more like dating, nobody would settle down so quickly."

"We fail when we stick with tasks we don't have the guts to quit."
—Seth Godin

"The important trick...is staying attuned to whether switching is simply a failure of perseverance, or astute recognition that better matches are available."

Experiment to discover your possible selves

We're often told that we should have a clear vision for the future, then work backwards to develop a plan. For career successes, a short-term, trial-and-error approach may work better.

- Frances Hesselbein (former CEO of the US' Girl Scouts, then CEO of Peter Drucker's leadership institute) is one of the most respected CEOs of her time. She didn't have formal business training, but is always open to new ideas/experiences, and constantly seeks to *learn something from each new experience*.

- Hesselbein's journey is not uncommon. The Dark Horse Project found that many successful people had circuitous career paths instead of direct, linear ones. They use *short-term planning* to leverage available opportunities that match who they were *at that time*. They only developed long-term goals after periods of self-discovery.

So, instead of rigidly following a fixed plan, it's better to continually uncover new possibilities by experimenting in different domains. This makes sense because:

- Our traits/characteristics change depending on the *context*. For example, a child can be passive at home but aggressive in school.

- We also *change with age and experience*, even though we can't predict how we'll change. Psychologist Dan Gilbert uses the term "end of history illusion" to describe how humans are able to retrospectively make sense of how we've changed in the past, but are unable to conceive our future changes.

- Professor Herminia Ibarra recommends using real-life experiences to *test and learn* who you are, rather than relying on personality tests and introspection to choose your ideal career.

KEY QUOTES

"First act and then think. We discover the possibilities by doing, by trying new activities, building new networks, finding new role models."
—Herminia Ibarra

"We learn who we are in practice, not in theory."

"The precise person you are now is fleeting, just like all the other people you've been."

"Test-and-learn, not plan-and-implement."
—Herminia Ibarra

Tap on the outsider advantage

Specialists may not always have the best solutions to complex, technical problems. Outsiders can have an advantage, regardless of whether they have any domain knowledge.

- *InnoCentive* is an open-innovation and crowdsourcing platform that posts challenges for the public to solve (usually for a prize). Using this platform, the Alaska-based Oil Spill Recovery Institute found a simple, practical solution for the oil spills that had contaminated Alaska's coasts for almost 20 years. The solution came from John Davis, a chemist who recalled how he used a vibrating rod to keep concrete from solidifying, and proposed a similar solution to whip up the oil spills so they could be removed.

- *Jill Viles* suffered from a genetic disease that led to muscular dystrophy, but doctors couldn't explain why the gene affected her more severely than her family members. Viles researched widely and managed to establish that she had Emery-Dreifuss (with a mutation of the lamin gene). Since Emery-Dreifuss was linked to heart problems, she quickly sought help for her father's irregular heartbeats and ended up saving his life. Several years later, she noticed that sprinter Priscilla Lopes-Schliep had an unusual lack of fat on her limbs, like herself (except Priscilla had much more muscle). She managed to connect with Priscilla and prove her hypothesis that they both had partial lipodystrophy (another rare disease). In fact, Priscilla could've suffered a pancreatitis attack if her condition had not been highlighted. Through her own observations and research, Viles uncovered answers and saved lives in a way specialists couldn't.

We can facilitate discoveries by creating opportunities for specialist information to be made available to outsiders. The latter is in a better position to unlock creative solutions by (i) reframing the problem with a fresh perspective, and (ii) synthesizing the ideas across vastly-different fields.

KEY QUOTES

"Knowledge is a double-edged sword. It allows you to do somethings, but it also makes you blind to other things that you could do."
—Pedro Domingos

"Big innovation most often happens when an outsider who may be far away from the surface of the problem reframes the problem in a way that unlocks the solution."
—Karim Lakhani

Combining breadth and depth

Epstein uses 3 stories to share ideas about creativity.

Nintendo's engineering strategy is largely shaped by Gunpei Yokoi. Yokoi knew he had limited engineering capabilities and couldn't fight head-on with competitors' cutting-edge technology. So, he used "lateral thinking with withered technology", i.e. to re-imagine and combine old technology (that's cheap, widely available and understood) in new and creative ways. For example, screens from common LCD calculators were used to create a portable handheld game which led to the popular Game Boy. In an industry that focuses on specialized know-how, Nintendo succeeds by using existing technology in fresh ways. Yokoi believed that lateral and vertical thinkers are both valuable, and are the strongest when they work together.

One of 3M's top inventors, Andy Ouderkirk, set out to identify the ideal inventor profile. He found 3 types of inventors at 3M. *Specialists* focus on a narrow area (e.g. a specific type of plastics) and tend to have patents only in that area. *Generalists* integrate ideas from different domains and tend to have patents in diverse areas. *Polymaths* are a hybrid between generalists and specialists—they have a broad range and at least 1 area of depth.

- Specialists thrive in problems that're well-defined and well-understood, but generalists and polymaths do better where there's more ambiguity and uncertainty. *Polymaths* are the most likely to win the esteemed Carlton Award.

- To facilitate the *cross-fertilization of ideas*, create opportunities for specialists to develop range. Ouderkirk himself was a chemist, but acquired a breadth of experience when he worked with >100 teams in his first 8 years at 3M.

In a study of what made comic books successful, the researchers found that breadth of experience matters, especially when it resides in 1 individual.

- The creators' *breadth of experience* mattered more than the length of experience, as the former affected the level and quality of innovation.

KEY QUOTES

"Specialization is obvious: keep going straight. Breadth is trickier to grow."

"Seeding the soil for generalists and polymaths who integrate knowledge takes more than money. It takes opportunity."

"A diverse group of specialists cannot fully replace the contributions of broad individuals."

- An *individual creator* with experience in ≥4 genres was more innovative than a team whose members jointly have experience in ≥4 genres. This could be because it's easier for an individual to integrate diverse experiences in his/her head.

Don't be fooled by expertise

In 1984, psychologist and political scientist Philip Tetlock began to collect thousands of predictions by 284 experts. He found that most experts were terrible forecasters, regardless of their specialty, experience, or academic degrees.

- *Expert* forecasts were consistently wrong—both for short-term and long-term forecasts, and across all domains. Events that were declared impossible (or nearly impossible) still happened 15% of the time. Things that were supposed to happen with certainty failed to happen >25% of the time. In fact, the more famous the expert, the more likely they were wrong.

- By contrast, *integrators* who researched and combined the insights from various experts generated better forecasts on most fronts, especially for long-term predictions.

- Tetlock called them "*foxes*" vs "*hedgehogs*". Generally, foxes who knew many things tended to outperform hedgehogs, because the former could combine different viewpoints into their analyses, allowing them to calibrate their predictions more accurately.

Tetlock also identified several characteristics of great forecasters:

- The best forecasters were both (i) *foxy individuals* who were curious about everything and had a wide range, and (ii) *effective collaborators* who actively shared information and discussed predictions. They saw their ideas as hypotheses to be tested—instead of convincing others that they were right, they invited others to prove them wrong, thus accelerating their team's learning.

KEY QUOTES

"Good judges are good belief updaters. If they make a bet and lose, they embrace the logic of a loss just as they would the reinforcement of a win."
—Philip Tetlock

"The foxiest forecasters were impressive alone, but together they exemplified the most lofty ideal of teams: they became more than the sum of their parts. A lot more."

- To improve your forecasting abilities, *don't just focus on internal details* of the event being investigated. Instead, (i) examine distinctly different events with deep structural similarities, and (ii) study failed predictions to learn what went wrong.

Know when to drop familiar tools

The Carter Racing case study is widely used in MBA programs. Teams are told the importance of an upcoming race, and given data (including the ambient temperature) of 7 engine failures that occurred of out 24 races. Although the last 2 races went smoothly after some fixes, the team didn't know if the problem was resolved. They now have a short time to decide whether to proceed with the race.

- In the real-world, we often have to make important decisions under time pressure, with incomplete information. In fact, this case study was designed based on NASA's 1986 Challenger shuttle explosion. A key question was whether ambient temperature affected engine failure. The data for the 7 failures would've suggested that temperature didn't matter, and students invariably made their decision based on this data. If they had asked for additional data for races *without* engine failures, they'd have seen a clear pattern: engine failures had occurred in every race below 65F, meaning a 99.4% chance of engine failure at the present temperature. Rather than focusing only on the data in front of you, you must consider *what vital data may be missing*.

When we're under pressure, we tend to regress to habitual responses (e.g. methods, tools, actions) that we're the most comfortable with. This could lead to disastrous results.

- For example, *firefighters* are so used to their equipment that they won't drop it even when they're fleeing from an out-of-control fire. Bogged down by the heavy gear, many firefighters perish.

- Likewise, every organization has certain *cultural responses* that people default to. In NASA's Challenger tragedy, one of the engineers had argued strongly against the launch.

KEY QUOTES

"[The Carter Racing case study is]...a stark lesson in the danger of reaching conclusions from incomplete data, and the folly of relying only on what is in front of you."

"When you don't have any data, you have to use reason."
—Richard Feynman

Unfortunately, his views were dismissed as he didn't have the quantitative data to back up his claims. The NASA team was so used to thinking quantitatively that they ignored the qualitative evidence.

- To build a more *effective problem-solving culture*, you must become aware of your default/standard practices, then develop forces that'd push you in the opposite direction. This helps to expand your range and make it easier to drop irrelevant habits/tools when you face unfamiliar challenges.

Be a deliberate amateur

Best-practices and guidelines are useful, but don't allow them to restrict you. Epstein argues that the most creative thinkers tend to have a playful streak that allows them to explore freely and transcend conventional boundaries.

- Nobel Prize winner Andre Geim uses "Friday night experiments" to try out *random, crazy ideas*. Most don't amount to anything, but a few sparked ideas that led to serious innovations. For example, his attempt to use Scotch tape to rip thin layers of graphite led to the development of graphene: a material 100,000x thinner than human hair and 200x stronger than steel.

- *Don't be too serious or perfectionistic*. Occasionally allow yourself to slip into "limited sloppiness", e.g. infuse a different style into your work even if it's "improper". Pretend you're a beginner, or intentionally veer off your original path to see what may surface.

- After focusing deeply on a subject/area, take time out to *study other topics*, so you don't become limited to a narrow sphere.

- In reality, we can't predict what type of information will lead to future breakthroughs. Instead of insisting on immediate, concrete applications for every discovery, approach your experiments with a *spirit of discovery and curiosity*.

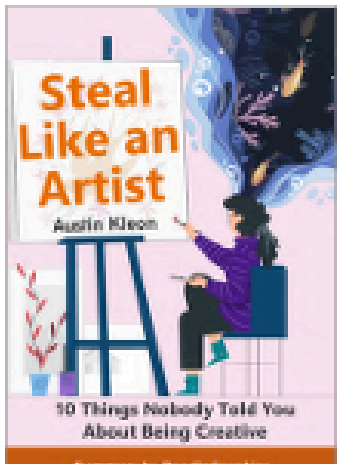
KEY QUOTES

"There are no tools that cannot be dropped, reimagined, or repurposed in order to navigate an unfamiliar challenge…it is, of course, easier said than done. Especially when the tool is the very core of an organization's culture."

"An enthusiastic, even childish, playful streak is a recurring theme in research on creative thinkers."

"Truly original discoveries in science are often triggered by unpredictable and unforeseen small findings."
—Yoshinori Ohsumi

"Be careful not to be too careful or you will unconsciously limit your exploration."
—Max Delbruck



STEAL LIKE AN ARTIST

10 Things Nobody Told You About Being Creative

Austin Kleon

The Big "So What"

How can you ignite your creativity and make your ideas truly shine? This book presents transformative insights to shift your mindset, remix ideas into innovative solutions, discover your authentic voice, and unlock your full creative potential. Whether you're an artist, entrepreneur, or someone seeking fresh inspiration, this book empowers you to thrive with meaningful and authentic creations.

Introduction

In this book, artist and writer Austin Kleon redefines creativity by showing that all great ideas are built upon the foundations of what came before. Creativity isn't about conjuring something from thin air. It's the deliberate process of borrowing ideas, reimagining them, and building upon them to create something truly unique.

Kleon's own work is inspired by icons like Pablo Picasso and T.S. Eliot, who openly embraced the idea of creative borrowing. Kleon combines their wisdom with his practical experiences to present 10 key ideas that empower readers to curate their influences, find their voice, and produce work that feels fresh and authentic.

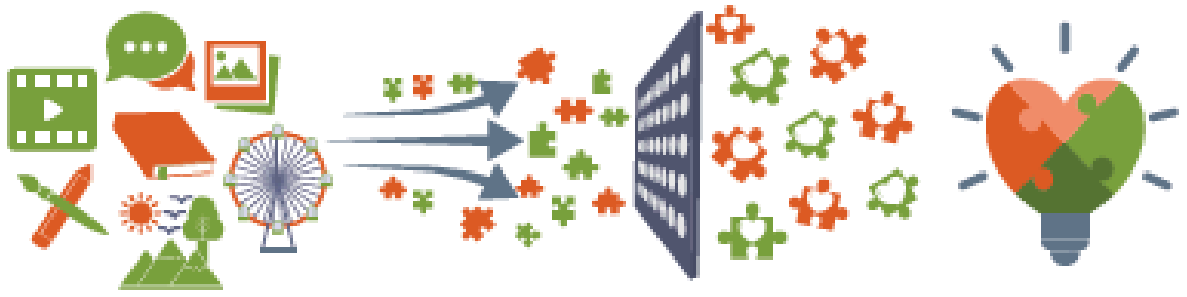
KEY QUOTES

"The only art I'll ever study is stuff that I can steal from."
—David Bowie

"What is originality? Undetected plagiarism."
—William Ralph Inge

10 Big Ideas to Unleash Your Untapped Creative Potential

1. *Curate, then Create*



There's no such thing as a completely "original" idea; every new concept is built on something that already exists. Creativity is about blending existing elements in refreshing or unexpected ways.

- Consider *genetics*: You inherit genes and traits from both your parents, yet you are different from them due to your unique life experiences. Likewise, creativity is about combining inherited ideas with your own perspective to produce something distinctive.

Not all ideas are worth borrowing. True creators master the art of selective stealing.

- Unlike hoarders, who collect indiscriminately and create clutter, real artists are *discerning collectors*. They selectively gather ideas that they love and resonate deeply with, then combine them to create something unique, meaningful, and authentic.

KEY QUOTES

"All creative work builds on what came before. Nothing is completely original."

"Every new idea is just a mashup or a remix of one or more previous ideas."

"Hoarders collect indiscriminately, artists collectselectively. They only collect things that they really love."

- When curating your influences, don't worry about what's "good" or "bad." Just *focus on inspires you* and feels worth stealing.

Here are several practical tips for curating inspiration:

- We become the average of the 5 people we spend the most time with. So, surround yourself with *people, ideas, and objects that uplift and inspire you*.
- Carry a digital or analog notebook with you, and jot down good ideas as you encounter them. Great ideas can come from anywhere—films, books, music, paintings, architectures, nature, or daily conversations. Gather these ideas to create your *personal scrapbook or swipe file* of good ideas and inspirations.
- *Adopt an open, learning mindset*. Read widely, question deeply, and explore the world with wonder and curiosity.
- *Use the internet* to search for virtually any answer or solution.
- *Form your "creative lineage"* by studying the work of artists, writers, and creators you admire. Look for themes or patterns to understand what makes their work interesting and unique.

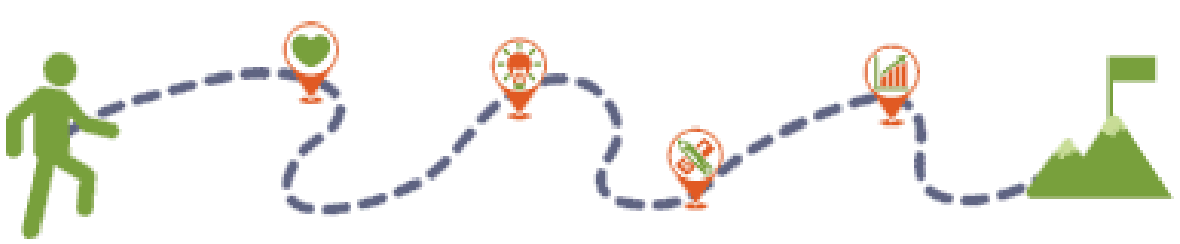
(i) Start with a role model you truly respect. Learn everything you can about them.

(ii) Identify 3 people they admired and learn about them too.

(iii) Keep expanding your "family tree" of creative lineage.

(iv) When you're ready, start your own branch in that tree, by blending their influences into your unique perspective. Return frequently to this lineage as a source of support and inspiration for your work.

2. Start Before You're Ready



Start creating *now*. Don't wait the perfect opportunity or until you feel "ready".

KEY QUOTES

"You're only going to be as good as the stuff you surround yourself with."

"Steal from anywhere that resonates with inspiration or fuels your imagination... Select only things to steal from that speak directly to your soul. If you do this, your work (and theft) will be authentic."
—Jim Jarmusch

"Don't worry about doing research. Just search."

"It is better to take what does not belong to you than to let it lie around neglected."
—Mark Twain

"In my experience, it's in the act of making things and doing our work that we figure out who we are."

- Creativity flourishes through *action, not perfection*. When you first start to create something, you'll have no idea what you are doing. It is by doing that you develop your skills and discover your style.

- It is normal to feel insecure or like a fraud. This is known as the *imposter syndrome*, where you feel like a phony who's just winging it. Just push through it by taking action regardless.

Fake it until you make it. Show up consistently and keep doing the work, even if it feels messy or imperfect.

- Keep creating until you craft something meaningful. *Keep rehearsing* at being the person you aspire to be. Eventually, your actions and reality will align with your vision.

- Everything we know is learned from someone else. Before you can be a master of your craft, you must *first be an apprentice* who studies and emulates others.

Know the difference between good theft (copying) vs bad theft (plagiarism).

- *Good theft* is about reverse-engineering something to uncover how it works. It involves deeply analyzing others' work and successes, then adapting and reshaping the ideas to create something new, while acknowledging and giving credit to those sources.

- *Bad theft* is about claiming others' work as your own, such as superficially mimicking someone's work, undermining its originality, and misrepresenting it as your creation.

There are 2 aspects to copying:

- *Who to copy*: Look to the role models, thinkers, and creators you deeply admire. Learn from multiple sources and integrate their influences to create something different.

- *What to copy*: Go beyond surface-level mimicry. Instead, study the thought processes and worldview behind the work. Seek to understand the principles that shape their style or approach, so you can integrate these insights into your own work.

KEY QUOTES

"You're ready. Start making stuff."

"Your style will emerge over time as you create and develop your skills."

"You have to dress for the job you want, not the job you have, and you have to start doing the work you want to be doing."

"All the world's a stage. Creative work is a kind of theater. The stage is your studio, your desk, or your workstation."

"If you have one person you're influenced by, everyone will say you're the next whoever. But if you rip off a hundred people, everyone will say you're so original!"
— Gary Panter

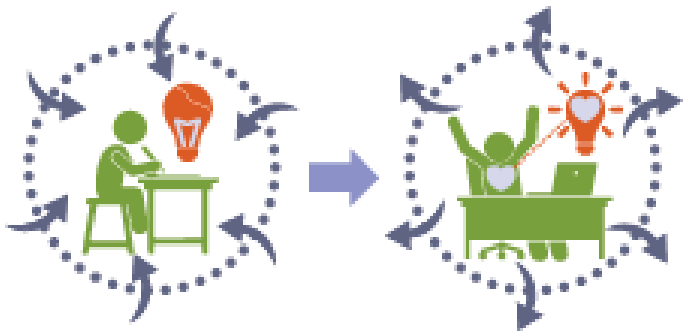
"If you just mimic the surface of somebody's work without understanding where they are coming from, your work will never be anything more than a knockoff."

Find your unique voice by studying the differences between your heroes' work and yours.

- No matter how hard you try, you can never replicate your heroes' work perfectly—and that's a good thing. *Pay attention to the gaps* between their work and yours, then focus on amplifying those differences to nurture your unique style.
- Build on the foundation provided by your heroes, to *create something that's undeniably yours*.

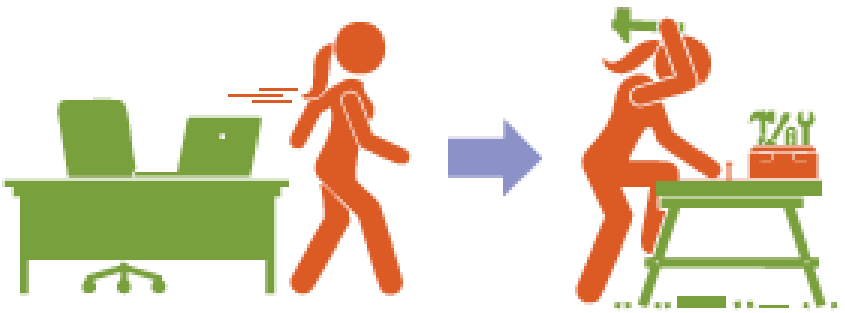
3. Create What You Wish Existed

Don't create what you think you *should* create. Instead, focus on what you love and what excites or inspires you. Create the things you wish existed in the world.



- Instead of writing what you know, channel your passions and desires into *writing what you love and care about*. This ensures your work feels authentic and meaningful.
- Ask yourself: What *would you have loved your heroes to create*—either on their own or as part of a collaboration? Then, go make them yourself.
- If you feel frustrated by the gaps in an area or the lack of options, *fill that void* with your own voice or creation. This is how you contribute your unique skills and perspective to create something both meaningful and impactful.

4. Engage Your Body & Senses



KEY QUOTES

"The best advice is not to write what you know, it's to write what you like. Write the kind of story you like best—write the story you want to read."

"Draw the art you want to see, start the business you want to run, play the music you want to hear, write the books you want to read, build the products you want to use—do the work you want to see done."

Creativity involves the entire body, not just the mind. Great artists, musicians, and leaders engage their entire bodies when they create, perform, or inspire.

- Movement stimulates your senses and sparks creativity. Sitting still at a computer for hours isn't the ideal way to generate ideas. Instead, *step away from the screen* occasionally.

- To get your creative juices flowing, *use your hands* to make or do something tangible. Move sticky notes around, play an instrument, sketch on paper, or work with clay. The physical act of creating activates your mind-body connection, engages your senses, and helps ideas to flow more naturally.

Switch between digital and analog workspaces.

- Kleon suggests *maintaining 2 workstations*:

  (i) An *analog workspace* (e.g. pen, paper, and sticky notes); and

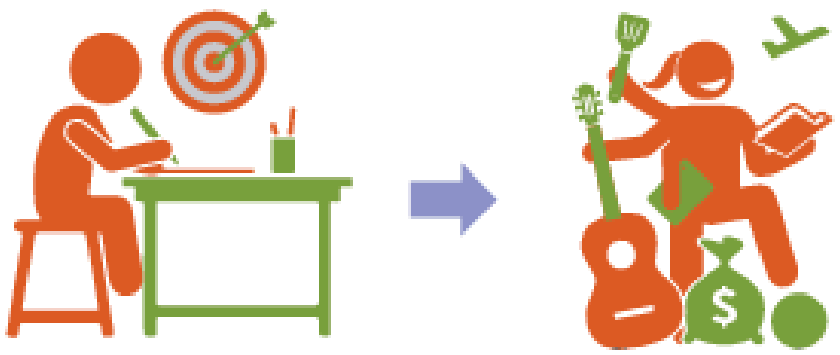
  (ii) A *digital workspace* (e.g. your computer).

- *Toggle between the two* to harness the strengths of each. For example:

  - You could print your work, pin up ideas on a wall, or draft concepts on paper. Then, move to your digital tools to refine and execute those ideas.

  - Use this back-and-forth rhythm to generate ideas offline and polish/publish them online, blending tactile creativity with the efficiency of digital tools.

5. Nurture Your Creative Outlets



KEY QUOTES

"Sitting in front of a computer all day is killing you, and killing your work. We need to move, to feel like we're making something with our bodies, not just our heads."

"Your hands are the original digital devices. Use them."

"Our nerves aren't a one-way street—our bodies can tell our brains as much as our brains tell our bodies."

Explore multiple interests: Hobbies and side projects can offer a valuable outlet for creativity, leading to new ideas and unexpected opportunities.

- Allow yourself to work on *side projects and fun hobbies* outside your main responsibilities. These can spark fresh perspectives, and help you to develop new skills and inspiration from diverse fields that you wouldn't normally dive into.

- *Avoid discarding hobbies or interests* you enjoy, just to force yourself to focus on one thing.

  - These passions are part of who you are. They can also lead to creative breakthroughs by combining diverse skills or ideas.

  - If you feel incomplete after letting go of something—be it music, art, or social groups—make sure you bring them back into your life.

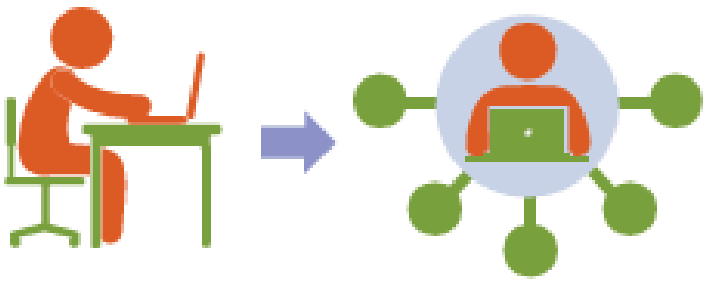
- Dabble in *new ideas, activities, or hobbies*, such as gardening, photography, or sketching. It's ok to mess around and do things just for fun—just go with the flow and see where your curiosity takes you.

Embrace boredom and productive procrastination: Give yourself time to daydream, go for a walk, or engage in mundane tasks like ironing or washing dishes.

- Some of Kleon's best ideas surface during *moments of quiet or boredom*, when the mind is able to wander.

6. Create Great Work, then Share With Others

Use this straightforward yet powerful formula for success: do good work and share it with others.



- *Step 1: Get good first*. Consistency is key. Keep showing up daily to create, experiment, and hone your skills. You'll be lousy at first, but that's normal since progress comes through practice.

KEY QUOTES

"The work you do while you procrastinate is probably the work you should be doing for the rest of your life."
—Jessica Hische

"Take time to mess around. Get lost. Wander. You never know where it's going to lead you."

"It's the side projects that really take off...Stuff that's just play. That's actually the good stuff. That's when the magic happens."

"Avoiding work is the way to focus my mind."
— Maira Kalman

"Creative people need time to just sit around and do nothing."

- Enjoy the initial freedom of obscurity. With no one watching, you can explore, fail, and try again without pressure.

- Explore topics or ideas that fascinate you, especially those that others aren't paying attention to. Let your curiosity and unique interests guide you and set you apart.

- *Step 2: Share your work*: Share your passion, discoveries, and insights with others who share similar interests.

  - In today's digital age, it's easier than ever to share your work online. Sharing opens doors to learning, growth, and collaboration. It may even connect you with future customers.

  - Treat this as a discovery process. Don't just share finished work—also show behind-the-scenes progress, test new ideas and invite feedback.

Tips for sharing your work: You don't have to give away everything you know in order to build a community, gain feedback, or increase visibility/impact. You can:

- *Give small glimpses*: Share snippets of your work, parts of your process, or helpful insights and resources you've found valuable.

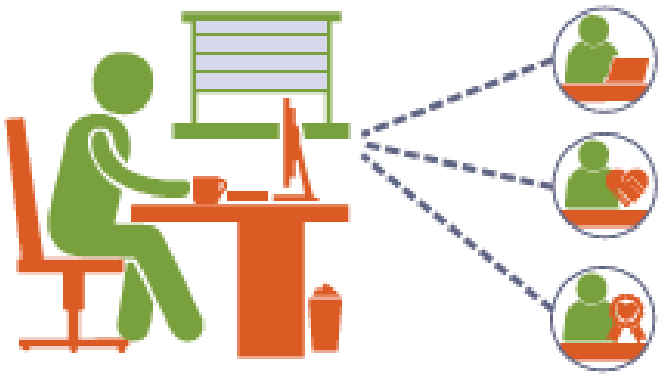
- *Show your journey*: Take your audience behind the scenes to help them understand your work and creative process.

- *Retain some secrets*: You don't have to reveal everything. For instance, you can share core elements of your work without connecting all the dots to reveal the full picture or secret.

7. Connect and Create Anywhere

Today, physical location is no longer a constraint for creative work.

- The internet allows you to *connect globally* with people who share your interests. It's easier than



KEY QUOTES

"Enjoy your obscurity while it lasts. Use it."

"You don't put yourself online only because you have something to say—you can put yourself online to find something to say."

"People love it when you give your secrets away, and sometimes, if you're smart about it, they'll reward you by buying the things you're selling.When you open up your process and invite people in, you learn."

"You can share your dots without connecting them... You have control over what you share and how much you reveal."

"Distance and difference are the secret tonic of creativity. When we get home, home is still the same. But something in our mind has been changed, and that changes everything."
—Jonah Lehrer

ever to exchange ideas, collaborate on projects, and network with diverse, like-minded individuals through online communities or events.

- *Choose an environment* that suits your creative needs, whether it's working from home, a café, or a remote destination.

To create a conducive environment for creative work:

- Embrace *solitude*: Give yourself mental space to think deeply, free from distractions and external noise.
  - Dedicate a quiet workspace and set regular time blocks for interruption-free work.
  - Surround yourself with inspiring materials like books, images or art, while minimizing distractions.
- Use "*temporary captivity*": Restrict yourself to specific environments or situations that facilitate focus, such as a quiet room or a location without Wi-Fi.
  - Use waiting time—like commuting or standing in line—to brainstorm or observe the world for inspiration. Always carry a notebook to jot down ideas.

Kleon recommends leaving home at least once, to immerse yourself in a new environment and step outside your comfort zone.

- Explore *different cultures, practices, and beliefs* to stimulate your mind.
- Make yourself at home in a location where you *thrive physically, mentally, and emotionally*—in terms of surroundings, food, people, and weather that support your creativity.

8. Make Friends, Not Enemies

KEY QUOTES

"All you need is a little space and a little time—a place to work, and some time to do it; a little self-imposed solitude and temporary captivity."

"When you can do it, you have to leave home. You can always come back, but you have to leave at least once."

"You have to find a place that feeds you—creatively, socially, spiritually, and literally."

"Travel makes the world look new, and when the world looks new, our brains work harder."

In today's interconnected world, you should assume that everything you say or do—good or bad—can be seen by others. Kleon's advice is simple: be nice. Say good things about people you like, and ignore your enemies.

- Surround yourself with *talented, inspiring people*:
  - Follow and connect with people who are *smarter and more talented than you*, and whose work genuinely inspires you. Pay attention to what they do, who they connect with, and what they talk about.
  - *Publicly share your appreciation* for their work. Link to their website, solve a problem they're facing, answer a question they posed, or even create something inspired by them. Do this selflessly, without expecting anything in return. Treat any response you get as a bonus, not your main goal.
- *Build meaningful connections* with kindness: Where possible, compliment others, offer help/support, and contribute positively to your communities.
- *Avoid arguments or negativity online*. If you encounter something that upsets you, don't waste time/energy complaining or arguing about it online. Channel your anger and frustrations into your creative work.

Creativity requires a mix of curiosity, persistence, and humility. Focus on self-encouragement, not external validation, and be willing to get uncomfortable or even look foolish.

- *Don't depend on external validation* to motivate yourself. Not everyone will understand or value your work, and recognition (if any) may come much later, sometimes even after your death.
- Ignore criticisms from haters and naysayers, trust your journey, and *immerse yourself in your work* instead.
- Intentionally *celebrate the positives*. Keep a "praise file" of positive feedback, kind words, and compliments from your fans or community. During tough times, revisit these to remind yourself of your impact and keep going.

KEY QUOTES

"There's only one rule I know of: You've got to be kind."
—Kurt Vonnegut

"The best way to vanquish your enemies on the Internet? Ignore them. The best way to make friends on the Internet? Say nice things about them."

"If you ever find that you're the most talented person in the room, you need to find another room."

"Go on, get angry. But keep your mouth shut and go do your work."

"The best way to get approval is to not need it."
— Hugh MacLeod

"Get comfortable with being misunderstood, disparaged, or ignored—the trick is to be too busy doing your work to care."

9. Create Structure for Creative Freedom

When you think of a creative genius, do you think of a bohemian-style, free-spirited individual surrounded by adventure and indulgence? That's a myth. Creative work requires discipline, consistency, and balance.

- Creative success often comes from a *structured, "boring" life* with consistent routines, adequate rest, and self-care. Such a balanced lifestyle provides the required energy and focus for your creative goals.

Build a strong, stable foundation:

- *Manage your finances wisely*. Live within your means and stay out of debt to reduce financial strain.
- *Keep your day job* while you pursue your creative passions.
  - This (i) provides financial security, (ii) adds structure to your day and (iii) creates opportunities to learn from others.
  - Choose a job that pays the bills, doesn't drain your energy, and leaves you with enough time for your creative pursuits.

Devote consistent creative time to sustain the momentum.

- Work out how much time you can free up for creative work, *create a routine, and stick to it*. It's hard to regain momentum once it's broken.
- Try Jerry Seinfeld's *calendar method* to sustain motivation. Break your annual goal into daily chunks, then mark a tick on our calendar for each day you complete your work. As the chain of ticks grows, you will feel more motivated to keep going and maintain the momentum.
- Keep a simple *logbook* to track your journey and what you accomplish each day. Record key activities, creative work, or even small highlights (e.g. a good meal or a meaningful interaction). This reinforces progress and helps you reflect on your growth.

KEY QUOTES

"Be regular and orderly in your life, so that you may be violent and original in your work."
—Gustave Flaubert

"It takes a lot of energy to be creative. You don't have that energy if you waste it on other stuff."

"Freedom from financial stress also means freedom in your art."

"The art of holding on to money is all about saying no to consumer culture."

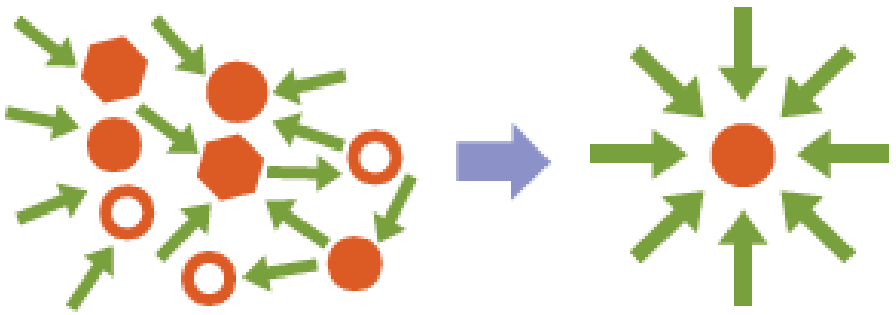
"Inertia is the death of creativity. You have to stay in the groove."

"Get a calendar. Fill the boxes. Don't break the chain."

"Do the work every day, no matter what. No holidays, no sick days. Don't stop."

Find the right partners who support your creative goals and helps you stay grounded and focused. This applies not just in marriage, but also in business and friendship.

10. Simplify to Amplify



Creativity isn't about constantly adding more—it's often about removing what's unnecessary to reveal what truly matters.

- Too many choices or elements can overwhelm and paralyze. By stripping away the non-essentials, you can *focus on the core* of your work, and create something that's more meaningful and impactful.
- In creative work, what you choose to leave out can be as interesting and valuable as what you choose to include. *Thoughtful subtraction* can make your work cleaner, more focused, and more compelling.

Try adding constraints to overcome creative blocks. Simplify and do more with less.

- See constraints not as limitations, but tools to *spark creativity and resourcefulness*. For instance, challenge yourself to:

  (i) Complete a task within a strict time frame (e.g. 1 hour);

  (ii) Create something with only one color or material; or

  (iii) Film a project entirely with your phone.

- Instead of waiting for perfect conditions or ideal resources, *work with what you have*. Start creating and moving forward.

KEY QUOTES

"The small details will help you remember the big details."

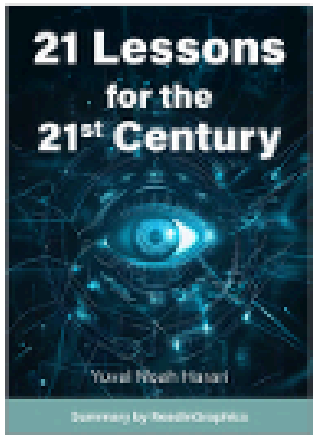
"Relationships are hard enough, but it takes a real champion of a person to be married to someone who's obsessed with a creative pursuit."

"Nothing is more paralyzing than the idea of limitless possibilities. The idea that you can do anything is absolutely terrifying."

"In the end, creativity isn't just the things we choose to put in, it's the things we choose to leave out."

"When it comes to creative work, limitations mean freedom."

"In this age of information abundance and overload, those who get ahead will be the folks who figure out what to leave out, so they can concentrate on what's really important to them."



21 LESSONS FOR THE 21ST CENTURY

Yuval Noah Harari

The Big "So What"

How do we stay relevant in an AI-driven world? Who can we trust in an era of misinformation? Where do we find meaning when old certainties are fading? This book tackles these urgent questions and more, offering insights into the biggest challenges of our time, and helping us to navigate uncertainty with clarity, critical thinking, and resilience.

Introduction: The 21 Lessons for the 21st Century

We live in an age of information overload and rapid change, where most people have little time to reflect on humanity's future. Without understanding these shifts, we risk being left behind—economically, socially, and intellectually. More importantly, our choices today will shape the future in ways we may not yet fully grasp.

This book helps us make sense of this volatile, complex world. It unpacks the most pressing challenges of our time and explores their implications—both for individuals and for humankind as a whole. To navigate the future, we must first understand the present.

- Harari presents *21 key lessons across 5 themes*:

KEY QUOTES

"This book tries to cover different aspects of our global predicament, without claiming to be exhaustive."

"We cannot wait for the crisis to erupt in full force before we start looking for answers."

"In a world deluged by irrelevant information, clarity is power."

"People have debated the meaning of life for thousands of years. We cannot continue this debate indefinitely."

"If you don't know what to do with the power to engineer life, market forces will not wait a thousand years for you to come up with an answer."

Part 1: Navigating Technological Changes

Rapid technological progress has disrupted work and life, reshaping our beliefs, work, and freedoms.

Disillusionment from the End of Old Political Narratives

Liberalism has been the dominant political ideology since World War II, especially after communism collapsed in the late 20th century.

- It is built on the belief that *greater freedom leads to peace and prosperity*, emphasizing:

  (i) Political freedom (democracy and governance by the people);

  (ii) Economic freedom (free markets & capitalism); and

  (iii) Personal freedom (individual rights & choices).

However, **trust in liberalism has eroded**—especially after the 2008 financial crisis—due to rising inequality, economic instability, and technological upheavals. Many no longer believe that more freedom or globalization will solve their problems.

- A *shift away from globalization* is already evident with examples like Brexit (the UK's rejection of EU governance) and "America First" (president Donald Trump's protectionist and nationalist policies that oppose free trade and global cooperation).

- *Technology has further complicated this challenge*:

  - AI, automation, and biotech are reshaping the global economy and threatening millions of jobs.

  - The internet, cryptocurrencies, and financial markets evolve so rapidly that they're incomprehensible to most people—including governments trying to regulate them.

Without a new guiding story to replace liberalism, we risk political chaos, economic instability, and **mass disillusionment**.

KEY QUOTES

"Humankind is losing faith in the liberal story that dominated global politics in recent decades, exactly when the merger of biotech and infotech confronts us with the biggest challenges humankind has ever encountered."

"The liberal story acknowledges that not all is well in the world, and that there are still many hurdles to overcome."

"To have one story is the most reassuring situation of all. Everything is perfectly clear. To be suddenly left without any story is terrifying."

"Humankind is facing unprecedented revolutions, all our old stories are crumbling, and no new story has so far emerged to replace them."

Many who feel left behind are turning to nationalism and religious fundamentalism to fill the ideological vacuum.

Harari argues that liberalism, despite its flaws, is still the best framework for addressing modern challenges. Rather than abandon it, we should adapt and improve it for the new era.

The Future of Work: AI, Automation & Biotech

AI and automation are rapidly reshaping the workplace. In the short term, they may replace repetitive tasks but also create new roles.

- Currently, machines struggle with *tasks requiring emotional intelligence and dexterity*. For example, AI can diagnose diseases, but it can't replicate a nurse's ability to comfort patients, build trust, or handle unpredictable incidents.
- *New roles* are emerging, such as in data analysis, AI maintenance, cybersecurity, and AI-human collaboration (hybrid jobs).
  - Example: In healthcare, AI can diagnose diseases faster than doctors, freeing human experts to focus on research, treatment innovations, and personalized care.

As biotech and infotech merge in the long run, the impact could be more severe:

- AI may *surpass humans* in areas once considered uniquely human—intuition, creativity, and emotional intelligence.
  - *Chess & creativity*: In 2017, AlphaZero (Google's AI) learned chess from scratch in just 4 hours and defeated Stockfish 8, the best human-trained AI. Unlike past chess AIs that relied on brute-force calculations, AlphaZero developed creative, unexpected strategies that stunned even grandmasters.
  - *Art and emotion*: Art was once seen as uniquely human. But biometric AI can analyze facial expressions, heart rate, and brain activity to create music, paintings, or digital art that trigger specific emotional responses. AI doesn't need to surpass history's greatest artists—it just needs to be better than the average human artist to dominate the industry.

KEY QUOTES

"At the end of the day, humankind won't abandon the liberal story, because it doesn't have any alternative."

"It would be madness to block automation in fields such as transport and healthcare just in order to protect human jobs. After all, what we ultimately ought to protect is humans–not jobs."

"The threat of job losses does not result merely from the rise of infotech. It results from the confluence of infotech with biotech."

"In the long run no job will remain absolutely safe from automation."

"We might actually get the worst of both worlds, suffering simultaneously from high unemployment and a shortage of skilled labour."

- New jobs will require *specialized skills* (e.g. drone operators, AI supervisors, cybersecurity analysts), making it harder for low-skilled workers to transition to new jobs.
- Even skilled professionals will have to *constantly reskill*, leading to stress and mental health challenges.
- *AI networks could even replace entire professions*. For example, it takes years to train human doctors or transfer new knowledge. Yet, a network of AI doctors can be instantly updated worldwide.

If AI outpaces job creation, it may create a growing "useless class"—people with no clear role in society, leading to economic and social instability.

Harari argues we should focus on protecting people, not jobs. Instead of fighting automation, focus on financial security and meaningful roles as traditional employment disappears:

- Regulate AI and automation to *slow job displacement* and protect vulnerable workers in key sectors.
- *Create new jobs* by focusing on reskilling and lifelong education, and facilitating career transitions.
- Offer *universal basic income* (UBI) or public services: Tax tech giants and redistribute wealth through monthly stipends or free healthcare, education, and social services. The challenge lies in defining what qualifies as "universal" and "basic."

Loss of Liberty and Privacy in an AI-Driven World

In the age of AI and Big Data, free will may be an illusion.

- Liberalism assumes that *our feelings reflect free will*—that voters should choose their leaders, consumers should choose what to buy, and individuals should pursue happiness based on personal desires.
- However, scientists have found that emotions are the result of electrochemical signals in the brain. If feelings are just biochemical data, then *whoever controls the data controls us*.

KEY QUOTES

"Instead of humans competing with AI, they could focus on servicing and leveraging AI."

"We should compare the abilities of a collection of human individuals to the abilities of an integrated network."

"What we should focus on is providing for people's basic needs and protecting their social status and self-worth."

"The fact that something can be done does not mean it must be done."

"Creating new human jobs might prove easier than retraining humans to actually fill these jobs."

"Feelings aren't based on intuition, inspiration or freedom–they are based on calculation."

With access to biometric data, AI can analyze our emotions, predict our desires, and craft targeted messages to **manipulate our decisions**.

- Companies like Netflix, Amazon, and Facebook already shape our preferences and choices using personal data. If biometric data (e.g. heart rate, blood pressure, and brain activity) is integrated into their systems, they could detect subtle mental-emotional shifts and tailor content to *shape choices with precision*.
- The more accurate and useful AI becomes, the more we rely on it. We already trust Google Search to tell us what's true and Google Maps to tell us where to go. The more we depend on AI, the less we think for ourselves—feeding more data into the system and reinforcing AI's control over our choices in a *vicious cycle*.
- AI-driven governments and corporations could *remove human choice* entirely, assigning roles, careers, or services based solely on algorithmic decisions.
- At the extreme, it could even lead to "*digital dictatorships*" where governments use biometric surveillance to detect dissent and suppress opposition before it even begins.

AI is only as good (or bad) as its **rules and programming**.

- Imagine if an AI car faces a no-win situation: it must either hit a child who suddenly runs onto the road, or swerve into the next lane and collide with another vehicle. What should it do? A human driver would react instinctively, but *an AI must be pre-programmed* to decide who lives and who dies.
- The real question is: *who should program the AI's moral code*—governments, corporations, or individual consumers?

A New Age of Extreme Inequality

In the past, land (agriculture) and machines (industrial revolution) were the foundation of wealth. Today, data is the new power. **Those who control data will shape the future**.

- Today, the richest 1% own half of the world's wealth. AI and Big Data can widen this gap much further.

KEY QUOTES

"Hacking human decision-making will not only make Big Data algorithms more reliable, it will simultaneously make human feelings less reliable."

"Algorithms might gain authority because we will learn from experience to trust them on more and more issues, and will gradually lose our ability to make decisions for ourselves."

"If we are not careful, we will end up with downgraded humans misusing upgraded computers to wreak havoc on themselves and on the world."

"There might be some new openings for philosophers, because their skills–hitherto devoid of much market value –will suddenly be in very high demand."

"Those who own the data own the future."

The ultra-rich could use biotech and AI to create a new elite class of "superhumans", creating an irreversible social-economic divide.

- In the past, wealth bought luxuries and social status. In the future, it may buy *longer life, higher intelligence, and superior physical abilities* via biotech and AI modifications.
- The working class may *not just be exploited, but made irrelevant*.
  - AI and automation may erase entire industries. For example, wealthy nations may replace outsourced labor (in countries like Bangladesh and India) with robotics and 3D printing.
  - If the masses lose economic value, governments might cut public welfare and leave social support to private charities.
  - The power balance may shift toward a global ruling elite of Silicon Valley billionaires, Moscow oligarchs, and Chinese tech tycoons, who manipulate public decisions using AI-driven algorithms, and operate beyond national borders (protected by AI, private security, and mass surveillance).

There's an urgent need for data governance. Yet, data is hard to regulate as it's intangible, easily copied and shared, and controlled by a few tech giants. Harari outlines 3 possible solutions:

- *Government control*: This could curb corporate power but risks creating digital dictatorships.
- *Corporate control*: This encourages innovation but might concentrate too much power in the hands of a few tech giants.
- *Individual or community control*: This promotes data democracy, but it's unclear if it can be feasible at scale.

Part 2: Political Challenges in a Fragmented World

Humanity faces pressing challenges that cannot be solved by a single nation or culture. Yet, our societies are fracturing at a time when we need global cooperation.

KEY QUOTES

"The real problem with robots is not their own artificial intelligence, but rather the natural stupidity and cruelty of their human masters."

"By 2100, the richest 1 per cent might own not merely most of the world's wealth, but also most of the world's beauty, creativity and health.

"Globalisation will unite the world horizontally by erasing national borders, but it will simultaneously divide humanity vertically."

"Maybe one of 'our' biggest problems is that different human groups have completely different futures."

"How do you regulate the ownership of data? This may well be the most important political question of our era."

"Any solution to the technological challenge has to involve global cooperation."

The Fragmentation of Human Communities

People today feel increasingly isolated, lonely, and disconnected due to the decline of traditional, close-knit communities.

- In 2017, Facebook's Mark Zuckerberg proposed *using AI and social networks to build a global community*. However, his vision was quickly overshadowed by scandals revealing that Facebook-harvested data had been misused to manipulate elections.

Despite this, Harari suggests leveraging AI to restructure human connections on a global scale. This is only possible if tech giants to change their business models and address key challenges:

- *Online vs offline connections*: Digital interactions cannot replace deep, offline relationships. For example, if you're sick, getting an online message from a friend isn't the same as a personal visit. Over-reliance on digital connections can intensify loneliness and emotional disconnection.
- Social media creates the *illusion of vast networks*, but research (Dunbar's Number) suggests humans can only maintain meaningful relationships with about 150 people. Beyond this, connections become shallow and fragmented.
- *Self-connection matters*: Social media encourages people to seek external validation over genuine connection. Rather than fully experiencing each moment, people focus on capturing and sharing them for likes. Digital communities won't be effective unless people first reconnect with their own emotions, bodies, and inner selves.

Rethinking Conflict: We are 1 Single Civilization

The "clash of civilizations" theory suggests that the world is divided into distinct civilizations (e.g. Islam vs. the West) and clashes are inevitable due to irreconcilable differences. Some use this theory to justify isolationism.

Harari challenges this view, arguing that all of humanity is part of a single, interconnected civilization.

KEY QUOTES

"Humans have bodies. During the last century technology has been distancing us from our bodies."

"In order to flourish we still need to ground ourselves in intimate communities."

"A community may begin as an online gathering, but in order to truly flourish it will have to strike roots in the offline world too."

"People live ever more lonely lives in an ever more connected planet."

"If you don't feel at home in your body, you will never feel at home in the world."

"People still have different religions and national identities. But when it comes to the practical stuff–how to build a state, an economy, a hospital, or a bomb–almost all of us belong to the same civilisation."

- The real conflict isn't between Islam and the West, but between modern global culture and people who feel alienated by it. Groups like ISIS are products of *modern identity crises, inequality, and political instability*, rather than ancient religious traditions.

- Civilizations are not biologically fixed. *Cultures evolve*, like how Germany has transformed politically multiple times in a century (empire → democracy → Nazi regime → democracy).

- Our conflicts aren't clashes between distinct civilisations, but *internal struggles* in a shared global system—like disagreements within a family.

The real threats of the 21st century—climate change, AI, inequality—transcend national and cultural boundaries. These problems require **global cooperation, not division**.

- The *Olympics* are a great example of successful global cooperation—where different nations (even rivals) come together to compete under common rules.

Balancing Nationalism in a Globalized World

Nationalism—loyalty to one's nation—can foster unity and civic responsibility. However, **ultranationalism can be dangerous**. It's the belief that one's nation is inherently superior and its interests must be prioritized above all else. Historically, it has fueled war, imperialism, and isolationism.

- *Nationalism is not inherent to human nature*. For most of history, people lived in small tribes. National identity only emerged to address large-scale challenges, e.g. ancient Egyptian tribes uniting to build dams and manage flooding.

Humanity's greatest challenges today require **global cooperation, not division**.

- *Problems that transcend borders include*:
  - *Nuclear war*: Modern nuclear weapons mean that large-scale wars can bring global annihilation.
  - *Ecological collapse*: Climate change, deforestation, and pollution endanger the entire planet. However, it impacts nations unevenly, making global cooperation difficult.

KEY QUOTES

"Whatever changes await us in the future, they are likely to involve a fraternal struggle within a single civilisation rather than a clash between alien civilisations."

"Identity is defined by conflicts and dilemmas more than by agreements."

"No group rejecting the principles of global politics has so far gained any lasting control of any significant territory."

"The problem starts when benign patriotism morphs into chauvinistic ultra-nationalism."

"We now have a global ecology, a global economy and a global science–but we are still stuck with only national politics."

"To have effective politics, we must either de-globalise the ecology, the economy and the march of science–or we must globalise our politics."

- *Technological disruption* from biotech and infotech transcend borders cannot be resolved by any single country.

- It's crucial to *balance national pride with global responsibility*, patriotism with global citizenship.

Religion's Role in Modern Society

Traditional religions—like Christianity, Islam, Hinduism—have lost relevance for technical and policy challenges.

- In *technical fields* like agriculture, medicine, and meteorology, people now turn to scientists, doctors, and engineers rather than priests, temples, or shamans.

- Religion also lacks clear solutions for modern *policy issues*. Religious leaders rarely create policy, though they may still influence politics by interpreting scientific and political ideas in religious terms after key decisions are made.

However, religion still plays a major role in shaping identity by defining who belongs to "us" vs "them".

- Although traditional religions teach universal values, they were often exploited to serve group or national interest. This has led to *division rather than unity*, such as conflicts between different faiths (Christians vs Muslims) and within the same religion (Sunni vs Shia, Catholic vs Protestant).

Immigration Challenges & The Rise of Culturism

Globalization has intensified immigration debates, especially in Europe, leading to three key dilemmas:

- *How open should borders be?* Some believe all humans have a moral responsibility toward one another. Others argue that immigration is a privilege, not a right, so countries should control who they accept or reject.

- *How much should immigrants assimilate?* Some say European culture is diverse, so it's unrealistic to expect immigrants to conform to an imaginary "European identity." Others worry

KEY QUOTES

"A person can and should be loyal simultaneously to her family, her neighbourhood, her profession and her nation –why not add humankind and planet Earth to that list?"

"In the twenty-first century religions don't bring rain, they don't cure illnesses, they don't build bombs–but they do get to determine who are 'us' and who are 'them', who we should cure and who we should bomb."

"Traditional religions are largely irrelevant to technical and policy problems. In contrast, they are extremely relevant to identity problems –but in most cases they constitute a major part of the problem rather than a potential solution."

"Though globalisation has greatly reduced cultural differences across the planet, it has simultaneously made it far easier to encounter strangers and become upset by their oddities."

"Cultural relativists argue that difference doesn't imply hierarchy, and we should never prefer one culture over another."

that Europe's liberal principles may be eroded by an influx of immigrants with conflicting values (e.g. homophobia, anti-Semitism).

- *When should immigrants be considered full citizens?* Some say integration should take no more than 3 generations. Others argue assimilation can take centuries—if it happens at all.

After WWII, racial discrimination (based on skin color or genetics) was discredited. However, culturism—a new form of discrimination—has emerged, where some cultures are deemed superior to others.

- Cultural superiority is a *flawed concept* because a practice that works in one society isn't necessarily better everywhere. Moreover, it reinforces harmful stereotypes (e.g. assuming "Muslim culture is intolerant") when cultures are both fluid and diverse. It also leads to unfair biases, e.g. rejecting job candidates due to their cultural background.

If we can't handle cultural differences, how can we solve larger global challenges? The solution lies in finding a middle ground that balances immigration with social and political stability.

Part 3: Choosing Your Beliefs & Narratives Wisely

Our identities and decisions are shaped by narratives—from religions to ideologies, and national myths. Choose stories that bring hope and inspiration, not fear and despair.

Terrorism: A War of Fear, Not Force

In the 21st century, terrorism kills far fewer people than war, disease, or crime. Yet, it wields disproportionate power by using fear as a psychological weapon.

- Terrorists act *like theater producers, not military strategists*. They lack conventional military strength, so they stage dramatic spectacles to capture global attention, spread panic, and destabilize governments.

KEY QUOTES

"Traditional racism is waning, but the world is now full of culturists."

"Humans may think and behave in various ways, but we should celebrate this diversity, and give equal value to all beliefs and practices."

"Humankind can rise to the occasion if we keep our fears under control and be a bit more humble about our views."

"Terrorists are masters of mind control. They kill very few people, but nevertheless manage to terrify billions and shake huge political structures."

- Example: The 9/11 attacks targeted the Twin Towers for their visual and emotional impact. A Pentagon strike would have been militarily significant but far less dramatic.

- The true goal of terrorism is to *provoke an overreaction*. Terrorists are like flies in a porcelain shop—they can't do much damage directly, so they buzz in the ear of a bull nearby, until the bull smashes everything in a blind rage.

  - Governments fall into this trap when they respond with large-scale military invasions or extreme policies that cause more damage than the terrorist acts themselves.

The best counter to terrorism is to **be rational, not reactive**.

- *Governments* should avoid large-scale military responses and focus on intelligence and covert operations.

- *The media* should avoid sensationalism and provide context, instead of amplifying fear.

- *Citizens* must recognize terrorism for what it is, instead of letting their imagination run wild.

While conventional terrorism thrives on fear, future threats—like nuclear, cyber, or bioterrorism—could be catastrophic. Global cooperation is essential to **prevent terrorists from acquiring weapons of mass destruction**.

The Folly of War & The Power of Diplomacy

In the past, war was profitable—conquering armies seized land, wealth, and enslaved populations. Today, **war is more costly and less rewarding**:

- *Wealth* is now based on knowledge and technology, which cannot be seized by force.

- Modern warfare is *unpredictable* due to nuclear weapons and cyberwarfare. Retaliation can come from anywhere with devastating outcomes.

- As a result, *leaders avoid full-scale wars*, relying instead on proxy conflicts, cyberattacks, and military posturing.

KEY QUOTES

"If we allow our imagination to be captured by the terrorists, and then overreact to our own fears–terrorism will succeed. If we free our imagination from the terrorists, and react in a balanced and cool way–terrorism will fail."

"In most cases, [an] overreaction to terrorism poses a far greater threat to our security than the terrorists themselves."

"The theatre of terror cannot succeed without publicity."

"Today the main economic assets consist of technical and institutional knowledge rather than wheat fields, gold mines or even oil fields, and you just cannot conquer knowledge through war."

Yet, peace is not guaranteed because humans often act in self-destructive ways.

- History is full of *poor decisions* that led to unnecessary wars. For example, Japan in the 1930s believed economic survival required controlling Korea, Manchuria, and China's coast. Yet, Japan's greatest economic boom happened *after* losing its empire, proving its WWII efforts were a disastrous miscalculation.
- Global tensions are rising. Military spending is increasing, and a series of poor decisions or misunderstandings could *trigger another world war*.

Prevent war through global cooperation, diplomacy and humility.

- *Avoid 2 dangerous mindsets*:
  - (i) Thinking war is inevitable → Leads to arms races, paranoia, and conflicts that become self-fulfilling prophecies.
  - (ii) Thinking war is impossible → Leads to complacency, ignoring real risks of escalation.

KEY QUOTES

"Humans were always far better at inventing tools than using them wisely."

"We should never underestimate human stupidity. Both on the personal and on the collective level, humans are prone to engage in self-destructive activities."

"In the twenty-first century the most successful strategy is to sit on the fence and let others do the fighting for you."

No Culture Has All the Answers

Many cultures, religions, and nations believe they are central to history, but no one civilization is the source of human progress. Examples of cultural self-importance include:

- *Greeks* trace the roots of philosophy, democracy, and science to figures like Homer, Plato, and Sophocles.
- *Chinese* nationalists argue history began with the Yellow Emperor and all major innovations originated in China.
- *Hindu* groups claim ancient sages had knowledge of airplanes, nuclear weapons, and advanced science long before modern discoveries.
- *Muslims* view history before Prophet Muhammad as irrelevant, with Islam as the central force of civilization.
- *Western nations* (British, French, American) claim their innovations saved the world from primitivism.

"Most people tend to believe they are the centre of the world, and their culture is the linchpin of human history."

"Without Judaism you would not have had Christianity, but that doesn't merit giving much importance to Judaism when writing the history of the world."

- *Jews* assert that Jewish religious and ethical values shaped Western civilization's foundation.

In reality, human progress is a collective effort. Morality, art, spirituality, and creativity existed long before modern civilizations. None of today's nations or religions existed when early humans domesticated plants and animals, built the first cities, developed writing, currency and governance.

- *Discoveries by individuals* don't belong to their cultures. For example, Einstein's theory of relativity isn't a "Jewish" idea, just as Darwin's theory of evolution isn't a "Christian" discovery.

- *Progress requires humility* and history belongs to everyone. Recognize blind spots to temper arrogance, and develop a more respectful, cooperative world.

God, Morality, and the Human Agenda

Throughout history, people have invoked God to explain everything, from the creation of the universe to trivial social rules. Harari questioned if the creator of time and space would truly be concerned about bikinis, dietary restrictions, or sexual orientation. His message: Stop using God as an excuse for war, oppression, discrimination, and other human agenda.

- Religious texts (e.g. the Bible, Quran) were *written by humans, not divine beings*, to legitimize social norms and political structures. Religion helped to organize societies, but religious laws are not absolute truths—they're human-made systems that evolve over time.

Religion can help with morality and inner peace, but it's not the only path.

- *Morality* is not rooted in divine law, but empathy and the desire to reduce suffering. Rape, murder, and theft aren't wrong because God forbids them, but because they cause harm.

- *Inner peace*: Religion can offer comfort and meaning, but you don't need faith to cultivate peace, kindness, or ethical values.

Judge religion's value by its impact on behavior:

KEY QUOTES

"Morality, art, spirituality and creativity are universal human abilities embedded in our DNA."

"Einstein was Jewish, but the theory of relativity wasn't 'Jewish physics'."

"You want to wage war on your neighbours and steal their land? Leave God out of it, and find yourself some other excuse."

"The very same religions that inspire hate and bigotry in some people inspire love and compassion in others."

"Though gods can inspire us to act compassionately, religious faith is not a necessary condition for moral behaviour."

"If you really understand how an action causes unnecessary suffering to yourself or to others, you will naturally abstain from it."

- *Faith should uplift humanity*. A prayer or ritual is valuable if fosters peace and kindness. But if it fuels violence and division, then it's dangerous.

- *Secularism* offers an alternative ethical system based on shared understanding and responsibility, not divine authority.

Secularism as An Ethical System

Secularism is not just the absence of religion. It's a framework for ethical living based on universal values that transcend religious and cultural boundaries. Secular values are based on reason, not divine authority.

- *Truth*: Based on evidence, not faith. No single authority holds absolute truth—it must be tested, questioned, and refined.

- *Compassion*: Ethical decisions should reduce suffering. For example, rape is wrong because it causes harm, while consensual same-sex relationships pose no ethical issues.

- *Equality*: Every person has inherent worth, regardless of religion, nationality, or background.

- *Freedom*: True freedom involves the ability to think, question, and express ideas openly. It requires courage—to challenge beliefs and embrace uncertainty.

- *Responsibility*: Humans must own their actions and shape the world, rather than relying on divine intervention.

Secularism vs religion. Many religions also promote values like truth and compassion, but these are defined using divine law.

- Secularism, on the other hand, requires *critical thinking and moral reasoning*, which can be challenging. In times of crisis, people often abandon secular principles for rigid ideologies that promise certainty.

The challenge for any secular system lies in balancing open inquiry with certainty—to uphold critical thinking and moral reflection, while addressing the human need for order and stability.

KEY QUOTES

"Hurting others always hurts me too. Every violent act in the world begins with a violent desire in somebody's mind, which disturbs that person's own peace and happiness."

"Secularism can provide us with all the values we need."

"Secular people are certainly proud of the uniqueness of their particular nation, country and culture–but they don't confuse 'uniqueness' with 'superiority'."

"It takes a lot of courage to fight biases and oppressive regimes, but it takes even greater courage to admit ignorance and venture into the unknown."

"Humans should always retain the freedom to doubt, to check again, to hear a second opinion, to try a different path."

Part 4: Confronting The Struggle for Truth

In a world filled with misinformation and complexity, we must think critically, or our ignorance can be weaponized against us.

We Think We Know More Than We Do

Liberalism assumes that voters, consumers, and decision-makers act based on objective reasoning. In reality, human decisions are rarely rational—they're shaped by emotions, biases, mental shortcuts and peer/cultural influence.

The illusion of understanding: We often believe we know more than we actually do, leading to overconfidence and strong opinions on topics we barely understand.

- We *mistake collective knowledge for personal knowledge*. No single person can build an airplane, cure a disease, or run a government, yet we confidently express opinions on such topics.

- We *selectively focus* on information that confirms our beliefs and reject contradictory evidence.

- Ironically, those with the most power often have the weakest grasp of reality. *Leaders struggle to see reality* due to:

  (i) Lack of time: Leaders are too busy to deeply explore issues.

  (ii) Distorted feedback: People tell leaders what they want to hear, making it harder to uncover the truth.

To make better decisions, recognize how little we know. Question assumptions and biases, seek multiple sources of information, and beware of people or dogmas that claim to have all the answers.

KEY QUOTES

"If you feel overwhelmed and confused by the global predicament, you are on the right track."

"You know less than you think."

"We think we know a lot, even though individually we know very little, because we treat knowledge in the minds of others as if it were our own."

"People rarely appreciate their ignorance, because they lock themselves inside an echo chamber of like-minded friends and self-confirming newsfeeds."

"If you cannot afford to waste time–you will never find the truth."

"Questions you cannot answer are usually far better for you than answers you cannot question."

The Struggle for Justice in a Complex World

Moral certainty is an illusion in a global, interconnected world. True justice requires more than good intentions—it demands an accurate understanding of cause and effect.

- *Small-scale justice is easy to grasp*: If someone steals your bag of purchases, you recognize the injustice since you experience the direct harm.
- *Large-scale justice is harder to define*: The sheer number of parties involved makes it impossible to fully trace cause-and-effect relationships.
  - For example, your government might fund wars or oppressive regimes without your knowledge. Or, the food you eat might contain ingredients sourced through exploitation. So, who should be held accountable?

When faced with overwhelming complexity, humans rely on mental shortcuts that distort reality:

- *Shrinking large-scale problems* into simplistic narratives, e.g. defining the Syrian civil war as a personal feud between leaders.
- *Focusing on individual stories*, e.g. prioritizing a single victim's suffering while ignoring broader political and economic realities.
- *Weaving conspiracy theories*: Blaming a specific group, rather than accepting the world is too chaotic for one entity to control.
- *Clinging to rigid ideologies*: Seeking comfort from absolute beliefs that ignore uncertainty and blind spots.

Justice is never simple and requires intellectual humility. The best path forward is to challenge assumptions, seek multiple perspectives, and adapt to new information instead of clinging to rigid beliefs.

KEY QUOTES

"An inherent feature of our modern global world is that its causal relations are highly ramified and complex."

"When we try to comprehend relations between millions of people across entire continents, our moral sense is overwhelmed."

"The world has simply become too complicated for our hunter-gatherer brains."

"We are all complicit in at least some such biases, and we just don't have the time and energy to discover them all."

"The greatest crimes in modern history resulted not just from hatred and greed, but even more so from ignorance and indifference."

Post-Truth: Fiction, Misinformation and Lies

Humans are post-truth creatures. We interpret facts through emotions and beliefs rather than objective reasoning.

- Our ability to *create shared stories* has enabled large-scale cooperation. Examples of shared fictions include:
  - Religious myths: Billions believe in stories like Adam and Eve, or Buddhist reincarnation, despite lacking scientific evidence.
  - National myths: Ideas like a "sacred homeland" or "shared destiny" often rely on selective history rather than objective truth.
  - Corporate branding: Coca-Cola markets itself as a symbol of happiness and health, despite its role in obesity and diabetes.
  - Economic systems: A $100 bill is just paper—it has value only because we collectively believe in it.
  - Legal & political structures: Nations, corporations, and laws exist only because we agree they do.

Throughout history, leaders distorted truth to justify wars, gain power, and maintain control. What's different today is the speed and scale of misinformation fueled by the internet and social media.

- A false story believed by a few is "fake news." A fiction believed by billions for generations becomes *religion or ideology*.

Fiction and myths aren't always bad. Some help to unite communities, inspire action, and give meaning. The challenge is distinguishing between useful fictions and harmful lies. Harari offers 2 rules of thumb for navigating a post-truth world:

- *Pay for quality information*. If your news is free, you're likely the product. Reliable journalism, research, and content are worth investing in.

KEY QUOTES

"Humans control the world because they can cooperate better than any other animal, and they can cooperate so well because they believe in fictions."

"Religious and ideological dogmas are still highly attractive in our scientific age precisely because they offer us a safe haven from the frustrating complexity of reality."

"If you want power, at some point you will have to spread fictions. If you want to know the truth about the world, at some point you will have to renounce power."

"A lie told once remains a lie, but a lie told a thousand times becomes the truth."

"False stories have an intrinsic advantage over the truth when it comes to uniting people."

- *Verify facts through multiple expert sources*. No media outlet or belief system is free from bias. Seek peer-reviewed scientific research, academic books, and expert opinions for important topics. Use critical thinking and questioning to get as close to the truth as possible.

How Sci-Fi and Media Distort Reality

Most people don't learn about AI, the future, or technology by reading scientific articles—they learn from sci-fi movies like *The Matrix*, *Her*, *and Black Mirror*.

- Many sci-fi films *confuse intelligence and consciousness*. They fuel fears of machine rebellions while ignoring the real danger: a small elite controlling society through AI and algorithms.

- Other stories create the *illusion of free will*. Films like *The Matrix* and *The Truman Show* depict heroes waking up from a false reality, and discovering their "authentic self."

  - In reality, our thoughts, values, and choices are already shaped by biology, culture, history, and popular media. There's no "pure" self untouched by external influences.

  - Even if we lived in a simulation, our experiences would feel real. A digitally-triggered pain or joy is as real as a "physical" one in our minds.

It's impossible to escape external influences, but we can become more aware of the stories shaping us:

- Filmmakers can *portray science and technology more accurately*. For example, *Inside Out* effectively depicts human emotions as biochemical processes competing for control rather than a singular "self."

- Individually, we should recognize how stories—societal norms, ideologies, and culture—influence us and shape our perceptions. *Choose narratives* that empower rather than manipulate us.

KEY QUOTES

"It is the responsibility of all of us to invest time and effort in uncovering our biases and in verifying our sources of information."

"Perhaps the worst sin of present-day science fiction is that it tends to confuse intelligence with consciousness."

"The mind is never free of manipulation. There is no authentic self waiting to be liberated from the manipulative shell."

"When you escape the matrix the only thing you discover is a bigger matrix."

"Have you any idea how many movies, novels and poems you have consumed over the years, and how these artefacts have carved and sharpened your idea of love?"

"The mind is not the subject that freely shapes historical actions and biological realities–the mind is an object that is being shaped by history and biology."

Part 5: Preparing For the Future

To stay relevant and resilient in a fast-changing uncertain world, we need mental flexibility, emotional resilience, and self-awareness.

Education for the Future: Adaptability Over Rote Learning

Traditional education no longer works in an AI-driven world.

- In the past, schools focused on *memorizing facts and mastering fixed skills* (like learning a coding language or identifying chemicals in test tubes). That made sense when knowledge was scarce and the job market was stable.
- Today, the *biggest challenges* are information overload, mis-information, and constant change. Education must help people to stay relevant through continuous learning and adaptation.

Instead of focusing on static knowledge, education should develop **skills that remain useful** no matter how the job market evolves.

- *Nurture the 4Cs* of future-proof learning:
  - (i) Critical thinking: Analyze info, and separate fact from fiction.
  - (ii) Communication: Express ideas effectively across cultures, ideologies, and platforms.
  - (iii) Collaboration: Work seamlessly with both humans and AI.
  - (iv) Creativity: Develop innovative solutions to complex problems.
- Build *mental and emotional flexibility*:
  - (i) Mental flexibility: Learn, unlearn, and reinvent yourself.
  - (ii) Emotional resilience: Stay calm and adaptable in uncertain times.
  - (iii) Self-awareness: Understand your biases and mental patterns to avoid being manipulated by algorithms.

KEY QUOTES

"Escaping the narrow definition of self might well become a necessary survival skill in the twenty-first century."

"We cannot be sure of the specifics, but change itself is the only certainty."

"If this generation lacks a comprehensive view of the cosmos, the future of life will be decided at random."

"To keep up with the world of 2050, you will need not merely to invent new ideas and products–you will above all need to reinvent yourself again and again."

"If the algorithms indeed understand what's happening within you better than you understand it, authority will shift to them."

Part 5: Preparing For the Future

To stay relevant and resilient in a fast-changing uncertain world, we need mental flexibility, emotional resilience, and self-awareness.

Education for the Future: Adaptability Over Rote Learning

Traditional education no longer works in an AI-driven world.

- In the past, schools focused on *memorizing facts and mastering fixed skills* (like learning a coding language or identifying chemicals in test tubes). That made sense when knowledge was scarce and the job market was stable.
- Today, the *biggest challenges* are information overload, mis-information, and constant change. Education must help people to stay relevant through continuous learning and adaptation.

Instead of focusing on static knowledge, education should develop **skills that remain useful** no matter how the job market evolves.

- *Nurture the 4Cs* of future-proof learning:
  - (i) Critical thinking: Analyze info, and separate fact from fiction.
  - (ii) Communication: Express ideas effectively across cultures, ideologies, and platforms.
  - (iii) Collaboration: Work seamlessly with both humans and AI.
  - (iv) Creativity: Develop innovative solutions to complex problems.
- Build *mental and emotional flexibility*:
  - (i) Mental flexibility: Learn, unlearn, and reinvent yourself.
  - (ii) Emotional resilience: Stay calm and adaptable in uncertain times.
  - (iii) Self-awareness: Understand your biases and mental patterns to avoid being manipulated by algorithms.

KEY QUOTES

"Escaping the narrow definition of self might well become a necessary survival skill in the twenty-first century."

"We cannot be sure of the specifics, but change itself is the only certainty."

"If this generation lacks a comprehensive view of the cosmos, the future of life will be decided at random."

"To keep up with the world of 2050, you will need not merely to invent new ideas and products–you will above all need to reinvent yourself again and again."

"If the algorithms indeed understand what's happening within you better than you understand it, authority will shift to them."

Seek Meaning Beyond Stories

Humans are storytelling creatures. We seek meaning-making stories that (i) give us a role in the world and (ii) connect us to something greater than ourselves.

- The best stories are *open-ended*, allowing reinterpretation over time. Popular meaning-making narratives include:

  (i) Circle of Life: Every person has a unique function in the cosmic cycle; peace comes from fulfilling that role.

  (ii) Communism: Human history is a struggle between classes, and true meaning comes from fighting for the working class.

  (iii) Liberalism: Meaning is found in individual freedom, self-expression, and personal fulfillment.

- Such narratives are a *double-edged sword*: Stories provide identity, purpose, and social cohesion, but they also create blind spots, justify extreme sacrifices, and oversimplify reality.

- People often *cling to stories* because:

  (i) They're deeply ingrained from childhood;

  (ii) They hold societies together; and

  (iii) They're reinforced through rituals and sacrifice. For example, soldiers who die for their nation are honored as patriots, even if the war was unjust.

Throughout history, people have held a "portfolio" of identities and beliefs. For example, a religious nationalist may believe in Jesus but also oppose welfare programs.

- In modern times, people *pick and choose beliefs/stories* that suit their needs rather than commit to one story. This freedom of choice can leave people stuck in an endless search for meaning.

Ultimately, life not a story. To understand the universe, life, and yourself, observe your own mind: Why do you suffer? Why do you feel certain urges? How are these are used to manipulate you?

KEY QUOTES

"Homo sapiens is a storytelling animal, that thinks in stories rather than in numbers or graphs, and believes that the universe itself works like a story, replete with heroes and villains, conflicts and resolutions, climaxes and happy endings."

"It is our own human fingers that wrote the Bible, the Quran and the Vedas, and it is our minds that give these stories power."

"Most stories are held together by the weight of their roof rather than by the strength of their foundations."

"Any story is wrong, simply for being a story. The universe just does not work like a story."

"The real enigma of life is not what happens after you die, but what happens before you die. If you want to understand death, you need to understand life."

- Only by understanding yourself can you *consciously choose which stories to believe in*, rather than letting them control you.

Meditation: Observe the Mind to Understand Life

As a young man, Harari grappled with existential questions but found no satisfying answers. His breakthrough came when he discovered Vipassana meditation. After spending 10 days observing his breath and bodily sensations without reacting to them, he realized:

- *We have little control over our minds*: Despite his education, Harari struggled to focus his thoughts for even 10 seconds.
- *Suffering comes from our reactions, not external events*: People don't react to events themselves but to the physical sensations they trigger. For example, anger doesn't come from an insult itself but from the bodily tension triggered by the insult. Pain arises not from external hardship but the mind's resistance to that hardship.

To answer life's biggest questions, we must understand both the human brain and mind.

- The *brain and mind* offer 2 paths to understanding human consciousness. The brain is a biological system of neurons and biochemical reactions, while the *mind* is a flow of subjective experiences, such as pain, joy, and love.
- Most people seek meaning through religion, ideology, or nationalism, but these are just stories we tell ourselves. Meditation allows us to *observe our mental patterns directly*, revealing how thoughts arise, how emotions manifest, and how we perceive and react to experiences. This can teach us more about life than philosophical debates or academic research.
- Neuroscientists can study brain activity, but they can't fully explain how subjective experiences emerge from neural activity. To truly understand consciousness, we must *combine both perspectives*: study the brain with neuroscientific tool and explore the mind through direct experiences like meditation.

KEY QUOTES

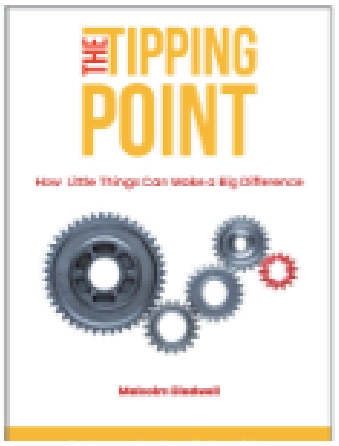
"I think I learned more about myself and about humans in general by observing my sensations for these ten days than I learned in my whole life up to that point."

"Suffering is not an objective condition in the outside world. It is a mental reaction generated by my own mind. Learning this is the first step towards ceasing to generate more suffering."

"Suffering is not an objective condition in the outside world. It is a mental reaction generated by my own mind."

"The most real thing in the world is suffering."

"Meditation never came into conflict with scientific research. Rather, it has been another valuable tool in the scientific toolkit, especially when trying to understand the human mind."



THE TIPPING POINT

HOW LITTLE THINGS CAN MAKE A BIG DIFFERENCE

By Malcolm Gladwell

The Big "So What" ???

The book seeks " to answer two simple questions.... Why is it that some ideas or behaviour or products start epidemics and others don't? What can we do to deliberately start and control positive epidemics of our own? "

Introduction

Gladwell starts off by explaining the concept of "the tipping point" with two stories. It is about reaching the boiling point, or critical mass, where everything tips and spreads like a virus. The book illustrates this concept in depth with various examples, starting with how Hush Puppies (an aging shoe line at that time) became an elite fashion statement in less than two years, followed by how the high crime rate in New York City suddenly dropped after many years.

The Three Rules of Epidemics

What causes something to tip and spread like an epidemic? Gladwell identifies three prerequisites or "rules of epidemics":

- The Law of the Few : A tiny percentage of people are accountable for building huge initial momentum because of their special social gifts. These are the Mavens, the Connectors and the Salesmen.
- The Stickiness Factor : There is a simple way to package information such that it is irresistible and memorable - i.e. it "sticks".

KEY QUOTES

The Tipping Point

"The name given to that one dramatic moment in an epidemic when everything can change all at once is the Tipping Point."

- The Power of Context : Human beings are a lot more sensitive to their environment than they seem. By changing the context and managing their social groups, you can shape their behaviours.

1 The Law of the Few

Many trends are started by the small groups of people – Mavens, Connectors and Salesmen. Gladwell provides several detailed examples and past events that show how to identify each of these, and how they help to tip epidemics.

Mavens (the Data Banks): Mavens seem to know everything. They have the inside scoop on the marketplace and know things that we don't. Besides accumulating knowledge, they have a compulsion to share their knowledge and help others make informed decisions. In short, "mavens are really information brokers, sharing and trading what they know".

Connectors (the Social Glue): Connectors are those who seem to know everyone. They have an "ability to span many different worlds (due to) some combination of curiosity, self-confidence, sociability and energy". Because they have a foot in so many realms, they essentially bring them together.

Salesmen (the Persuaders): Salesmen are those who seem to effortlessly induce others' buying decisions and behaviours. They have innate skills and charisma that make them so persuasive. "It's energy. It's enthusiasm. It's charm. It's likeability. It's all of those things and yet something more."

KEY QUOTES

Law of the Few

"The success of any kind of social epidemic is heavily dependent on the involvement of people with a particular and rare set of social gifts…I call them Connectors, Mavens, and Salesmen."

"Mavens are data banks. They provide the message. Connectors are social glue: they spread it. Salesmen (have) the skills to persuade us when we are unconvinced of what we are hearing."

Reaching out to the marketplace through influencers may seem obvious today, but this was definitely a novel idea at the time Gladwell wrote the book. It still an important reminder of where we should focus our resources when launching a word-of-mouth campaign.

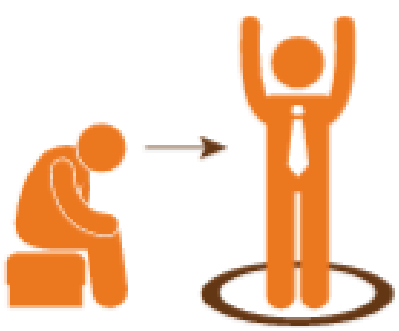
2 The Stickiness Factor

Stickiness means that a message leaves such a deep impression that it's stuck in your head. There are many ways to make something stick, be it stories, audience participation or repetition. The tough part is to find the right stickiness factor for the target audience.

Gladwell goes into details of how two popular children's TV shows, Sesame Street and Blue's Clues, managed to capture children's attention and became major successes. He shows examples of how success often hinges on small details (such as placements and sequencing) rather than major changes (such as a revamp of the content).

3 The Power of Context

There are 2 parts to understanding and applying the Power of Context



a. Change the Context to Change Behaviours:

Gladwell points out that human character isn't as stable or fixed as we may think. Our characters are a loose combination of habits, interests and tendencies which vary depending on

KEY QUOTES

The Stickiness Factor

"There is a simple way to package information that, under the right circumstances, can make it irresistible. All you have to do is find it."

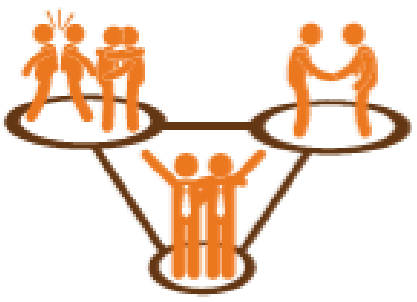
The Power of Context

"Human beings are a lot more sensitive to their environment than they may seem... an epidemic can be reversed, can be tipped, by tinkering with the smallest details of the immediate environment."

circumstances the contexts we're in. When the context or immediate details of our situation are changed, the definition of acceptable behaviour (and consequently our actual behaviours) will change too.

Gladwell gives several examples of how people may behave seemingly out of character, including committing crime, when they are placed in different environments. In short, your heart-felt convictions and actual thoughts are less important in determining your actions and behaviors than your immediate context.

Gladwell also examines the "Broken Window Theory," which suggests that broken windows in a neighborhood will lead to higher violent crime rates. Based on the Power of Context, to reduce the crime rate, we should fix the windows rather than arrest people for crime.



b. Rule of 150

Gladwell moves next into the concept of social channel capacity. He suggests that we can increase our chances of tipping epidemics simply by manipulating the size of groups. The best way to manage a group of people is to keep the group sizes within 150 people. When a group is too big, people don't have enough shared memories, nor are they close enough for peer pressure to effectively kick in. Use organized mechanisms to facilitate the movement of new ideas and information within and between the groups, so it's easier for social influences to tip things over.

This important rule gives us fresh lenses to understand the dynamics of social media and professional networks like LinkedIn, Facebook and Twitter.

Applying the Rules of Epidemic

Focus your resources on the few. Starting an epidemic requires resources. Focus them where it matters – on the Connectors,

KEY QUOTES

"Keeping things under 150 just seems to be the best and most efficient way to manage a group of people... If you get too large, you don't have enough work in common. You don't have enough things in common".

Mavens and Salesmen, as they will determine if successfully spark an epidemic to begin with. Don't waste your resources elsewhere; concentrate them fully on those 3 groups.

Find your Stickiness Factor. Don't rely on your intuition or gut-feel of what will work. Test your theories on what messages will stick, before you roll them out on a large scale. Notably, small details matter as much as, if not more than, big changes. Pilot testing, Beta testing and A-B testing etc. are all ways to identify your Stickiness Factor before a full launch.

Manage contexts to shape behaviour. First, consider the environment, circumstances and conditions when choosing the timing and location of your messages. Second, keep group sizes to under 150 and use systems and processes to keep the community tightly connected.

Other Useful Details in the Book to Look Out For

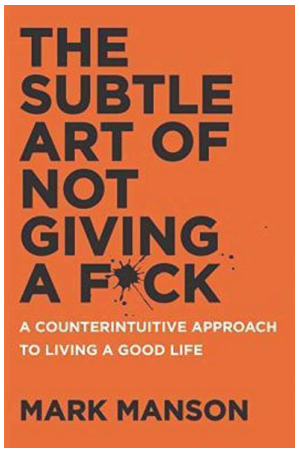
Gladwell builds a strong case for the 3 rules of epidemics, with a wide range of examples and case studies to help us understand how epidemics work (and why they fail). Notably, his examples and illustrations cover a variety of industries and scenarios including:

- Retail brands such as shoe companies Hush Puppies and Airwalk, and innovation clothing company Gore
- Politics, crime rates, teen suicide and smoking trends, including the reversal of negative epidemics
- Real-life examples of connectors, mavens and salesmen: who they are, what makes them different, and how they tip epidemics
- Children and education programs, including Sesame Street, Blue's Clues and medical programs
- Books and communities including Divine Secrets of the Ya Ya Sisterhood and the Hutterite Methodist community

KEY QUOTES

Starting an Epidemic

"Merely by manipulating the size of a group, we can dramatically improve its receptivity to new ideas. By tinkering with the presentation of information, we can significantly improve its stickiness. Simply by finding and reaching those few special people who hold so much social power, we can shape the course of social epidemics."



THE SUBTLE ART OF NOT GIVING A F*CK

A Counterintuitive Approach to Living a Good Life

MARK MANSON

The Big "So What"

Today, people enjoy more material wealth and comforts, yet tend to feel more impoverished emotionally and psychologically. This book offers insights and tips to help us cope with our pain, failures and regrets, so we can live fully and find genuine happiness.

Introduction

We are constantly bombarded by messages about becoming happier, healthier, smarter, and richer. We buy more things, tips and experiences, hoping to improve our image, happiness level and satisfaction. Yet, in the pursuit of more, we end up losing sight of what we already have, and reinforce our sense of lack.

Manson explains why our modern values—like success, positivity, greatness, and freedom—can actually make us more insecure and miserable. The way to be happy and fulfilled, he says, is to not give a f*ck about everything we're told to care about. Instead, get clear on what truly matters, focus your choices on those few priorities, and accept that in spite of that, you'll still make stupid mistakes and suffer occasionally.

In this summary, we'll present the key ideas in 2 parts:

- Debunking modern myths on success and happiness; and
- Embracing the 5 counterintuitive values for a good life

KEY QUOTES

"This book will turn your pain into a tool, your trauma into power, and your problems into slightly better problems."

"We are so materially well off, yet so psychologically tormented in so many low-level and shallow ways."

"The key to a good life is not giving a fuck about more; it's giving a fuck about less, giving a fuck about only what is true and immediate and important."

Debunking Myths on Success and Happiness

Stop Trying

Why do people feel unhappy and depressed despite having more choices and material success?

The **paradox** is this: the more you pursue the positives, the more negative you'll feel and vice versa:

- *The more you chase after the positives, the worse you'll feel*. Those who desperately want to be rich, worthy or happy tend to feel poorer, more unworthy or unhappy, no matter how much they already have in life.

- On the other hand, *the more you accept the negatives in your life, the better you'll feel*. Embracing your failures makes you wiser, accepting your flaws makes you more authentic, and facing your fears gives you more confidence.

We're surrounded by messages about why we should overcome our negative feelings and feel good about ourselves—so much so that we tend to feel bad for feeling bad. Manson calls this the "**feedback loop from hell**".

- Imagine you're angry about a mistake you've made. You become angry with yourself for dwelling on your mistake (since you know you should be positive), and you're now angry about feeling angry. It doesn't help that the TV, internet and social media are full of amazing stories and images of people who've rebounded from failures and are now living happy, perfect lives. So now you feel doubly bad for feeling bad, and the *negative loop* continues.

- The way to stop this feedback loop is to *stop giving a f*ck about everything* or trying to be perfect. Realize that shortcomings and bad feelings are perfectly normal, and stop fretting over them.

KEY QUOTES

"Our crisis is no longer material; it's existential, it's spiritual. We have so much fucking stuff and so many opportunities that we don't even know what to give a fuck about anymore."

"The more you pursue a positive experience, the more negative you feel. The more you accept a negative experience, the more positive you feel."

"These moments of non-fuckery are the moments that most define our lives."

However, this doesn't mean that you should become indifferent to everything. There are **3 nuances to not giving a f*ck**:

- Don't give a f*ck about *conventional norms and others' opinions*. Dare to be *different*, be it making that scary career switch which everyone advises against, or leaving that abusive spouse.

- Don't give a f*ck about *pain and adversity*. You can't expect to make real breakthroughs while avoiding challenges and failures. Figure out what's truly important, what's worthy of your time and energy, and give a f*ck about *that* above all else—including your pain and fears.

- People who claim they don't care about anything are actually hiding behind a mask of indifference to avoid making tough choices in life. *You have to give a f*ck about something*, so choose your priorities carefully. Don't waste time and energy on things that don't matter, e.g. the rude waiter, your colleague getting promoted over you, or missing a great bargain. Decide what you do care about, go all out for it, and be prepared to put aside everything else, including others' opinions and the risk of failure.

KEY QUOTES

"Not giving a fuck does not mean being indifferent; it means being comfortable with being different."

"To not give a fuck is to stare down life's most terrifying and difficult challenges and still take action."

"The point isn't to get away from the shit. The point is to find the shit you enjoy dealing with."

Pain isn't bad

Pain is your friend. Pain is a part of our biological feedback system to spur us into action.

- It's not something bad to be avoided, but *a tool* to tell us something needs our attention. *Physical pain* warns us of possible danger (e.g. a hot stove or a knife blade), while *psychological pain* tells us that something is out of balance.

- Pain and suffering are an integral part of human existence. No one can avoid them, e.g. the rich suffer due to their riches while the poor suffer due to their poverty. Since *pain is inevitable*, trying to avoid it will only bring more pain. Instead, learn to accept it and let it go.

"Our own pain and misery aren't a bug of human evolution; they're a feature… Pain, in all of its forms, is our body's most effective means of spurring action".

In fact, happiness doesn't come from being problem-free. Happiness comes from solving meaningful problems.

- Everyone has problems, and new problems will keep surfacing. In fact, your solution to one problem often creates even more problems. For example, you may buy a gym membership to overcome the inertia to exercise, but now you must make time to go to the gym. The person you love and marry is likely to be the person you quarrel with the most. Your dream job is also likely to give you the most challenges and sleepless nights. So, the key is to *find meaningful problems that you'll enjoy solving*.

- When we *deny/avoid our problems* or tell ourselves they can't be solved, we feel miserable. Many people also distract themselves with temporary highs like alcohol or adventures. The longer you avoid your problems, the more painful it will be when you eventually face them.

Treat your emotions as signposts. Our feelings are biological signals to tell us what's working or not working. However, emotions are not always accurate and they don't last. Hence, don't suppress your emotions, over-identify with them, nor make decisions based on emotions alone.

All of us want positive feelings and outcomes, but we don't stop to consider the pain and struggles needed to achieve those outcomes. Rather than focusing only on the outcomes you'd enjoy, ask yourself: What pain and struggles might you enjoy and sustain? For example, will you enjoy the pain of training for a triathlon, or the uncertainties of entrepreneurship? **By identifying what you're willing to endure**, you can fall in love not just with the reward but also the process.

You're not special

Everywhere we turn, we hear writers, speakers and experts telling us that we're unique and destined for greatness. We're surrounded daily by extreme stories about the biggest, grandest, fastest, richest people or events. These stories are crafted to grab our attention, and they also create dangerous perspectives that extremes are the norm, and being average is a sign of failure.

KEY QUOTES

"The secret sauce is in the solving of the problems, not in not having problems in the first place."

"Problems never stop; they merely get exchanged and/or upgraded."

"Emotions…(are) feedback mechanisms telling us that something is either likely right or likely wrong for us—nothing more, nothing less."

"You can't win if you don't play."

"Our struggles determine our successes."

"This flood of extreme information has conditioned us to believe that exceptionalism is the new normal."

In reality, most of us are average. Even if we excel in 1 area, we're usually average or below average in other areas. When people have unrealistic expectations of what's "normal", they (a) feel insecure/inadequate and try to overcompensate by pursuing get-rich-quick schemes, taking extreme actions, voicing radical views, and/or (b) develop an inflated sense of self-importance and a false sense of entitlement.

People who achieve extraordinary results don't start by expecting to be great, or feeling entitled/special. They accept that they're average and the bulk of the work they do will be mundane and inconsequential. They focus on improving themselves day after day, rather than pretending to be the next big thing when they're not. In the process, they learn to appreciate the small pleasures of learning, solving problems, helping others, and connecting with friends and loved ones.

Likewise, when we believe our challenges are unique, we tend to feel as if the world owes us something. In reality, everyone goes through trauma in life—be it parental divorce, a bad accident, or a major betrayal. Having challenges doesn't make you privileged or entitled in any way. There are many others who face similar, if not worse, challenges than you, and have taken concrete steps to deal with them.

Suffer Purposefully

Throughout history, humans have willingly suffered for causes they believe in—be it voyaging to discover distant lands or waging war for the glory of an empire. Since suffering is inevitable, the question we should be asking isn't how we can end our suffering, but for what *purpose* are we suffering.

We gain self-awareness in layers:

- 1st level: Understand *what* emotion you're feeling, e.g. angry, sad, or happy. Learn to overcome your emotional blind spots, or the emotions you've been taught to ignore.

- 2nd level: Understand *why* you're feeling that way. It may take months or years to uncover the root causes.

KEY QUOTES

"The Internet has not just open-sourced information; it has also open-sourced insecurity, self-doubt, and shame."

"The ticket to emotional health…comes from… accepting the bland and mundane truths of life."

"The easier and more problem-free our lives become, the more we seem to feel entitled for them to get even better."

"Self-awareness is like an onion. There are multiple layers to it, and the more you peel them back, the more likely you're going to start crying at inappropriate times."

"Our values determine the nature of our problems, and the nature of our problems determines the quality of our lives."

- 3rd level: Understand your *personal values*, which affect what you define as success or failure, how you measure/judge yourself and others, and what you do or don't do. This is the most important but difficult layer to peel open, because you must get uncomfortable and be honest with yourself.

Many self-help tips focus on the first 2 levels of awareness. However, fundamental change occurs at the 3rd level—when you **change your values**, you change how you view success and failure in life.

- After Dave Mustaine was kicked out of Metallica, he went on to form a new band and became massively successful in his music career. Yet, 20 years later, he still felt like a failure for being thrown out of his former band. By contrast, Pete Best was kicked out of The Beatles and never rebuilt his music career. However, he met his wife, built a loving family, and believed he was much happier than he would've been if he had stayed with The Beatles. Both men faced similar setbacks, but took different actions and *evaluated their lives differently* because they held different values.

- Most of us instinctively use money and status to measure ourselves against others, but these are not the only yardsticks we can use. The next time you feel troubled, examine the underlying reasons and values behind your feelings, and consider if you could re-evaluate the situation using *better values or metrics*.

Good and bad values. Manson says that good values should meet 3 criteria: be (a) based on facts, (b) socially-constructive and (c) immediate and controllable. Bad values are the opposite.

- *Good, healthy values* are intrinsic and fully within your control since you can always shift your attitude or perspective. Examples include: honesty, innovation, respect for self and others, curiosity, and humility.

- *Bad, unhealthy values* are extrinsic and are thus not fully within your control. Common examples include:

  (a) *Pleasure*: It provides short-term, superficial satisfaction but brings emptiness in the long-run.

KEY QUOTES

(b) *Material success*: Research found that material success improves happiness only insofar as it helps people to meet their basic needs (e.g. food and shelter). Once those needs are met, additional wealth has almost no impact on happiness.

(c) *Being right*: This only prevents you from acknowledging your flaws and learning from your mistakes.

(d) *Staying positive*: It's unhealthy to focus only on the positives. Acknowledging the negatives is the only way to address our problems to generate happiness.

In short, self-improvement is really about identifying better values, prioritizing them, and learning not to give a f*ck about what doesn't matter.

The 5 Counterintuitive Values for a Good Life

Take radical responsibility

When you take responsibility for your problems, you **gain power** over them.

- When you feel that you're forced to face a problem, or blame others for your unhappiness, you feel victimized and miserable. You miss the fact that only you can control your emotions, and stop considering how you may have contributed to the situation. On the other hand, when you *choose* to tackle a problem, you can actively look for solutions and thus feel empowered and energized.

- Imagine that your business partner has just cheated you of $1mil. You can choose to feel helpless and depressed, or feel motivated to turn things around. You can blame everything on your partner and bad luck, or you can acknowledge that you failed to identify the tell-tale signs and do your due-diligence.

KEY QUOTES

"Constant positivity is a form of avoidance, not a valid solution to life's problems."

"When you give better fucks, you get better problems. And when you get better problems, you get a better life."

"Often the only difference between a problem being painful or being powerful is a sense that we chose it, and that we are responsible for it."

You're always choosing. Even though you can't control what happens around you, you can *always* control how to interpret these events and how you respond (or not respond) to them. Even saying "I have no choice" or "there's nothing I can do" is in itself a choice.

- Even *when life deals you a bad hand* (e.g. being born with deficiencies, losing a loved one), you can choose how to react. No matter how severe your setback, there's always someone else who've been dealt a worse hand and made something out of his her circumstances.

- *Responsibility vs Fault*. We love to take credit for success, yet we avoid responsibility for problems because we wrongly associate responsibility with fault. Taking responsibility for a problem will not put you at fault, e.g. a judge is responsible for judging a murder case, even though he's not at fault for the murder.

- When we *criticize others and complain* about how offended we are, it feels good because we seem to be on moral high ground. However, in the process, (a) we forget that democracy is about respecting diverse viewpoints, and (b) we get so distracted by the trivialities that we lose sight of the truly important issues.

Making the shift. The next time you find yourself feeling offended, victimized or self-righteous, stop to consider if the issue really matters. If not, choose to let it go and focus on something more meaningful. It will take time to figure out what values really matter to you, but it's never too late to start today.

Embrace Uncertainty

Test your assumptions. Much of what we consider to be "universal truths" could actually be wrong. Mankind once believed that diseases could be cured by draining bad blood, and that the sun revolved around Earth. At some point, all of us were also absolutely certain about something that turned out to be totally wrong.

- *Success and learning fall on a spectrum*. You don't move from failure to success, or from wrong to right. You move from less successful to more successful, from wrong to less wrong.

KEY QUOTES

"The more we choose to accept responsibility in our lives, the more power we will exercise over our lives."

"Growth is an endlessly iterative process...We are always in the process of approaching truth and perfection without actually ever reaching truth or perfection."

- *There's no "right" ideology or viewpoint*. Our values and beliefs are formed from our subjective interpretation of the limited experiences we have. Over time, we each form different views on the meaning of life and the best way to live. Since all of us have different experiences, we'll also have different perspectives and conclusions about life.

- The only way to grow is to realize that *your values and beliefs aren't absolute*—they can always change or be proven wrong. Don't insist on being right, or cling on to beliefs like "I'm not smart enough", "no one will like me". Treat them as assumptions to be tested.

Don't trust your brain. Research shows that the human brain is highly prone to biases, mistakes, and imperfect memories.

- To help us understand the world, our brain constantly creates associations between cues and experiences. However, it may *misinterpret cues* ("he's up to no good because he keeps staring at her bag"), or see *imaginary patterns* ("I'm getting X because I do Y"). Once we form a conclusion or bias, we tend to subconsciously dismiss cues that're inconsistent with our beliefs or recall only details that support our biases/feelings.

- Our brains also don't remember things perfectly. Each time we recall something, we tend to fill in the gaps with our own imagination, e.g. using images from the TV or internet. Over time, our *memories can become distorted*. We may even invent memories of events that never happened.

The dangers of absolute certainty. When we're absolutely sure about something, we feel insecure if things don't turn out as expected. We start to justify that it's ok to cheat, take what's rightly ours, or dish out punishment that others deserve.

- Psychologist Roy Baumeister found that people who do bad/evil things tend to feel *fully justified* in their actions, e.g. they believe they have the right to rape women or torture people.

- On the other hand, when we *embrace uncertainty*, we feel more comfortable about our ignorance and no longer feel the need to judge others and ourselves. The first step to learning and solving problems is to accept that your current priorities, values, beliefs and actions may be wrong—only then can you consider potentially better alternatives.

KEY QUOTES

"Many people become so obsessed with being "right" about their life that they never end up actually living it."

"We're in a perpetual state of misleading ourselves and others for no other reason than that our brain is designed to be efficient, not accurate."

"Evil people never believe that they are evil; rather, they believe that everyone else is evil."

"The only way to solve our problems is to first admit that our actions and beliefs up to this point have been wrong and are not working."

A related concept, Manson's Law of Avoidance, says that we'll avoid things that threaten our **self-identity,** e.g. avoid risks to protect an image of infallibility, or stay in a painful relationship to prove that we're steadfast.

- Instead of limiting yourself to a certain self-identity, tell yourself that you're still *discovering who you are*, so you stay humble and open-minded.

- Define yourself in the *broadest, simplest way* (e.g. a friend, a creator, a father) so your identity is less likely to be threatened, and you're less likely to feel special and entitled.

Learn to ask yourself **3 questions**: (a) "What if I'm wrong?" (b) "What would it *mean* if I were wrong?" and (c) "Would being wrong create a better or a worse problem for both myself and others?"

Fail Forward

Your values and beliefs determine how you approach life, e.g. you may have a greater fear of failure if you seek to be well-liked (compared to if you seek to improve your relationships). Go for **process-oriented values** that allow you to embrace failure. Generally, the longer you've failed at something, the more improvements you'll make and the greater your eventual success or mastery.

Accept pain (e.g. anxiety, fear, sadness) as an essential part of psychological growth.

- At the *lowest points in our lives*, we're often forced to question why we're failing and to consider what we must do to move forward. That's why people who've overcome great suffering and pain (e.g. warfare) tend to feel more grateful, confident and grounded.

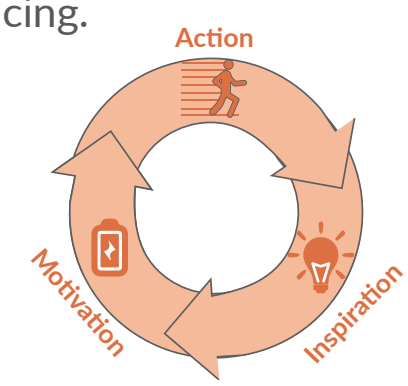
- Pain can make simple questions (e.g. "How do I say no"?) seem difficult and complex. In reality, we're held back by *underlying fears* (e.g. fear of rejection, fear of letting down our loved ones). Remember that these are merely assumptions, and you won't know if they're true unless you put them to the test.

KEY QUOTES

"Being able to look at and evaluate different values without necessarily adopting them is perhaps the central skill required in changing one's own life in a meaningful way."

"We can be truly successful only at something we're willing to fail at."

If you're stuck, just **start doing something** (anything), and you may find new ideas and answers surfacing.



- You don't always need motivation to drive action. When you take action, you'll trigger the *3-part cycle* of action, inspiration and motivation.

- To overcome the fear of failure, don't define success based on end-results. *Define success as the act of taking action*.

Get comfortable with rejection

Freedom through commitment. Many of us have been conditioned by our consumerist culture to believe that it's better to have more.

- While it's rewarding to enjoy diverse experiences, it can be equally (if not more) fulfilling to *focus on a few priorities* that matter. Commitment frees you from trivialities and allows you to dive deeper into what's most meaningful (e.g. deepening a relationship or mastering a craft).

- Psychologists found that *having too many choices* can reduce our level of happiness, because we end up wondering what we missed out. We also get diminishing satisfaction from excessive indulgence (e.g. your 100th house or holiday will be much less exciting that your first few).

- *Choosing your priorities*. In order to commit to a relationship, career, craft or value, we must be willing to reject something else. Ultimately, our choices—including what we choose to reject or commit to—will define who we are.

To build healthy relationships, it's vital to establish **trust and boundaries**. This requires both parties to be able to say and hear the word "no".

- In *unhealthy relationships*, people use one another to escape their own problems, or they try to "fix" others so they can feel good about themselves. They may expect others to take responsibility for their problems (e.g. a husband asking his wife

KEY QUOTES

"Action isn't just the effect of motivation; it's also the cause of it."

"Breadth of experience is likely necessary and desirable when you're young…But depth is where the gold is buried."

"More is not always better…We are actually often happier with less."

"When our highest priority is to always make ourselves feel good, or to always make our partner feel good, then nobody ends up feeling good."

not to go out with her friends because he feels insecure), or they may take responsibility for others' problems (e.g. pretending to agree with a friend so she won't feel rejected). When the goal of a relationship is to make yourself or your partner feel good, it'll result in pretense and manipulation, and things eventually fall apart.

- *Healthy relationships* come with strong boundaries—each party accepts full responsibility for his/her own values and problems. For example, a husband may acknowledge his insecurities and ask his wife for support to work through it.

- When *trust* has been broken, it can only be rebuilt with 2 things: (a) the trust-breaker must truly examine and identify the underlying values behind the breach of trust (e.g. need for validation, lack of control), and (b) be willing to change and prove it through action.

Contemplate your mortality

Many ancient philosophers have advocated the practice of **contemplating death**—it helps us to put our adversities in context and to appreciate life. People who fear death will not dare to live fully, while those who've confronted their mortality will become free to live each day to the fullest.

Ponder about your death and ask yourself: How will the world be different when you're gone? What is your legacy? How will you leave the world a better place?

- If you believe that the universe revolves around you, that you're entitled to greatness, suffering all the injustices, and/or need to amass a huge legacy so you won't be forgotten, you'll constantly feel the need to prove yourself and be plagued by fears of rejection, failure and death.

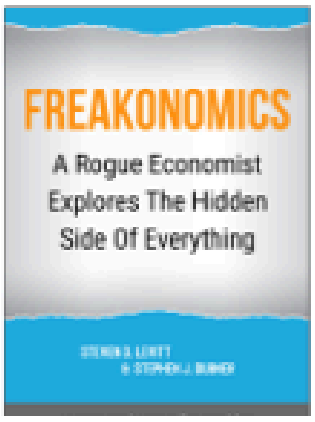
- However, if you can accept your life as a passing grain in the timeline of the universe, and focus on contributing to a wider cause that outlives you, you'll find true happiness. Make peace with death and make each living moment count—to discover yourself and live fully with no inhibition or shame.

KEY QUOTES

"Trust is like a china plate... If you break it more and more times, eventually it shatters to the point where it's impossible to restore."

"By spending the majority of my short life avoiding what was painful and uncomfortable, I had essentially been avoiding being alive at all."

"The only way to be comfortable with death is... to choose values that stretch beyond serving yourself, that are simple and immediate and controllable and tolerant of the chaotic world around you. This is the basic root of all happiness."



FREAKONOMICS

A Rogue Economist Explores
the Hidden Side of Everything

STEVEN D. LEVITT & STEPHEN J. DUBNER

Introduction

Economics is fundamentally about understanding how people respond to incentives to get what they want and need. This book explores the hidden side of things—from crime to parenting—to show that things are often not what they seem. We tend to see things through our morals and ideals, when everything actually operates based on economic incentives and disincentives.

The book comprises 6 key chapters with no unifying theme. In each chapter, the authors ask a seemingly-strange question, then use detailed stories and data to uncover the unexpected and often-uncomfortable truths:

Question	Freakonomics Answer
What do school teachers and sumo wrestlers have in common?	They respond to incentives, and will cheat if the incentives are "right".
How is the Ku Klux Klan like a group of real estate agents?	They both use/manipulate information for their own gains. Information is power.
Why do drug dealers still live with their moms?	Most drug dealers make much less money than we think. Conventional wisdom is often wrong.
Where have all the criminals gone?	The fall in crime rates in the U.S. in the 1990s was *not* due to most of the factors we read about in the newspapers.
What makes a perfect parent?	Parenting strategies and techniques matter much less than you think.
Would a Roshanda by any other name smell as sweet?	Names are correlated with your life outcomes, but they're a only a reflection (not a cause) of your circumstances.

In the next section, we'll dive into each of the 6 areas of discoveries addressed in this book.

KEY QUOTES

"What this book is about is stripping a layer or two from the surface of modern life and seeing what is happening underneath."

"Morality...represents the way that people would like the world to work—whereas economics represents how it actually does work."

Uncovering the Hidden Side Of Things

Incentives and Cheating

Our world revolves around incentives. To understand and solve problems, we must figure out how incentives really work.

An incentive is basically a way of encouraging people to do more (or less) of something, e.g. rewards for getting good grades vs punishments for bad behavior. Incentives are the building blocks of economics: almost every decision can be explained through incentives. To be effective, they must relate to things that people want or need.

There are 3 types of incentives: economic, social, and moral. Most incentive schemes include all 3 elements.

- For example, people may avoid crime due to a mix of economic incentives (to avoid being fined or jailed), moral incentives (to do what's "right") and social incentives (to be seen in a good light).

- A day-care center wanted parents to pick up their kids on time, so they levied a $3 fine for parents who were late. However, the number of late pickups actually *doubled*. That's because the fine was too affordable, sent the wrong signal that being late wasn't a big deal and removed the parents' guilt of being late. Without a moral incentive, parents continued to be late even when the $3 penalty was removed.

People cheat in order to get more for less. When the stakes are high enough, *anyone* may cheat. To prevent cheating, you must understand what people want, how they think and how they'd respond to specific incentives or disincentives.

- In 1996, "*high-stakes testing*" was introduced in Chicago public schools. Any school with low scores may be shut down and the teachers could lose their jobs. In addition, students could only move up to the next level with a minimum score on a standard test. The intention was

KEY QUOTES

"Economics is, at root, the study of incentives: how people get what they want, or need, especially when other people want or need the same thing."

"An incentive is a bullet, a lever, a key: an often tiny object with astonishing power to change a situation."

"Cheating is a primordial economic act: getting more for less."

to improve education standards, but teachers ended up cheating and inflating their students' scores to keep their jobs.

- In *sumo-wrestling*, a wrestler's ranking defines his entire career, from his income to status and treatment. So, to protect their rankings, elite sumo wrestlers in Japan ended up colluding with one another to rig or throw matches.

- *Blood donors* who were paid for their blood donations donated *less* blood than those who were merely praised. Those who were offered a big incentive (e.g. $5,000 per pint) may even resort to using fake blood to get the incentive.

? So, are most people honest on a typical day?

- Paul Feldman's bagel business sheds some light on this question. Feldman delivered thousands of bagels daily to >100 companies and returned later in the day to collect the cash basket and leftovers. By tallying the money collected against the number of bagels taken, he found that most clients were honest with their payments, and an "honest" company would have a payment rate of >90%.

- However, payment rates fluctuated due to a wide range of factors. Small offices were generally more honest than big ones (possibly due to the greater social incentives or fear of shame), and people paid more in good weather than in bad weather. During certain holiday seasons (e.g. Christmas week), theft rate increased while payment rates decreased. Yet, payment rates improved for other holidays (e.g. Labor Day) and in the aftermath of the 11 Sep 2001 terrorist attacks (when people were possibly more empathetic). Moreover, people were more likely to steal his bagels than his cash, probably due to the social stigma attached to theft, and the small amounts of money involved.

KEY QUOTES

"A thing worth having is a thing worth cheating for."

The Power of Information

Information (or the lack of it) can strongly influence behaviors and decisions. Its impact depends on who possesses it and how it's used.

"Information is a beacon, a cudgel, an olive branch, a deterrent—all depending on who wields it and how."

Information is power. Information asymmetry occurs when one party in a transaction has better information than the other party.

- The *Ku Klux Klan (KKK)* is an American hate-group that initially targeted African Americans, then Jews, Catholics, communists, immigrants, and other minority groups. It thrived in the 1860s, then the 1920s and and 1950s, operating like a terrorist group in cahoots with leaders in politics, business, and law-enforcement. After WWII, writer Stetson Kennedy sought to bring down the KKK in collaboration with John Brown. They infiltrated the KKK then made its secrets public through a novel and radio shows. Armed with specific information, Americans who opposed the KKK could now choose to take action, while those who may have embraced them were now reluctant to join/support the KKK. As a secret society, KKK's power came from its secrecy; it lost its advantage once those secrets were exposed.

- Even *assumed information* can have a big impact. A new car loses about 25% of its value overnight. The devaluation will happen even if you tried to sell the car within the next week, because people will simply assume you bought a lemon.

Many of us assume that experts (e.g. doctors, lawyers, brokers) are incentivized to act in our best interest. In reality, they exploit their informational advantage for *their* benefit, not yours.

- In theory, *real-estate agents* should get the best possible offer for your home so they can earn higher commissions. Yet, a study of real-estate sales revealed this: real-estate agents took on average 10 days longer to sell their own homes, and secured 3% higher prices compared to when they sold clients' homes. That's because an agent only earns a fraction of your home's selling price (especially if the commission is shared between buyer and seller agents). The incremental commission simply isn't worth the extra time effort required to secure the best price. For example, if you accept an offer of $475,000 instead of your targeted $500,000, the agent may earn $375 less, but he/she can close the deal quickly and move on to the next one.

KEY QUOTES

"Nothing is more powerful than information, especially when its power is abused."

"What better way to defang a secret society than to make public its most secret information?"

"Experts are human, and humans respond to incentives. How any given expert treats you, therefore, will depend on how that expert's incentives are set up."

"The point here is not that real-estate agents are bad people, but that they simply are people—and people inevitably respond to incentives."

- In extreme cases, experts may even use information asymmetry to commit crimes, hide true information or promote false ones. Such "*sins of information*" include the Enron scandal in the early 2000s, and how WorldCom and Global Crossing fabricated revenue figures to increase stock prices.

- The *internet* has partially levelled the playing field by reducing the information gap between the experts and the public. For example, the price of term life insurance fell drastically after users could compare policy prices online. You can now find information on almost anything online instead of relying solely on salespeople's or experts' inputs.

- Even with the internet, experts can still use information asymmetry to *play on your fears*, e.g. fear of losing out or making a wrong choice if you don't follow their advice. They count on you (i) having less information and not knowing what to do with the information, and/or (ii) respecting their expertise enough not to challenge them.

In reality, everyone abuses information, not just experts.

- All of us *present selective information* about ourselves, e.g. portraying our best front during an interview or a first date. Often, we're unaware that we're doing so.

- Studies of TV variety programs and dating apps found that people *discriminate* against others based on their race, gender, income levels etc. This could be due to personal tastes/preference or assumed information (e.g. biases and stereotypes about certain races or genders).

The Fallacy of Conventional Wisdom

Most conventional wisdoms are actually wrong. You can ask good questions about things people care about to uncover underlying truths, overturn conventional wisdoms and create a huge impact.

Economist John Kenneth Galbraith coined the term "conventional wisdom" to describe notions that reinforce people's self-interests, self-esteem and well-being. In

KEY QUOTES

"One characteristic of information crimes is that very few of them are detected. Unlike street crimes, they do not leave behind a corpse or a broken window."

"Armed with information, experts can exert a gigantic, if unspoken, leverage: fear."

"If you can question something that people really care about and find an answer that may surprise them—that is, if you can overturn the conventional wisdom—then you may have some luck."

short, conventional wisdoms may be "simple, convenient, comfortable, and comforting" but they're also usually wrong.

- Many conventional wisdoms come from *news media and advertisements* since they use jarring "facts" to grab attention.

  (i) In the 1980s, Mitch Snyder—an advocate for the homeless—claimed that about 3 million Americans were homeless, a shocking figure that meant 1 in every 100 Americans were homeless. Later, he admitted that he'd fabricated the number under pressure from the journalists. Unfortunately, it's not uncommon for "experts" and advocates to inflate numbers to win support for their cause.

  (ii) Likewise, no one paid much attention to bad breath until Listerine was marketed as the solution for "chronic halitosis". Since then, halitosis was seen as a real medical concern.

KEY QUOTES

"Working together, journalists and experts are the architects of much conventional wisdom."

"A little creative lying can draw attention, indignation, and—perhaps most important—the money and political capital to address the actual problem."

Regardless of the source and accuracy, conventional wisdom is hard to change once it's created. The authors spend the bulk of one chapter showing that drug dealing (especially crack dealing) is not as profitable as we've been led to believe.

- In 1989, a university undergraduate in Chicago, Sudhir Venkatesh, got to know members of the Black Gangster Disciple Nation while doing surveys in the district. Intrigued by how they operated, he practically lived with them for 6 years to study them and even got access to 4 years' records of the gang's financial transactions. Later, Venkatesh collaborated with Levitt to analyze the data and present a paper on the gang's operations.

- As it turns out, a gang is organized like any business, especially an established franchise like McDonalds. Each gang is merely a branch/franchise of a larger organization run by a board of directors. Each gang pays a percentage of revenues for the right to sell crack in a designated area. The gang leader is supported by officers (e.g. enforcer, treasurer, runner) who manage the remaining foot soldiers.

- Like any other capitalist enterprise, only a small proportion of people at the top of the pyramid make lots of money. In the gang that Venkatesh studied, the leader earned $66 per hour, but the officers only earned $7 an hour while the foot soldiers earned $3.30 an hour (below minimum wages).

- So, how did we get the impression that crack dealing is so lucrative? That's partially due to the stories spun by the police to justify how hard it is to fight against drug dealers armed with advanced weapons and deep pockets.

In the end, wages in any profession are determined by 4 factors: (i) the number of people available to do the job, (ii) the specialized skills required, (iii) the unpleasantness of a job, and (iv) the demand for the services.

- Crack dealing pays poorly like most *glamour professions* (e.g. sports, movies, music, and fashion) where lots of people compete for a few prized spots. You must start at the bottom, work hard at substandard wages, and consistently deliver outstanding performance to make it to the top. Criminals respond to incentives like everyone else, and are willing to slog it out for a chance to win big.

- By contrast, an average *prostitute* earns more than an average architect because few people aspire to become a prostitute, the skills are applied in a highly-specialized context, the job is unpleasant and there's a high demand for their services.

The authors also looked at what crack cocaine has in common with nylon stockings.

- Before nylon stockings were invented, silk stockings were only affordable for the high-class. Nylon stockings basically made this classy item available to the masses.

- Likewise, cocaine used to be considered a classy drug used exclusively by the rich and famous. However, crack cocaine could be produced with tiny amounts of cocaine, making the drug affordable to the masses and leading to the crack boom.

KEY QUOTES

Uncovering Distant, Unexpected Causes

Small, indirect and remote causes can trigger huge, unexpected outcomes. To understand and simplify our complex world, you must know what to measure and how to do it. The authors explain how they used data to filter out the facts vs myths of crime.

In 1966, Romania's Communist dictator Nicolae Ceaușescu made abortion illegal in order to boost Romania's population. Within 1 year of the ban, Romania's birth rate had doubled, but with unexpected consequences. As a cohort, children born after the ban did worse in all areas compared to those born a year earlier—they scored lower in school, had less success at work and were more likely to resort to crime. In fact, Ceaușescu himself was overthrown (and eventually killed) due to the revolt by young people who wouldn't have been born if not for his ban on abortion.

In the 1990s, crime rates in the U.S. started to drop drastically after a period of increase. Experts struggled to explain *why* this happened. Levitt reviewed 8 of the most-cited explanations, and showed that only 3 of them contributed to the decrease in crime. In fact, the #1 reason for the fall in crime wasn't even mentioned in the newspapers.

- A *strong economy* (and a stronger job market) wasn't really correlated with crime rates. In any case, it would at most affect money-motivated crimes (e.g. theft, burglary, robbery) and not violent ones (e.g. homicide, assault, rape).

- More *imprisonments* accounted for roughly one-third of the drop in crime, but still left two-thirds unaccounted for. On the other hand, *capital punishment* didn't really affect crime rates since it rarely happened and would account for at most one twenty-fifth of the drop in homicides.

- An increase in the *number of police* did significantly reduce crime rates, but *innovative policing strategies* (e.g. smart policing or cracking down small crimes to prevent bigger ones) didn't.

KEY QUOTES

"Dramatic effects often have distant, even subtle, causes."

- The *availability of guns* did explain the relatively high homicide rate in the U.S. Yet, guns alone can't be the main explanation since Switzerland is one of the safest places in the world despite having the highest firearms-per-capita compared to other countries. Levitt presents data to show why various gun laws haven't been effective in crime reduction. The *bursting of the "crack bubble"* also contributed to the drop of crime, since profits for dealing crack had become so low that fewer dealers were interested in the job.

- Data analysis also showed that an *aging population* had no influence on crime rates.

The biggest contributor to the drop in crime actually came from a development 20 years ago—the legalization of abortion. From the late 1960s, abortion was progressively legalized in various U.S. states before it was legalized in the whole country in the 1973 Roe v Wade judgment.

- An analysis of the correlation between each state's abortion rate and crime rate showed that:

  (i) States with the highest abortion rates in the 1970s experienced the greatest crime drops in the 1990s, whereas those with low abortion rates had smaller crime drops; and

  (ii) For states with high abortion rates, the entire drop in crime happened mainly in the post-Roe cohort.

- In short, legalized abortion led to less unwanted babies growing up in unconducive environments, which led to less crime. Studies in Australia and Canada found a similar link, and we'd seen a similar impact in Romania in the example earlier.

- It may be more comforting to believe that the decrease in crime was due to factors like brilliant policing or law changes. However, the data tells a different story: legalized abortion had a bigger impact on reducing crime rates than other factors cited.

KEY QUOTES

"The very factors that drove millions of American women to have an abortion also seemed to predict that their children, had they been born, would have led unhappy and possibly criminal lives."

Being the Perfect Parent

Many parents are obsessed about doing the right things to ensure their children's success. However, data suggests that the things parents *do* matter less than who/what they *are*.

Experts often play on parents' fear for their children, especially their safety. Generally, we're bad at risk-assessment: we over-react to things that scare us and under-react to things that kill us.

- According to Peter Sandman, people tend to evaluate risks based on the *"outrage" factor* more than the actual hazard itself. Things that're beyond our control tend to trigger more outrage. That's why mad-cow disease seems more scary than the spread of food-borne pathogens in our kitchen, even though the latter is much more common. People also tend to fear flying more than driving, when the per-hour death rate is similar for both modes of transport. We're also more afraid of immediate risks than long-term risks.

- Parents are more afraid to let their kids go to a house with a gun than one with a swimming pool, when a child is 100x more likely to die in a pool than get killed by a gun. We can save more children's lives by focusing on the *real, controllable risks* (e.g. taking swimming pool precautions) instead of the scary ones (e.g. buying expensive car seats).

Every parent and "expert" has different advice on the best way to parent a child, and such advice tends to contradict one another.

- Many studies suggest that *genes* influence about 50% of a child's abilities and personality. What about the other 50%? And, should successful parenting be measured by the child's personality, morality, creativity, school grades, adult income or other factors?

- The 1990s Early Child Longitudinal Study (ECLS) by the U.S. Department of Education measured the *academic progress* of >20,000 students from kindergarten to fifth

KEY QUOTES

"No one is more susceptible to an expert's fearmongering than a parent...The problem is that they are often scared of the wrong things."

grade. By using regression analysis, you can examine the impact of 1-2 variables whilst holding the other variables constant to glean valuable insights.

(i) The gap in test scores between black and white students was eliminated once you exclude the impact of their parents' income and education level, and the mother's age when she had her first child. In fact, black students in good schools performed better than white students in poor schools.

(ii) 8 factors that strongly affect academic performance are: the parents' education level, socioeconomic status, involvement in the PTA, the mother's age when she had her first child, the language spoken at home, the child's birthweight, whether the child was adopted, and whether the child has many books at home.

(iii) 8 factors that didn't matter were: whether the family is intact, whether they moved to a better neighborhood, whether the mother stopped working when the child was born, whether the child attended Head Start, whether the child was spanked frequently or watched TV regularly, and whether the parents read to the child regularly or brought the child to museums.

- These results suggest that *parents matter, but not in the way people think*. Parenting practices matter much less than the circumstances the child is born into, i.e. who the parents are and the lives they lead.

KEY QUOTES

"It isn't so much a matter of what you do as a parent; it's who you are."

Names and Life Outcomes

Does the name given to a child affect his success or failure in life? Data shows that names are *correlated* with (but do not determine) people's life outcomes.

The names that parents choose for their children reflect their own status and expectations for the child, but those expectations may not always be fulfilled. In 1958, a man Robert Lane named his baby son "Winner". Three years later, he named his next son "Loser" (for reasons unknown). Decades later, Winner had a long criminal record while

"People who can't be bothered to come up with a name for their child aren't likely to be the best parents either."

Loser was moving up the ladder in the New York Police Department. It seems that the boys' lives didn't play out according to their names. In fact, people avoided calling Loser by his real name and used alternative names like "Jimmy" or "Lou".

In the study of black culture, economist Roland Fryer Jr. found that black and white names are distinctly different. To investigate whether people's names affect their life outcomes, he dove into California's extensive birth-certificate database, which allowed him to trace the background of the parents as well as how each child turned out decades later.

- He found a clear divergence between black and white names since the 1970s. The blacks gave their children unique names whereas the whites tended to use more common names. The "whitest" names included names like Molly, Amy, Jake, and Conner. The "blackest" names included names like Imani, Ebony, DeShawn, and DeAndre.
- On average, someone with a distinctively black name will do worse in life than someone with a distinctively white name. First, the names are a reflection of the parents' socioeconomic status. Those with distinctively black names tend to come from low-income, low-education, single-parent backgrounds, and often get stuck in that cycle. Second, a black-sounding name comes with an economic penalty. When researchers send 2 fake resumes to prospective employers—which are identical except for the difference in names—the "white" resumes always get more job interviews than those with an immigrant or minority-sounding name.

In addition, when the babies' names are sorted by the parents' socioeconomic status, a clear disparity emerged between names given by low-income, middle-income, and high-income parents (and also for parents with high-education vs low-education). A pattern emerged: as certain names become popular among high-income, highly-educated families, they start to trickle down the socioeconomic ladder, until the name becomes so common that it loses its popularity. In short, (a) people are more likely to name their children after a well-to-do neighbor

KEY QUOTES

"[Your] name is an indicator—not a cause—of [your] outcome."

than a famous celebrity, and (b) you can predict the most common baby names 20 years later by studying the baby names that are currently the most popular among the upper-class.

Conclusion and Other Details in the Book

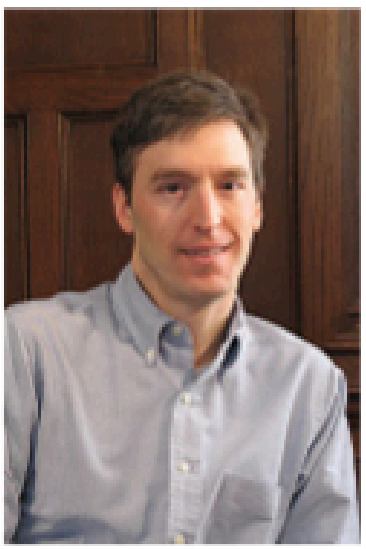
The main message of this book is to look beyond conventional wisdom and rose-tinted lenses of what we wish or imagine the world to be. By asking lots of questions and analyzing facts/data in detail, you can start to figure out what's truly going on. Bear in mind that in most cases, even with regression analysis, you can only prove strong statistical correlation but not causality.

In the book, the authors provide much more details of the various examples and ideas outlined in this summary. The 2006 revised and expanded version of this book also includes additional articles and blog entries. For more details and resources, please visit freakonomics.com.

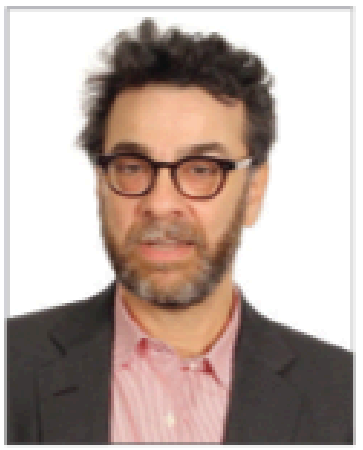
KEY QUOTES

"If morality represents an ideal world, then economics represents the actual world."

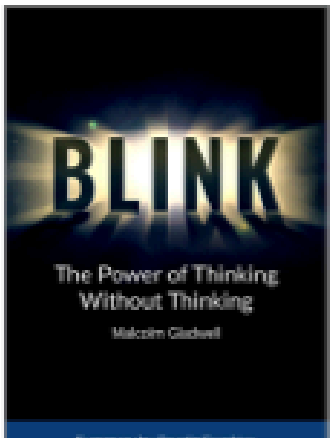
About the Authors



Steven David Levitt (born 1967) is an American economist and author. He was the winner of the 2003 John Bates Clark Medal for his work on crime, and is currently the William B. Ogden Distinguished Service Professor of Economics as well as the Faculty Director and Co-Founder of the Center for Radical Innovation for Social Change, both at the University of Chicago. He's also a co-founder of consulting firm TGG Group.



Stephen Joseph Dubner (born 1963) is an American author, journalist, and podcast and radio host (of Freakonomics Radio). He graduated from the College of Fine and Applied Arts at the Appalachian State University in North Carolina, and earned a Master of Fine Arts in Writing from Columbia University, where he also taught English.



BLINK

The Power of Thinking Without Thinking

Malcolm Gladwell

The Big "So What"

Have you ever wondered how you make snap decisions? In this book, Malcolm Gladwell uses scientific research, anecdotes, and expert insights to unveil the power and pitfalls of intuitive judgment. He explains how we use "thin-slicing" to gauge a situation rapidly, and offers tips to improve the quality and accuracy of our decisions.

Introduction

The book opens with a story that shows how instinctive, snap judgments can be as good as logical, deliberate analysis.

- The Getty Museum in Los Angeles was about to purchase a kouros, an ancient Greek statue. There were only about 200 kouros known to exist, making this a rare and valuable artifact. The museum experts did a comprehensive authenticity check over 14 months, using various scientific tests to analyze the material and age of the statue—and concluded that it was authentic.

- Yet, when art historians and experts saw the kouros, many instantly sensed that something wasn't right. True enough, further investigations revealed inconsistencies that suggested the kouros might indeed be a counterfeit. How did the experts detect the problem in just seconds or minutes, when the museum team had failed to do so after months of detailed analysis?

In this book, Gladwell emphasizes the importance of trusting our instincts, with 3 key messages:

- *Snap judgments can be as effective* as those made from lengthy deliberations.

KEY QUOTES

"Decisions made very quickly can be every bit as good as decisions made cautiously and deliberately."

- Our instincts can sometimes mislead us. Gladwell speculates that the Getty Museum team might have been so eager to acquire the kouros that they overlooked their own instincts. It's important to *know when to trust your instincts* (and when not to).

- With awareness and focused training, *you can enhance your intuitive decision-making*.

This summary is presented in 2 key sections:

- The powers and pitfalls of snap judgments; and
- How to improve intuitive decision-making

Part 1: The Power and Pitfalls of Snap Judgments

Thin-Slicing: How We Glean Insight from Limited Information

"Thin-slicing" refers to our innate ability to discern patterns and draw conclusions from minimal data. Such conclusions can be as accurate (or even more so) than those made from comprehensive analyses.

Gladwell shares several examples to illustrate how we can glean a lot from very little.

- *Predicting relationship success*: Psychologist Dr. John Gottman runs a "Love Lab" where he conducts extensive research on couples. Gottman can observe a couple for just 15 minutes and predict with 90% accuracy if they'd still be married 15 years later. The accuracy goes up to 95% after a 1-hour session.

  (i) Gottman's skill is like *decoding Morse Code*. To the untrained eye, the codes look like random dots and dashes. But experts can easily decipher the messages, and even identify a sender by the rhythm of the codes (just like voice recognition).

  (ii) Having studied thousands of couples, Gottman can translate their interactions into "emotional dots and dashes." He can intuitively sieve through their words,

KEY QUOTES

"Our unconscious is a powerful force. But it's fallible."

"Just as we can teach ourselves to think logically and deliberately, we can also teach ourselves to make better snap judgments."

"Predicting divorce, like tracking Morse Code operators, is pattern recognition."

"Morse code is like speech. Everyone has a different voice...We have to listen to only a few characters to pick out an individual's pattern."

expressions, and reactions, to diagnose the state of the relationship. However, he doesn't try to read all the communication cues. He only zeroes in on 4 critical signs that predict relationship problems: criticism, contempt, defensiveness, and stonewalling.

- *Understanding personalities through living spaces*: Psychologist Samuel Gosling ran an experiment, where he had students evaluate their peers on 5 personality traits: extraversion, agreeableness, emotional stability, conscientiousness, and openness to experiences.

  (i) One set of evaluation was done by close friends, while another was done by strangers who merely studied the subjects' dorm rooms. The results were compared against the subjects' self-evaluations.

  (ii) The strangers more accurately predicted 3 of the 5 traits compared to the subjects' close friends. That's because our living spaces reflect our habits and preferences. The strangers could pick out these cues without being distracted by other irrelevant cues such as the subjects' looks or mannerisms.

Thin-slicing is a natural instinct. You assess new people and situations all the time, and you're generally good at it. The key is to eliminate irrelevant details and zoom in on the few things that really matter (elaborated below).

The Locked Door: Why We Can't Explain Our Intuition

The adaptive unconscious refers to the rapid-response system in our brain. It processes vast amounts of data without our conscious awareness, and makes split-second decisions based on past experiences and instincts.

- *We're not fully aware of the reasons* behind our snap judgments. It's like part of our mind is kept behind a locked door. It's always at work, yet we're not conscious of its workings. For example, tennis coach Vic Braden could predict when a player was about to serve a double fault, yet he couldn't explain how he knew.

Even when we think we understand our choices, our explanations may not reflect reality.

KEY QUOTES

"It is quite possible for people who have never met us and who have spent only twenty minutes thinking about us to come to a better understanding of who we are than people who have known us for years."

"Sometimes we're better off if the mind behind the locked door makes our decisions for us."

- We might think we're doing one thing, when we're actually doing something else. For instance, baseball player Ted Williams could confidently explain how he played so well. Yet, slow-motion footage revealed that *his actions didn't match his descriptions*.

- During *speed dating*, participants meet a series of potential romantic partners in quick succession. They can decide within minutes if they'd like to see that person again, yet they find it hard to explain their choices. Often, they may choose partners who're different from their stated criteria, because they don't know the criteria being used by their unconscious mind.

We think that we're acting from our own free will, when our behaviors are often influenced by subtle cues around us.

- *The power of priming*: In an experiment, participants were asked to form sentences from words. One group was given words associated with politeness (e.g. "yield," "patient," "respect"), while the other was given words associated with rudeness (e.g. "intrude," "aggressive," "rudeness"). The participants primed with rudeness later interrupted a researcher while he was engaged in a discussion, while those primed with politeness waited patiently without interrupting.

- In another experiment, participants were challenged to tie 2 ropes dangling from the ceiling. The ropes were positioned far apart, so you can't reach both ropes at the same time. Many were stumped until the tester discreetly made one rope swing, hinting at the solution—to swing 1 rope while holding the other, then grab the swinging rope on its return swing and tie the 2 ropes. When the participants were asked to explain how they came up with the answer, almost all of them came up with some logical explanation. They didn't realize how their unconscious mind had picked up on the *subtle hint* to arrive at the answer.

- In short, we make unconscious, split-second decisions without knowing why. When our conscious mind tries to rationalize these decisions, *we end up creating stories that might be untrue*.

We live in world that demands hard facts and evidence, and we're often expected to explain how we arrive at our

KEY QUOTES

"Our unconscious reactions come out of a locked room, and we can't look inside that room."

"We have, as human beings, a storytelling problem. We're a bit too quick to come up with explanations for things we don't really have an explanation for."

"We need to respect the fact that it is possible to know without knowing why we know and accept that—sometimes—we're better off that way."

conclusions or decisions. Such attempts to rationalize our choices can lead to misleading narratives. Gladwell believes that it's sometimes better to trust our instincts, and to accept that snap judgments can be valid even if we can't explain them.

The Warren Harding Error: The Pitfalls of First Impressions

Snap judgments are powerful, but our first impressions can be misleading due to unconscious biases and flawed assumptions. The "Warren Harding Error" is named after Warren G. Harding, the 29th U.S. president.

- Harding was elected largely because of his appearance. He *looked* like a leader—with his tall stature, commanding presence, and distinguished facial features—so much so that people overlooked his lack of skills and experience in governance and leadership. Unfortunately, *appearances can be deceptive*, and Harding turned out to be one of the worst presidents in American history.

- This error isn't limited to politics. A disproportionate number of Fortune 500 CEOs are tall, pointing to our tendency to *associate height with leadership*, even though there's no factual basis for it.

Our attitudes operate on 2 levels: conscious and unconscious. Our conscious attitudes are the stated values that we use intentionally to guide our behaviors. Our unconscious attitudes are the automatic associations and judgments that we form unknowingly.

- No matter what your stated beliefs are, your actions and decisions are *influenced by your unconsciously beliefs/attitudes*. For example, if you value equality but are unconsciously biased toward people of color, you may spontaneously lean away from them or avoid eye contact.

- You can uncover your hidden biases using the *Implicit Association Test (IAT)*. This psychological tool measures the automatic connections that you make between 2 things.

  (i) Participants are asked to link a series of positive or negative words with specific categories like race or gender. The faster you link 2 words, the stronger their

KEY QUOTES

"We...have to acknowledge and understand those circumstances when rapid cognition leads us astray."

"We don't deliberately choose our unconscious attitudes... we may not even be aware of them."

"Being short is probably as much of a handicap to corporate success as being a woman or an African American."

association in your mind. For example, millions of Americans subconsciously link the words "evil" and "criminal" with "African American."

(ii) The unconscious attitudes revealed by the IAT are often different from our expressed beliefs, and it is our unconscious attitudes that drive our spontaneous/ unplanned reactions.

Such biases have a real-world impact. In a study, testers of varying races and genders were tasked to visit car dealerships to negotiate car prices. They dressed similarly and were equipped with the same negotiation script. Yet, white men consistently received the best price offers, while females and minorities received less favorable terms.

- Although our biases operate beneath our consciousness, *we're not entirely helpless* against them. For example, car salesman Bob Golomb deliberately treats every customer the same way, regardless of their background or appearance. He gives everyone a fair and consistent price instead of second-guessing how much they would be willing to pay. This unbiased approach has earned him the loyalty of his customers and helped him to outperform his peers consistently.

Limitations of Market Research in Consumer Preferences

Consumer decisions are complex and multi-faceted, and people often can't explain their unconscious choices. Thus, market research is often unreliable in predicting consumer preferences.

- In the early 1980s, Coca-Cola was losing market share steadily to Pepsi. Pepsi's ads showed people choosing Pepsi over Coke in a blind taste-test. So, Coke launched "*New Coke*" with a sweeter taste similar to Pepsi's. Blind tests confirmed that people preferred the taste of New Coke over the original. Yet, New Coke failed to take off, and Coca-Cola was forced to bring back the Classic Coke. Meanwhile, Pepsi never overtook Coke as the market leader. What can we learn from this example?

  (i) The blind tests involved just a sip of the drink, which didn't reflect actual consumption patterns. People may

KEY QUOTES

"Our first impressions are generated by our experiences and our environment, which means that we can...alter the way we thin-slice...by changing the experiences that comprise those impressions."

prefer Pepsi's sweeter taste in 1 sip, but find it overpowering when they finish a whole bottle.

(ii) Consumer preferences for Coke went beyond taste—purchase decisions are also influenced by brand loyalty, cultural perceptions, product packaging, etc. Feedback on 1 aspect of the product may not predict purchase decisions.

- Specifically, Louis Cheskin found that consumer preferences are influenced by many factors besides product quality. These include: *packaging, brand expectations, and context*. For example:

(i) Margarine became more popular after he changed its color from white to yellow and wrapped it in foil, so it resembled butter.

(ii) When brandies were decanted into plain bottles, people could no longer differentiate between premium and normal brands.

Our first impressions may not reflect our long-term preferences. This is especially true for ground-breaking products that we're unfamiliar with: we may claim to hate the product when we're simply unused to it.

- Take the Aeron Chair for example. It was introduced in the '90s by Herman Miller, with a radically different design from office chairs of that era. The chair was meant to be aesthetically pleasing and ergonomically superior, yet feedback from market research was discouraging. Many people found it strange or ugly, and most didn't see it as a luxury chair.

- Miller launched the Aeron Chair regardless. Initially, reception was lukewarm, but its popularity grew as people began to appreciate its ergonomic benefits and aesthetic appeal. The Aeron Chair eventually became a symbol of status and modern innovation, and was even displayed at the Museum of Modern Art.

Simple preferences can also become distorted by over-analysis.

- Often, consumers cannot explain their subconscious choices. When they're asked to explain their preferences or assess

KEY QUOTES

"The mistake Coca-Cola made was in attributing their loss in share to Pepsi entirely to the product. But what counts for an awful lot in colas is the brand imagery, and they lost sight of that."
—William Rhea

"It is the new and different that is always most vulnerable to market research."

specific qualities (e.g. texture, rhythm, aesthetics), they may over-think and invent narratives that don't reflect their true preferences.

- For example, when people were asked to taste and rank different jams, their rankings were closely aligned with experts' opinions. But, when they were asked to explain why they liked/disliked the jams, their rankings became different from the experts'.

Part 2: Improving Intuitive Decision-Making

Structured Spontaneity: Balancing Intuition and Analysis

Snap judgments and spontaneous actions may seem random, but they're actually built on past experiences, learning and practice.

To make effective snap decisions, you need the right blend of intuition and analysis.

- Specifically, apply deliberate thinking (which is slow and thorough) and intuitive thinking (which is fast and adaptable) in the *right contexts and combination*:

  (i) Use deliberate thinking when there's a clearly-defined task, ample time, and suitable tools for analysis. Then, use the results of the detailed analysis to create a *structure for intuitive thinking*.

  (ii) Don't try to use logical thinking/analysis to explain something visual or intuitive (e.g. dance moves or solutions to complex/creative problems). When we describe something in words (a left-brain activity), it can interfere with our visual/intuitive ability (a right-brain function). That's why you can easily recall your friend's face, yet you struggle to describe it in words.

- In 2002, the U.S. Department of Defense organized a war game called the *Millennium Challenge* to simulate a confrontation between the U.S. and a smaller rogue state.

KEY QUOTES

"Spontaneity isn't random.... How good people's decisions are under the fast-moving, high-stress conditions of rapid cognition is a function of training and rules and rehearsal."

(i) The U.S. forces were represented by the Blue Team, which was equipped with sophisticated computer systems and databases to analyze enemy data and possible strategies. The rogue state was represented by the Red Team, which was led by a retired Marine (Paul Van Riper) who relied mainly on experience and gut instincts to lead his team.

(ii) Despite the Blue Team's advance technology, they were outmaneuvered by the Red Team. Van Riper and his team did their analyses *before* the battle, then relied on their instincts and combat experience to respond nimbly during the battle. By contrast, the Blue Team was constantly analyzing and debating their strategies; getting so lost in the details that couldn't tap on their intuition.

- A similar pattern can be found in *improvisational (improv) comedy*. Performers step onto the stage without a pre-defined role or a script. They come up with material on the spot (or even take suggestions from the audience) to improvise as they go.

(i) Improv seems entirely spontaneous, but it operates on established rules that enable performers to react swiftly on stage. One foundational principle is the "Yes, And..." rule: when a performer introduces an idea, others must accept and build on it, so the scene can progress smoothly and organically.

(ii) The actors rehearse the rules so frequently that they become deeply-ingrained and can be applied intuitively during a performance.

Too much information can hinder decision-making. Be frugal with your use of information: **identify and focus only on the essential factors**, so you don't get bogged down by irrelevant data.

- Remember: thin-slicing is not about making decisions with insufficient data. It is about making decisions with the *right data*, however minimal.

- For example, the Cook County Hospital was overwhelmed by the sheer number of potential heart attack patients arriving at their Emergency Department. They couldn't admit every patient for further tests, yet they couldn't risk sending patients home if they were truly suffering from a heart attack.

KEY QUOTES

"They were so focused on the mechanics and the process that they never looked at the problem holistically. In the act of tearing something apart, you lose its meaning."
—Paul Van Riper

"When we talk about analytic versus intuitive decision making, neither is good or bad. What is bad is if you use either of them in an inappropriate circumstance."
—Paul Van Riper

"Snap judgments can be made in a snap because they are frugal, and if we want to protect our snap judgments, we have to take steps to protect that frugality."

"You need to know very little to find the underlying signature of a complex phenomenon."

Based on extensive research, Dr. Brendan Reilly developed a simple decision tree for *identifying heart attack patients*, using only 4 critical factors: ECG readings, pain from unstable angina, fluid in the patient's lungs, and systolic blood pressure. This proved to be 70% more effective than the original methods. In short, less can be more.

Making Decisions Under Stress or Trauma

Stress can cloud our intuition. When we jump to hasty conclusions in tense or high-stress situations, it can lead to disastrous results.

- In 1999, Amadou Diallo—a West African immigrant—was *tragically killed* by police officers in New York. Diallo was taking a walk outside his apartment building when he encountered 4 police officers. The officers started shooting when they thought Diallo was drawing a gun, when he was just reaching for his wallet. In another incident, college football player Robert Russ was shot by a Chicago police officer during a traffic stop. How did these happen?

- Under normal circumstances, most of us can "read" others' intentions and emotions through their *expressions and micro-expressions*. Psychologists Silvan Tomkins and Paul Ekman developed the Facial Action Coding System (FACS) which documents a myriad of human emotions expressed through a combination of facial-muscle movements, including subtle, fleeting micro-expressions.

- However, people with disorders (e.g. autism) may suffer from mind-blindness, i.e. they find it hard to discern others' emotional states. When normal people encounter high-stress or life-or-death situations, they may also develop *temporary mind-blindness* (or what Gladwell calls "temporary autism"). Time seems to stand still, and we may experience tunnel vision or temporary deafness as the body zeroes in on the threat and blocks out all other signals. For a time, we lose our ability to read others' intentions or emotions.

- We also need "*white space*", or a moment to effectively read or respond to others. In intense scenarios, we might rush to conclusion, worsening the effects of temporarily mind-blindness.

KEY QUOTES

"There is enough accessible information on a face to make everyday mind reading possible."

"I think that we become temporarily autistic…in situations when we run out of time."

Fortunately, we can train ourselves to respond more effectively in times of extreme stress.

- Our *heart-rate* increases with our stress levels. According to Lt. Col. Dave Grossman, we perform optimally in stressful situations when our heart rate is between 115-145 beats per minute. Beyond 145, our cognitive abilities start to decline. Past 175, our mental capabilities are comparable to animals'.

- The military and police forces often use *simulations* to train people to handle high-pressure situations. For instance, trainees may panic when they're first shot by a plastic capsule. But after repeat hits, they're usually able to continue operating in a relatively calm manner.

We can also control our environmental cues to influence our unconscious attitudes/beliefs. For example:

- Some police departments are shifting toward *one-officer patrols*. That's because solo officers are more likely to slow down to assess the situation cautiously, and seek backup rather than rush into a situation.

- The world of orchestra used to be dominated by men, since it was widely believed that women lacked the physical abilities to play as well as men. This changed with the introduction of *blind auditions*: when musicians play behind a screen, judges must assess them purely by the quality of music. This removes visual biases associated with age, race, gender, or appearance.

- People who displayed unconscious racial biases in IAT tests saw an improvement when they took the tests after engaging with positive representations of minority groups (e.g. watching the Olympics or reading about minority leaders). By interacting regularly with diverse types of people, you can *recalibrate your unconscious beliefs*.

Other Details in the Book to Look Out For

This book is packed with detailed stories, examples, and research to help us understand the power of and pitfalls of our intuition, and how

KEY QUOTES

"With experience we become expert at using our behavior and our training to interpret—and decode—what lies behind our snap judgments and first impressions."

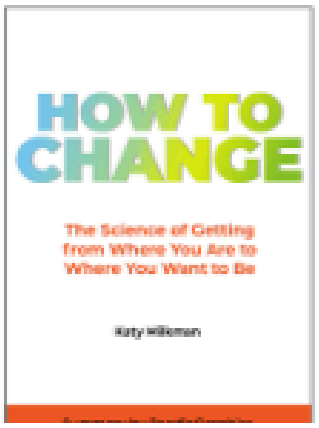
"If we can control the environment in which rapid cognition takes place, then we can control rapid cognition."

we can improve our rapid cognition to make better decisions in all areas of life. You can visit www.gladwellbooks.com for more details, visit www.implicit.harvard.edu for take various IATs for free.

About the Author

Malcolm Gladwell is an author, journalist, and public speaker. He has written for The Washington Post and The New Yorker and previously received the National Magazine Award for profiles. Gladwell has written several books, including New York Times bestsellers The Tipping Point and Outliers. In 2005, Gladwell was named among TIME magazine's 100 most influential people.

KEY QUOTES



HOW TO CHANGE

The Science of Getting from Where You Are to Where You Want to Be

KATY MILKMAN

The Big "So What"

Making changes can be hard. In this book, Katy Milkman identifies specific strategies to help you overcome key obstacles to change. By tailoring your strategies to your circumstances, you can successfully build new habits and achieve your goals.

Introduction

In 1994, tennis professional Andre Agassi was feeling frustrated by his under-performance. His new coach Brad Gilbert pointed out that Agassi was trying to make every shot a perfect killer shot, but ended up losing confidence each time he failed to knock out his opponent. Under Gilbert's coaching, Agassi adopted a different approach—to analyze and target his opponents' specific weaknesses. This fueled his resurgence to become the first unseeded tennis player in 28 years to win a U.S. Open trophy.

When it comes to building habits and making changes, many of us make a similar mistake. We try to adopt a one-size-fits-all approach, when it's much more effective to tailor your strategies to your specific challenges and weaknesses.

- In this book, Milkman combines her engineering training with insights from behavioral economics to explain how you can overcome 7 key obstacles to make any change you desire.

KEY QUOTES

"One-size-fits-all strategies won't get you nearly as far as tailored attacks on what stands in your way."

"You can use an all-purpose strategy that works well on average…But you'll get further faster if you customize your strategy: isolate the weakness preventing progress, and then pounce."

"When it comes to changing your behavior…your opponent is inside your head."

Overcoming the Obstacles to Change

1. Not Getting Started

Often, we fail to change or achieve our goals because we don't even get started. We may find it hard to break our current routines/habits, or we may lack the belief that we can succeed in the first place.

An ideal time to change is just after a fresh start.

- We tend to think of time in terms of *life episodes* (e.g. college years, working life, new parent) instead of a continuum. We assign labels to each new chapter (e.g. accounting, consulting, freelancer) which shape how we behave.

- From their research, Milkman and her colleagues uncovered the *fresh start effect*: people are more likely to do something new or different at the start of new chapters or milestones. For example, in a campaign to help non-savers to save money, they found that people were 20-30% more likely to start saving at a later milestone (e.g. after their next birthday or the start of spring), than to start saving at an arbitrary future date.

- Fresh starts increase our motivation to change because we feel like we're *starting from a clean slate*. Our past failures seem distant, we feel like a new person and feel more optimistic about the future. So, to begin the change process, start by looking for fresh start opportunities. These could come in the form of:

  (i) *Calendar dates* that mark new beginnings, e.g. a new year/week, birthdays, anniversaries;

  (ii) *Meaningful life events*, e.g. surviving a health crisis, moving to a new country; or

  (iii) *Resets*, e.g. starting again from a blank slate, or resetting your performance scores.

However, there's an important caveat. While fresh starts can trigger positive change, they can also disrupt your progress if you're already on the roll.

KEY QUOTES

"When we hope to change, we have an opportunity to try reshaping our environment to help us disrupt old routines and ways of thinking."

- When Major League Baseball (or MLB) players are traded across leagues mid-season, their statistics for the season are reset, However, the statistics are not reset for trades within leagues. One of Milkman's PhD students analyzed 40 years of MLB data, and found that below-average players tended to improve after a statistical reset, whereas above-average players tended to do worse after a reset (since they must rebuild their records from scratch).

- Similar outcomes were found in other performance studies: resets can help underperformers to up their game, but they can also hurt people who're already performing well.

2. Impulsivity

Impulsivity refers to the present bias, or our natural preference for activities that are instantly gratifying (e.g. having an ice-cream) over those that yield long-term benefits (e.g. going to the gym).

- *Don't rely on willpower alone* to overcome your resistance to painful or difficult activities, as you'll be fighting an uphill battle.

- Instead, make your natural instincts work for you by *redesigning tasks* to make them instantly gratifying. For example:

  (i) Psychologists Ayelet Fishbach and Kaitlin Woolley ran experiments where participants were encouraged to exercise and eat more healthy food. Those who were told to choose the most *enjoyable* activities/food did much better than those who were asked to choose the most *beneficial* activities/food.

  (ii) At Stockholm's Odenplan metro station, 66% of visitors voluntarily took the stairs (instead of elevators) after the staircase was transformed into a set of working piano keys, making it fun to walk up/down the steps.

Temptation bundling is about linking a pleasurable-but-undesirable activity with a virtuous-but-unpleasant activity.

KEY QUOTES

- This serves *2 simultaneous objectives*: reduce the time spent on temptations, and increase the time spent on valuable activities that serve your long-term goals. For example, if you dread going to the gym but love watching Netflix, then only allow yourself to watch Netflix while you're working out at the gym.

  (i) In a study, participants were given ipods with interesting audiobooks for a gym session. They were told about the benefits of temptation bundling, and instructed to return to the gym if they wanted to finish the audiobooks.

  (ii) Of these participants, some were given a free audiobook download—7% of this group still revisited the gym. For the remaining participants, the ipods were locked in the gym lockers, and 55% of this group actually revisited the gym!

- This shows that the knowledge of temptation bundling is already useful in itself, though it's much more effective if you can actually *restrict the indulgence* to prevent cheating.

You can also make an activity instantly gratifying through gamification.

- The idea is to add *game-like features* (e.g. contests, leaderboards, symbolic rewards) to make an activity fun and engaging.

  (i) This is already being used by many companies. For example, Wikipedia uses a recognition system to motivate its volunteer editors, Cisco gamified a program to help employees develop social media skills, while SAP gamified awards and badges to boost employees' sales performance.

  (ii) Gamification has even been used in clinical rehabilitation programs, e.g. using video games that simulate kayak paddling to help stroke patients recover faster.

- However, gamification only works if participants *buy in* to the game/goals, making it fun/exciting to do something they already want to do. It can backfire if people feel compelled to participate.

KEY QUOTES

"Gamification can help many of us tackle our goals, so long as we're choosing to use it to pursue goals we want to achieve."

3. Procrastination

Our present bias doesn't only cause us to prioritize instant gratification. It also leads us to procrastinate on less enjoyable tasks, including those that serve our long-term goals.

Economic principles say that, all else being equal, people will always choose to have more freedom. Yet, numerous studies have shown that (i) people may willingly restrict themselves to overcome unwanted temptations, and (ii) those who do so tend to achieve much better results than those who don't.

- In the early 2000s, about 31% of families in the Philippines were below the poverty line. The Green Bank sought to get people to save more—a goal that would benefit both the bank and their customers. They decided to try a new product: a *"locked" bank account* that offered customers the same interest rates as normal savings accounts, but prevented them from taking out the money until they reached a pre-selected date or account balance.

  (i) Surprisingly, 28% of the customers chose the more restrictive option even though the interest rates were the same as normal accounts.

  (ii) Those 28% ended up saving 80% more the following year compared to customers who chose a normal savings account.

- Dan Ariely and Klaus Wertenbroch ran an experiment to help MIT students to *complete assignments on time*. To pass the course, students had to hand in 3 papers by the end of the term. Half the students were given the option to voluntarily set *earlier* deadlines and to be penalized for each day they were late.

  (i) 68% of the students chose the restrictive option because they wanted to pace their assignments instead of waiting to finish everything only at the end of the term.

  (ii) The students who chose the self-imposed deadlines ended up submitting assignments with 50% fewer errors.

KEY QUOTES

Unfortunately, not everyone realizes how susceptible they are to temptations. "Naifs" are people who overestimate their level of self-control or willpower. On the other hand, "sophisticates" understand the limits of self-control and willpower, and use commitment devices to overcome temptation and procrastination. A commitment device is something that restricts your freedom to serve a bigger goal.

- *"Hard" commitments* involve concrete restrictions or penalties.

  (i) For example, you can put yourself on a casino's exclusion list to prevent yourself from gambling, or choose a "locked" savings account to prevent yourself from withdrawing the money until you've reached your savings goal.

  (ii) You can also create your own cash commitment device by putting money on the line. Simply set a goal and get someone to hold you accountable—if you fail to reach the goal, you'll pay your friend a penalty or contribute the money to charity.

- You can also make a public declaration as a *"soft" commitment*.

  (i) Doctors were 30% less likely to prescribe inappropriate antibiotics after they signed and displayed a formal pledge.

  (ii) You can also apply other soft restrictions, e.g. using a smaller plate to reduce the amount of food intake.

- Generally, hard commitments are more effective but less palatable than soft commitments. Make it easier to stick to your commitments by breaking down a big goal into *bite-size commitments*. For instance, you're more likely to save $3 a day than to save $1095 a year (even though both amounts are the same).

4. Forgetfulness

We may intend to do something but fail to follow through because we simply forget.

KEY QUOTES

"Many of us choose not to adopt commitment devices because we undervalue them or are naïve about how much we need them."

"If a commitment is bite-size, it appears less daunting to us, and we're more likely to stick to our word."

- A study found that 54% of registered voters in the USA said they intended to vote, but *failed to turn up* on Election Day. Health company Evive found that 70% of their clients' employees don't show up for free flu vaccinations.

- One of the most common reasons for flaking out is that *people forget*. Psychologist Hermann Ebbinghaus estimated that people forget almost 50% of what they learn within 20 minutes; they forget about 70% of what they learn within 24 hours.

Timely reminders are one of the best cures for forgetfulness.

- Reminders (such as alarms or email prompts) can reduce flaking out by about 8% on average. However, the most effective prompts should happen *just before the intended activity*.

- In a study, drivers were reminded to buckle their seat belts when they collected their vehicles from the valet. Those who received the reminder *just* as they stepped into their cars buckled their seat belts 80% of the time. On the other hand, there was no difference between drivers who were reminded a few minutes before collecting their vehicles, and those who received no reminders—both groups buckled their seat belts only 55% of the time. This shows that we can *forget a reminder* within a few minutes.

Cue-based plans are another great way to overcome forgetfulness. This is about linking a plan of action with a specific cue, i.e. "When ____happens, I'll do_____."

- A *cue* is anything that triggers your memory. It can be:

  (i) A specific date/time, e.g. 5pm on Monday;

  (ii) A location, e.g. the bus-stop outside your house;

  (iii) An object, e.g. a cup of coffee;

  (iv) An activity, e.g. stopping your alarm in the morning; or

  (v) An event, e.g. getting a pay raise.

KEY QUOTES

"There are many things we routinely forget to do in spite of having good intentions."

- Instead of saying "I'll exercise more" or "I'll save more", it's more effective to *build your plan around specific cues*. For example, "Every Monday, Wednesday and Friday at 5pm I'll go to the gym" or "When I get my salary, I'll save 5%." 62% of students who used cue-based planning achieved their holiday goals, compared with just 22% of students who using general planning.

- A *vivid, distinctive cue* (e.g. a stuffed green alien on a cash register or a purple rabbit) is much more effective in triggering recall than a generic cue (e.g. a cash register or normal rabbit).

- Cue-based plans are the most effective in cases where people *have not made detailed plans* for an event or goal. The very act of planning increases the likelihood of action because it:

  (i) Creates psychological commitment;

  (ii) Forces you to break down a vague goal into smaller, specific chunks; and

  (iii) Removes the need for in-the-moment decisions.

  For example, Evive saw a 13% increase in vaccinations just by sending letters to employees to think about and jot down the intended date and time for their free flu shot.

- To *combine cue-based plans with timely reminders*, get people to think about how, where and when they would take action, then set a timely reminder with vivid cues.

⚠ There are a couple of caveats to take note of:

- Cue-based plans only work if people already want to do something; and

- Too many cue-based plans can become overwhelming. So, (i) focus on a few key goals and (ii) use checklists if a plan gets too complex to remember.

KEY QUOTES

"The more vivid, catchy, and thus memorable the cue, the more likely it is to do its job and help us recall our plans."

"Planning forces you to do the critical work of breaking it down."

5. Laziness

It's human tendency to take the path of least resistance. We may stick to a comfortable routine even though it obstructs our goals, e.g. binge-watching TV instead of completing our MBA assignments.

The great news is, you can use laziness to your advantage. Behavioral scientists regularly use set-it-and-forget-it systems to nudge people to behave in a certain way.

- To get doctors to prescribe generic medicines, Penn Medicine added a checkbox that's set to generic prescriptions by default, so the doctors had to intentionally uncheck the box to prescribe branded medications. This simple adjustment increased generic meds prescription from 75% to 98%. People are also more likely to save if it's a *default* to contribute a portion of their salary into a savings plan unless they opt out.

However, such nudges may not work for behaviors that require a repeated decision (e.g. to exercise daily). In such cases, our existing habits will dictate our default behavior.

- Habits are formed when we're rewarded consistently—e.g. getting praises, emotional relief, or pleasure—by responding to a cue in a specific way. Once formed, our habits act like *behavioral shortcuts*, i.e. we'll perform the action automatically in response to the cue, even if the reward is removed.

- We can *drill desirable behaviors* until they become habits that we perform by default, e.g. having a healthy smoothie in the morning instead of oily bacon. In a study, participants were paid to exercise at a gym for a month. Those who were paid to exercise 8x a month continued to exercise more in the subsequent weeks compared to those paid to exercise once a month.

- However, an overly-rigid habit can backfire. To make your habits "stickier", build *flexibility* into your routine wherever possible.

  (i) Employees who were rewarded to visit the gym at a specific time were more likely to continue the routine

KEY QUOTES

"Laziness can be an asset...When laziness is properly harnessed, it can actually help facilitate change."

"Too much rigidity is the enemy of a good habit."

compared to those who were rewarded for visiting the gym whenever they liked.

(ii) However, once the schedule for the first group was disrupted, they stopped going to the gym altogether, while the flexible group continued to visit the gym at their convenience.

Unfortunately, there's no fail-safe for maintaining a habit. To build and sustain a habit, it helps to:

- *Track your behavior*, e.g. marking your activity on a calendar each time it's completed. This helps you to remember the activity, hold yourself accountable, and celebrate each successful action.

- *Aim for streaks*, i.e. a period of consistent, unbroken action. Comedian Jerry Seinfeld generates a joke daily, while founding father Benjamin Franklin tracked his success habits for 13 virtues. Avoid consecutive lapses (e.g. missing a few visits to the gym) as it can easily break a habit.

- You can also *piggyback on existing habits*, i.e. peg a new habit (e.g. journaling) to an existing, stable habit (e.g. drinking your morning coffee).

6. Lack of Confidence

Self-doubt can stop people from setting a goal or taking the necessary steps to attain them.

- When we see someone struggling, we may offer *unsolicited advice* to help them. Unfortunately, this ends up reducing their confidence to make things worse.

- Instead, it's better to *ask the other person for advice*.

Boost your confidence by giving solicited advice.

- Psychologist Lauren Eskreis-Winkler found that people were *more motivated* to achieve their goals when they were asked for advice than when they were offered advice. Milkman and her colleagues found that high school students improved their grades after giving advice to other students.

KEY QUOTES

"The most versatile and robust habits are formed when we train ourselves to make the best decision, no matter the circumstances."

"When we don't believe we have the capacity to change, we don't make as much progress changing."

- Asking people for advice is so *effective* because:

  (i) It conveys our belief in them, signals that they have something worthwhile to share and builds their confidence.

  (ii) In the process of giving advice, the other party has to consider the strategies for achieving certain goals. Since they'll feel hypocritical if they don't follow their own advice, they also become more motivated to take action.

- To create *opportunities for offering solicited advice*:

  (i) Form an advice club where members solicit help/advice from one another;

  (ii) Volunteer for a mentoring role; or

  (iii) Ask yourself: if someone were to ask you for help on the problem at hand, what advice would you give?

Manage your expectations to shape your behavior and reality.

- *Our expectations affect our outcomes* because our beliefs shape our emotions, what we focus on, how motivated we feel, and even our physiology.

  (i) Housekeepers who were told that their work was a form of exercise started to lose weight (unlike the control group which didn't receive the same message).

  (ii) People who thought they were consuming a high-fat, high-calorie milkshake felt fuller than those who thought they were consuming a no-fat, low-calorie milkshake. In reality, both groups were given the same beverage.

- Sometimes, a small mistake can lead to a *downward spiral* because we expect ourselves to keep failing. To prevent that:

  (i) Create some *allowance* when you set ambitious goals, e.g. aim to exercise daily, but allow up to 5 missed days a month for emergencies. This builds flexibility into your habits and helps you to stay confident in face of inevitable setbacks.

KEY QUOTES

"If giving advice can destroy confidence, then asking people who are struggling to be advisers....might be a better approach."

(ii) Adopt a *growth mindset* and rethink your definition of "failure". Realize that your abilities are not fixed, and every setback is an opportunity to learn and grow.

(iii) Use *self-affirmation* and focus on experiences that make you feel positive about yourself.

7. Conformity

We feel pressured to follow what others are doing because we want to fit in or we assume they know something that we don't. We're more likely to conform if (i) we feel uncertain about what to do, and/or (ii) the other person's traits or circumstances closely resemble ours.

You can turn this tendency to your advantage by surrounding yourself with people who'll influence you positively.

- Spending time around high-caliber people can expand your *capacity and perspectives*, whereas being around low achievers can do the opposite.

- Milkman's studies found that people are more likely to achieve their goals if they copy and adapt others' solutions instead of developing plans on their own. If you need ideas and inspiration for your goals, start by *emulating* the strategies and tactics of those who've already achieved what you want to achieve. You can always adjust their approach for your circumstances.

You can also influence others' behaviors by highlighting what's normal or typical, e.g. "63% of hotel guests reuse their towels to save water."

- However, social influence tactics can backfire if there's *too big a gap or difference* between achievers and non-achievers. For example, weak students who were grouped with strong students became demoralized because they felt it was impossible to bridge the gap. Employees were less likely to opt in to a savings program when they were told that most of their colleagues were already saving successfully.

KEY QUOTES

"We feel like misfits when we stand out from the crowd."

"When harnessed to help people, social norms can play a valuable role in changing our behavior for the better."

- We want to *look good in front of others* (e.g. our friends, colleagues, neighbors). So, we're more likely to do the "right thing" if we believe we're being watched.

  (i) In a study to promote green energy, homeowners were asked to sign up on a public bulletin where their neighbors could see who had (or had not) signed up. This yielded 3x more sign-ups compared to communities where the sign-ups were anonymous.

  (ii) As a rule of thumb, it's better to let people opt in to a chance to earn public praise, than to force them to do something to avoid public shaming.

- If a behavior is not yet widely-adopted, you can still leverage social influence by sharing an *upward trend*, e.g. "The number of people on the voluntary retirement scheme has doubled since last year".

- Social influence tactics work best when you focus on *tangible, instantly-achievable goals*. So, break down a big goal into small, achievable goals, and use social norms to encourage people to sustain their efforts.

KEY QUOTES

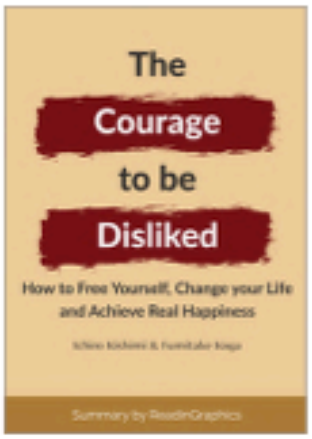
"Creating social accountability can dramatically change our behavior."

Conclusion and Other Details in the Book

The tools in this book can help you to overcome obstacles to change and to form helpful habits. However, the only way to achieve permanent, transformative change is to continually apply the techniques. Evaluate your obstacles as your goals and circumstances change, and adjust your game plan accordingly.

In this summary, we've captured the key insights on how to change. The book includes many other examples and references to help you understand and apply the concepts. For more details, please visit www.katymilkman.com.

"Transformative behavior change is more like treating a chronic disease than curing a rash."



THE COURAGE TO BE DISLIKED

How to Free Yourself, Change your Life and Achieve Real Happiness

Ichiro Kishimi & Fumitake Koga

The Big "So What"

The book answers the question "How can you achieve real happiness?" using insights from Adlerian psychology. The authors discuss concepts about self-acceptance, interpersonal relationships, personal growth, and personal freedom. They encourage readers to chart their own paths to find true happiness and fulfilment, even if it means breaking social norms and expectations.

Introduction

This book presents the key ideas and teachings of Austrian psychologist Alfred Adler, who founded "individual psychology." Contrary to common belief, Adler's philosophies differ from those of famous psychologists Sigmund Freud and Carl Jung. Adlerian psychology is more aligned with Greek philosophy and the teachings of Socrates, Plato, and Aristotle. Adler believed that happiness isn't something that happens to you, but the result of how you choose to live your life. You'll naturally find happiness if you develop yourself, build healthy interpersonal relationships, and contribute to your community.

There are 2 key behavioral objectives in Adlerian psychology:

- To *be self-reliant as an individual*. This requires the mindset "I have the ability (to create and steer my life)."
- To *live in harmony with society*. This requires the mindset "People are my comrades."

KEY QUOTES

"Your life is not something that someone gives you, but something you choose yourself, and you are the one who decides how you live."

The authors dive into these ideas using a dialogue between a wise philosopher and a young man who's unhappy with life.

- Over 5 nights of intense debate, the young man learns many concepts around these *5 overlapping themes*:

  (i) Your past doesn't dictate your future.

  (ii) To gain personal freedom, you must take responsibility for your life tasks, and let go of the need for external validation.

  (iii) All problems come from interpersonal relationships. So, you must improve your relationships to improve your life.

  (iv) The goal of relationships is to gain a sense of belonging, and you can only achieve this by contributing actively to your community.

  (v) Live earnestly in the present moment to enjoy a fulfilling life.

- In this summary, we've distilled and organized these inter-related ideas into *3 main parts*, presented in the next section.

Achieving Happiness & Fulfilment in Life

Your Past Does Not Dictate Your Future

According to Adler, there's no such thing as trauma. Painful experiences in the past cannot dictate your attitudes/actions unless you allow them to do so.

- The world is simple. It only seems complex because of our *subjective perspectives*. The same thing/event can be perceived differently by different people. For example, a glass of water at 15°C tastes cool to someone in the hot sun, but it tastes warm to someone in a freezing room.

"The world is simple and life is simple, too."

KEY QUOTES

- We're not defined by our experiences, but by the meaning we give to those experiences. What happened in the past matters less than *how we interpret and respond* to those events.

That's the difference between etiology vs teleology.

- *Etiology* focuses how the past affects the present. This is the approach adopted by Sigmund Freud, who focuses on how past experiences, traumas, or psychic wounds impact our current thinking and behaviors.

- By contrast, *teleology* in Adlerian psychology ignores the past. It focuses on how our actions are driven by our current goals and motivations for the future.

    - Imagine a young man, Tom, who dares not step out of his room. The moment he does so, he starts to suffer from severe palpitations. From an etiological viewpoint, Tom probably suffered from some trauma in the past which led to his fear of going out. From a teleological viewpoint, Tom's past doesn't matter. He's not going out because he doesn't *want* to go out (possibly because he wants his parents' concern and attention). So, he works himself into a state of fear/anxiety to keep himself indoors.

Everyone experiences emotions, but we're not controlled by our emotions. Instead, we create and direct our emotions as part of our response to external situations.

- No one can "make" you angry. If you're angry, it's because you *choose to use anger as a tool* to achieve your goals.

    (i) If a waiter spills soup on your favorite shirt and you start yelling at him, it's not because you've lost control of your anger. You've actually created the anger so you can yell at the waiter and get him to submit to you.

    (ii) If you receive a call from your boss in the midst of a heated argument with your son, you'll probably switch to a calm tone to address your boss. Then, once you put the phone down, you start shouting at your son again. This shows that anger can be put away like a tool. You're just using it to manipulate the person/situation.

- Instead of blaming events/people for "making" you angry, take *emotional responsibility* by acknowledging that you choose to be angry.

KEY QUOTES

"We are not determined by our experiences, but the meaning we give them is self-determining."
—Alfred Adler

"You are unable to change only because you are making the decision not to."

Regardless of what happened in the past, everyone has the ability to change and shape their future.

- It's true that you cannot change what happened in the past. For example, if you were abused as a child, that's a fact. But, you can *choose not to let those memories define and control you*.

- Even your personality is not fixed, and you can change your dispositions. Adler uses the term "lifestyle" to describe how we tend to think and act. He argues that the way we see ourselves and the world are 2 sides of the same coin. For example, you can say "I'm an optimist" (personality) or "I have an optimistic view of the world" (viewpoint). The former sounds unchangeable, whereas the latter sounds malleable. By *changing the lenses* through which you view the world, you can start to see yourself and the world differently.

However, it takes courage to change and grow. Change is scary because it involves uncertainty. So, most people would rather complain about their circumstances and justify why they're helpless to change the status quo. They tell themselves, "I can only succeed if I'm like X" or "I'll be happy only if Y happens". These are merely their excuses for not changing.

Many people spend their lives being trapped by regrets about the past or anxieties about the future. A key to happiness is to focus fully on the here and now.

- You cannot change the past nor control the future. You can only accept the past, look forward to the future, and focus your energy on *making the most of the present moment*. Your choices and actions today will shape your future. So, use whatever you have right now to achieve your goals/desires.

- We tend to think of our lives like a storyline, from the time we're born until the time we die. We fabricate stories to string together the events in our lives. However, it's more accurate to think of *life as a series of dots*, each representing a moment. Your life is the sum of those moments. So long as you live each moment fully and earnestly, you'll have a rich and fulfilling life.

- If you're overly-focused on *reaching a destination* (e.g. earning $1 million, becoming a famous actor), you'll treat everything

KEY QUOTES

"The important thing is not what one is born with but what use one makes of that equipment."
—Alfred Adler

"We do not lack ability. We just lack courage. It all comes down to courage."

"We cannot alter objective facts. But subjective interpretations can be altered as much as one likes. And we are inhabitants of a subjective world."

you do as a means to an end, to be completed as quickly as possible. If you fail to achieve the end-goal, your whole life seems like a failure. Even if you reach your goal, you may not be happy.

- Instead, *live each moment like you're dancing*. Realize that even if you die tomorrow, your life is complete as it is. Enjoy each moment fully, rather than see it as a step toward something else.

Gain Freedom through Personal Responsibility

Adlerian individual psychology is built on the concept of "holism," which says that each individual is a single, unified whole. You can't split your mind from your body, your conscious mind from your unconscious mind, nor your thoughts from your emotions. When you lose your temper and yell at someone, you're doing it as a whole person. Your emotions cannot "force" you to do it.

To be a member of society, you must perform 3 types of "life tasks". Fulfilling these tasks give you a sense of belonging and self-worth.

- *Work tasks* are the things you do as a part of your job, career, or contribution to society. Every person has the capacity to make a positive contribution.

- *Social tasks* relate to your relationships with other people outside of work, such as friendships or romantic relationships.

- *Love tasks* involve deep, intimate ties, such as those in love relationships or parent-child relationships. The closer the ties, the harder it is to build and maintain the relationship.

To enjoy personal freedom and happiness, you must take full responsibility for your life tasks, and leave others to theirs. Adler calls this the separation of tasks.

- *Know where your task ends and where others' task begins*.

  (i) Ask: Whose task is this? Who will ultimately benefit from the task or decision?

KEY QUOTES

"If one is living each moment earnestly, there is no need to get too serious."

"We are not struck by emotions that somehow exist independently from us. Each of us is a unified whole."

(ii) You can only be responsible for your own thoughts, feelings, and behaviors. You cannot control others' thoughts, feelings, and actions, including whether they like or dislike you.

- *Adopt the non-interference principle*: don't interfere with other people's tasks, nor let others interfere with yours. This is not about being indifferent or aloof. It's about untangling the knots in a relationship to see things more clearly. Live according to your own values and principles, respect others' autonomy, and recognize the limits of your responsibility and influence. For example:

  (i) If your parents oppose to your career choice, it's not your task to change jobs just to make them happy. Your task is to choose the path that you believe is right for you.

  (ii) If you have an unreasonable boss who yells at you all day, it's not your task to make him like you, nor to satisfy his every whim. You task is to do your job as best as you can, regardless of your boss's behavior.

  (iii) Studying is a child's task since it affects his learning and future. If your child refuses to study, don't intervene by punishing him or forcing him to study. Instead, let your child know that it's his task to study, stay interested in what he's doing, and be ready to assist whenever he needs it.

Task separation requires that you (i) stop living according to others' expectations, and (ii) stop demanding that others satisfy your expectations. This is hard to achieve because you must let go of the need for external validation.

- It feels good to be liked and recognized by others, and everyone likes to feel accepted and valued. But, if you're driven by the need for others' approval or recognition, you'll end up *living someone else's life* instead of your own. You may be tempted to do the wrong things just because no one is watching, or fail to do the right things because no one will notice.

- To achieve task separation, you need the *courage to be disliked* by others. You must also be honest with yourself: stop finding excuses to avoid your life tasks, blaming external factors or people for your unhappiness, lamenting about past injustices, or wishing for others to change.

KEY QUOTES

"What I should do is face my own tasks in my own life without lying."

"If you are not living your life for yourself, then who is going to live it for you?"

"All you can do with regard to your own life is to choose the best path that you believe in."

"Intervening in other people's tasks and taking on other people's tasks turns one's life into something heavy and full of hardship."

"People who are obsessed with...a desire for recognition will seem to be looking at other people, while they are actually looking only at themselves."

"Instead of waiting for others to change or waiting for the situation to change, you take the first step forward yourself."

Once you embrace task separation and release the need for recognition, you'll realize that you hold all the cards. Focus on the things you can do/change, rather than fret over things beyond your control. This will ultimately set you free and allow you to find true happiness.

Find Happiness by Contributing Actively to your Community

Human beings are social creatures. We get the greatest satisfaction and happiness when we feel like we belong and are making a positive contribution. Our well-being is closely tied to our relationships with others. In fact, Adler says that all problems are rooted in interpersonal relationships, since relationship problems will always spillover to other parts of our lives. When we improve our relationships, we naturally improve our lives.

Relationship problems are linked to our feelings of inferiority or a lack of self-worth.

- Feelings of inferiority aren't always negative. They can be a source of motivation to learn, improve, and strive for new heights, thus fueling healthy personal growth and improvement. Alder calls this the "*pursuit of superiority*."
- However, they can also lead to a defeatist attitude and a loss of courage if you develop an *inferiority complex*. This is when you tell yourself "I'm not good enough no matter what" or "Nothing I do will make a difference." Rather than overcome your shortcomings (e.g. a lack of skills or education), you use them as an excuse not to take action.
- Feelings of inferiority may also lead to a *superiority complex*, when people act as if they're better than others, and brag about their successes, their achievements, or even their misfortunes. They're actually trying to make themselves look/feel special to hide their insecurities. People who're truly confident about themselves won't feel the need to show off.
- Have the *courage to be "normal"*. You don't need to be extraordinary to lead a fulfilling life. Rather than struggle endlessly to outdo others or prove your superiority, use what you already have to grow, contribute, and add value to others.

KEY QUOTES

"The courage to be happy also includes the courage to be disliked."

"All problems are interpersonal relationship problems."

"The pursuit of superiority and the feeling of inferiority are not diseases but stimulants to normal, healthy striving and growth."

"If one really has confidence in oneself, one doesn't feel the need to boast."

"Being normal is not being incapable. One does not need to flaunt one's superiority."

See others as comrades, not enemies/competitors. Many people are unhappy because they see the world through competitive lenses, and treat other people as rivals or enemies.

- In *competitions*, there are always winners and losers. It's hard to celebrate others' successes if you see them as signs of your own "defeat".

- Life is not a zero-sum game where your success must come at the expense of someone else's. When you *see others as comrades*, you can celebrate mutual progress/success, and enjoy the sense of camaraderie and connection. The more you contribute to others, the more value you see in yourself. This sense of purpose and self-worth is what brings you true happiness.

- You can improve yourself without putting others down or asserting your superiority. Instead of comparing or competing against others, compare and *compete against your ideal self*.

- Don't allow yourself to get drawn into a *power struggle*. Imagine you're having a heated political debate with a friend, when he starts to call you "stupid" and "ignorant". When this happens, he's no longer trying to discuss politics, but to get you to submit. If you respond to his taunts, you'll only get drawn into a lose-lose situation.

  - If he "wins" the argument, you'll feel defeated. If he "loses" the argument, he'll feel slighted and seek revenge in the future. Either way, *your relationship is damaged*.

  - When you're facing a potential power struggle, *do not engage*. Choose to communicate through words and logic, not through anger.

- It is also not a weakness to *admit to a fault or a mistake*. Even if you think you're right, don't criticize the other person or say that he's wrong. This only shifts the focus to who's right or wrong to start a power struggle.

The goal of interpersonal relationships is to get a sense of community or belonging. This comes from being of use to others.

- In Adlerian psychology, this sense of community doesn't come from physical presence alone, e.g. being born into a

KEY QUOTES

"Life is not a competition."

"Happiness is the feeling of contribution."

"It's enough to just keep moving in a forward direction, without competing with anyone."

"It's only when we take away the lenses of competition and winning and losing that we can begin to correct and change ourselves."

"A sense of belonging is something that one acquires through one's own efforts—it is not something one is endowed with at birth."

family. You must *actively contribute* to the community by fulfilling your life tasks. Instead of focusing on what others can do for you, focus on what you can do for others.

- The Adlerian definition of "community" is extremely broad. It includes your family, friends, social/professional groups, society at large, humankind, and *everything in the universe*—from the past to the future, from living things to inanimate objects. All of us have multiple communities.

  (i) Even if you're not married and have no job/friends, you're still a part of humanity and have an impact on others. For example, when you buy a meal, the money gets circulated into the economy to affect other people. You also consume resources that impacts the wider community and eco-system.

  (ii) Anyone can have existential value, e.g. a newborn brings joy to her parents just by existing, even if she's not actively "doing" something to contribute.

To get the sense of community, you must **shift from self interest to social interest**, which requires 3 things:

- *Self-acceptance*: Accept yourself as you are, complete with your flaws and imperfections. Only then can you identify what you can do and how you can improve.

  (i) For example, if you're only performing at 50%, acknowledge that fact and ask "How can I get closer to 100%?" What can you do with the skills, strengths, and resources at your disposal?

  (ii) This is better than pretending that you're already at 100%, blaming your poor performance on bad luck, or wishing for things you cannot change.

- *Confidence in others*: Believe in other people's inherent potential and goodwill. Instead of waiting for people to "earn" your trust, show unconditional confidence in their good intent or potential.

  (i) This helps to build deep relationships and encourage people to rise to their potential. For example, if someone deceives you, yet you're willing to believe him unconditionally, he will probably find it hard to deceive you again.

KEY QUOTES

"When it comes down to it, all of us belong to the community of the earth, and the community of the universe."

(ii) However, this doesn't mean that you should naively trust everyone. It only applies to people with whom you wish to build a better or deeper relationship with. If someone repeatedly deceives you, then it's your task to decide whether to cut the ties.

(iii) By contrast, relationships built on doubt and suspicion can never be strong or healthy. No matter what they say/do, you can always interpret it negatively to confirm your suspicions.

- *Contribution to others*: Once you accept yourself and have unconditional confidence in others, you'll naturally see people as comrades and want to contribute to their welfare. In the process, you feel happy because of the innate sense of existential worth, which further reinforces your self-acceptance in a virtuous cycle. You feel assured of your value even if your contributions aren't explicitly seen or recognized by others.

(i) Contribution to others is simply about being of use to others. It does *not* require self-sacrifice, which could be a sign that you're conforming too much to social expectations.

(ii) One of the most common ways to contribute is through work or labor. This can include anything from raising your children to performing acts of kindness for strangers.

To improve your happiness and well-being, build "horizontal relationships" based on equality and respect.

- This is about seeing others as *different but equal*.

(i) Respect individual differences (e.g. gender, race, religion, values, life experiences) without seeing them as superior or inferior to you.

(ii) Recognize different types of contribution, e.g. a working husband contributes income to the family, whereas a stay-home mum cares for the home and kids. Neither is superior to the other.

- This is different from hierarchical or *vertical relationships*, where one party is seen as inherently superior to the other.

KEY QUOTES

"It is through labor that one makes contributions to others and commits to one's community."

"Human beings are all equal, but not the same."

(i) When you criticize or praise someone, it suggests that you're in a superior position to judge whether he/she is doing something right/well.

(ii) When you interfere with someone's task, you're acting from a vertical relationship to assume you know what's good for the other person.

- It is much better to *offer encouragement*, i.e. to give people the courage to take on their life tasks. To do so, you can:

  (i) Offer assistance without direct interference; and/or

  (ii) Convey your gratitude. For example, when you say "Thank you, this was a great help to me" it tells the other person that they've made a valuable contribution without judging how "good" they are.

- In cases where a hierarchy is necessary (e.g. in organizational structures), you can still maintain equality in consciousness. For example, if you know that your boss's instructions are detrimental to a project, you can respectfully assert yourself instead of following orders blindly.

In short, happiness isn't a goal in itself, but a by-product of a life well-lived—a life built on self-actualization and healthy relationships. According to Adler, life has no inherent meaning, and it's up to you to give meaning to life. You can choose to the see world as a terrible place full of enemies, or you can choose to see it as a wondrous place full of comrades.

- It's ok if you don't know what to do yet. So long as you *contribute to others and live each moment to the fullest*, you'll eventually find meaning and happiness in life. Keep asking yourself "What can I do now?" or "What can I do from now on?" Reject all excuses that lead you to avoid your life tasks.

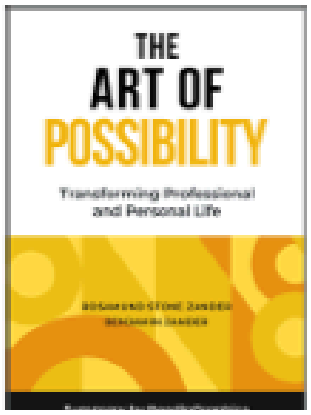
- Just *take the first step* regardless of what others do or don't do. As you change, the world will seem to change too. That's because (i) you will start to see things differently, and (ii) people will start to respond to you differently.

KEY QUOTES

"What is important is to be equal in consciousness, and to assert that which needs to be asserted."

"You can assign meaning to that life. And you are the only one who can assign meaning to your life."

"Do not look at the past, and do not look at the future. One lives each complete moment like a dance...As long as you are dancing, you will get somewhere."



THE ART OF POSSIBILITY

Transforming Professional and Personal Life

ROSAMUND STONE ZANDER & BENJAMIN ZANDER

The Big "So What"

When you're stuck with a seemingly-impossible problem, the best way to get unstuck is to shift your perspective. In this book, the authors combine their knowledge and experience as a conductor and a therapist, to present 12 practices that you can use to see new possibilities and bring them to life. By applying these principles and tools over time, you can transform your results and relationships.

However, to reconstruct how you perceive the world, you must first be willing to challenge your beliefs and assumptions, and to keep applying the practices until the new ways of thinking and behaving become intuitive to you.

KEY QUOTES

"The objective of this book is to provide the reader the means to lift off from that world of struggle and sail into a vast universe of possibility."

"It takes dedication, a leap of faith, and, yes, practicing to get them into your repertoire."

The 12 Possibility Practices

Practice #1: Realize that Everything is Invented

Everything we know is actually filtered through our mental stories. You pick up selective info about the environment via your 5 senses (e.g. your nose picks up a scent). Your brain interprets the info before you have a conscious experience ("I smell oranges!"). By the time you're conscious of something, your brain has already gone through a complex process of info-selection, cue-matching and story-telling.

Our perceptions are always flawed:

- All living creatures are hardwired to "see" the world in a way that helps them survive. A frog's eye "sees" differently from the human eye. It sees the world in terms of moving outlines and sudden changes in light (which helps it to react to insects and predators), but it cannot perceive the beauty of the sunset or appreciate a field of colorful flowers.

"All of life comes to us in narrative form; it's a story we tell."

"The world comes into our consciousness in the form of a map already drawn, a story already told, a hypothesis, a construction of our own making."

Likewise, *human senses are limited*—we don't see/sense *everything*, e.g. we can't see molecular traces like insects do, or pick up scents the way dogs do.

- We also use *mental maps* (theories and beliefs) to make sense of what's going on. We can't recognize things that aren't on our mental map, e.g. you won't recognize the smell of oranges if you've never seen/tasted one, and you won't realize you're affected by gravity if you haven't learned about it.

- Our brains also tend to connect events, people and ideas into *stories* even if there are no direct links (e.g. if we see someone eating a dish with gusto, we conclude that it tastes good).

The first practice is simply to recognize that **everything is invented**, including what we think is a truth or fact.

- *Even science isn't absolute*. Scientific truths evolve as new discoveries are made. Newton helped us to see the world in terms of straight lines and forces, while Einstein helped us to see the world in terms of curves, space/time and relativity. Like gravity, all these phenomena have always existed, yet we couldn't "see" them until we've made the paradigm shifts.

- So, instead of insisting that what you know is the absolute, unchanging truth, realize that it's all invented. A seemingly-insurmountable problem can usually be resolved if you approach it from another angle. Once you recognize the self-imposed *frames and boxes* you've put around yourself, you can start to reinvent them to improve your life.

- *Keep asking yourself these questions*:

  (i) What unconscious assumptions am I making that lead me to see/ believe what I do?

  (ii) What new assumptions can I adopt to give me new options?

KEY QUOTES

"The frames our minds create define—and confine—what we perceive to be possible."

"Each new paradigm gives us the opportunity to "see" phenomena that were before as invisible to us as the colors of the sunset to the frog."

"It's all invented anyway, so we might as well invent a story or a framework of meaning that enhances our quality of life and the life of those around us."

"Every problem, every dilemma, every dead end we find ourselves facing in life, only appears unsolvable inside a particular frame or point of view. Enlarge the box, or create another frame around the data, and problems vanish, while new opportunities appear."

Practice #2: Move from Scarcity to Abundance

We live in a "world of measurement" where everything is evaluated against goals, standards, and comparisons.

- Underlying all human struggles—our fears, doubts and disappointments—is the hidden assumption that we must fight to survive in a world of *scarcity and danger*.

- This leads us to constantly watch for danger, build our reserves, and maintain our defences. We constantly measure where we stand and evaluate things/people by *measuring, comparing and contrasting* them against one another.

What if you were to change this fundamental assumption and step into a world of possibility?

- The key is to differentiate between *scarcity vs scarcity-thinking*. Even if you truly face scarcity and threats to your survival (e.g. you're living in a poor, war-torn area), you're still free to create infinite possibilities using your creativity and resourcefulness. Unfortunately, the reverse is true in most cases—people who're well-do-to are plagued by scarcity-thinking. They *think* the world is out to get them, so they hog resources and keep grabbing more and more to create real scarcity in the process.

- Scarcity-thinking assumes that the pie gets smaller each time you take something. On the other hand, *abundance-thinking* assumes the pie is unlimited and you can add to the pie each time you receive from it. For example, businesses don't have to compete for a finite pool of customers; they can generate infinite new ideas to create new customers. With an abundance-mindset, you're likely to give more, create and add value, thus generate *real* growth and abundance.

Learn to let go of the need to measure and judge everything:

- Ask yourself: How do my current thoughts and actions reflect the world of measurement? Look for signs of competition, comparison, anxiety, or fear of survival/ scarcity.

KEY QUOTES

"It feels safer to deal with reality as though it were fixed, as though people, ideas, and situations can be fully known and measured."

"Free from the generalized assumption of scarcity, a person stands in the great space of possibility in a posture of openness, with an unfettered imagination for what can be."

Practice #2: Move from Scarcity to Abundance

We live in a "world of measurement" where everything is evaluated against goals, standards, and comparisons.

- Underlying all human struggles—our fears, doubts and disappointments—is the hidden assumption that we must fight to survive in a world of *scarcity and danger*.

- This leads us to constantly watch for danger, build our reserves, and maintain our defences. We constantly measure where we stand and evaluate things/people by *measuring, comparing and contrasting* them against one another.

What if you were to change this fundamental assumption and step into a world of possibility?

- The key is to differentiate between *scarcity vs scarcity-thinking*. Even if you truly face scarcity and threats to your survival (e.g. you're living in a poor, war-torn area), you're still free to create infinite possibilities using your creativity and resourcefulness. Unfortunately, the reverse is true in most cases—people who're well-do-to are plagued by scarcity-thinking. They *think* the world is out to get them, so they hog resources and keep grabbing more and more to create real scarcity in the process.

- Scarcity-thinking assumes that the pie gets smaller each time you take something. On the other hand, *abundance-thinking* assumes the pie is unlimited and you can add to the pie each time you receive from it. For example, businesses don't have to compete for a finite pool of customers; they can generate infinite new ideas to create new customers. With an abundance-mindset, you're likely to give more, create and add value, thus generate *real* growth and abundance.

Learn to let go of the need to measure and judge everything:

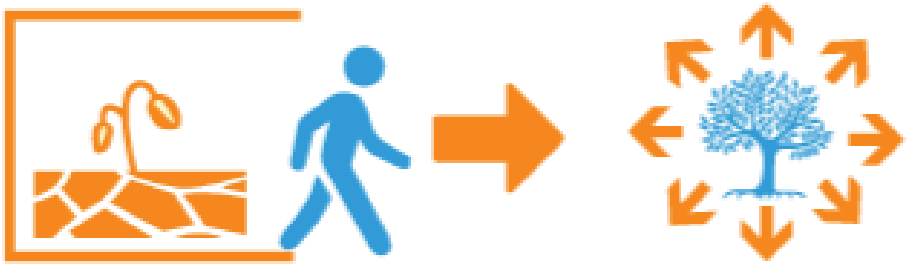
- Ask yourself: How do my current thoughts and actions reflect the world of measurement? Look for signs of competition, comparison, anxiety, or fear of survival/scarcity.

KEY QUOTES

"It feels safer to deal with reality as though it were fixed, as though people, ideas, and situations can be fully known and measured."

"Free from the generalized assumption of scarcity, a person stands in the great space of possibility in a posture of openness, with an unfettered imagination for what can be."

- Reframe your thoughts and ask the same question over and over, until you realize how ridiculous it is to keep measuring and judging everything. Make a decision to let go and step into a new world of possibilities.



Practice #3: Gift an A

We tend to grade people (literally or mentally) and use that grade to define their abilities/potential. In reality, grades often don't mean much; a C-grader in a top school could actually be doing much better than an A-grader in another school. Just like how a carver recognizes the potential of an uncut stone, the role of any leader—be it a teacher, manager or parent—is to bring out the potential of the person in front of you.

- In Ben's class on musical performance, he told every student from the onset that he'd give them an "A" for the course. The only condition was, they had to write a letter (dated 1 year later) to describe in detail what they'd done over the year to get the grade. As the students described their milestones, achievements and feelings, they got a *vision* of the A students they could be, while Ben felt motivated to groom a class of A students.

- When the students made a *mistake*, Ben encouraged them to exclaim, "How fascinating!", then take a closer look to see what could be learned from the experience.

Obviously, grades and actual performance are important. The crux of this practice is to realize that all standards (be it grades or ranking) are man-made. We can choose to use standards to create possibilities instead of label/judge people.

- Treat standards as a *common goal* to work toward (between a student and teacher, or a manager and staff), rather than an assessment of someone's ability.

- The fastest way to "change" someone is to *change your own perception*. Every human being has an innate desire to

KEY QUOTES

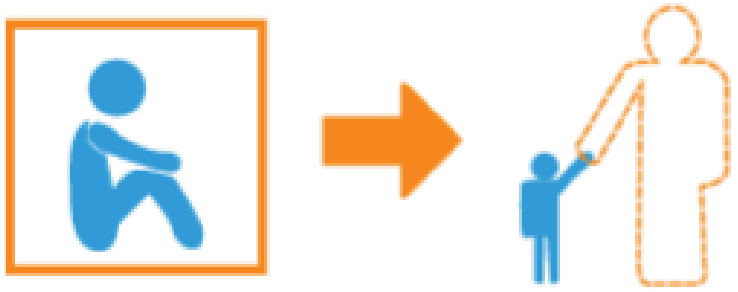
"In the measurement world, you set a goal and strive for it. In the universe of possibility, you set the context and let life unfold."

"This A is not an expectation to live up to, but a possibility to live into."

contribute and make a difference. When people believe they're A Graders are more likely work hard and persevere to deliver results. When you give someone an "A", you're more likely to notice their positive qualities and accept their inputs, thus creating a partnership that delivers real results.

- Likewise, when you *give yourself an "A"*, you're accepting yourself as you are, and not because you've achieved certain outcomes or standards.

- In short, when you *give an "A" to people as a gift* (not as a gauge of what they've done or who they are), you open up a new world of possibilities for yourself and others.



Practice #4: Be a Contribution

Most of us are constantly judging everything we do. We try to achieve "success" and avoid "failure", only to feel **stressed and dissatisfied** as no amount of achievement seems to be enough. Why should a positive contribution be labelled as a success or failure based on an invented target or standard?

Try thinking of your life as a **series of games** instead. You're free to choose which games to play, and you're free to move on to a new game any time.

To transform your struggles into fulfilling experiences, **redefine yourself as a contribution**, i.e. someone who makes a difference.

- Ask yourself: "*How can I be a contribution today?*". Just focus on making a difference, without worrying about how much you've achieved or whether you're good enough.

- Try writing down everything you've done in the past week that contributed to someone (e.g. helping a blind man to cross the road, running an errand for your parents). Imagine how each contribution may have created further ripple effects.

KEY QUOTES

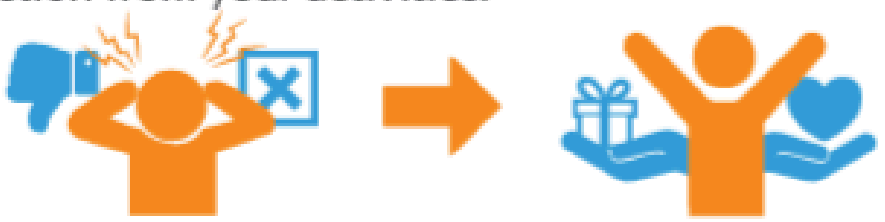
"The practice of giving the A allows the teacher to line up with her students in their efforts to produce the outcome, rather than lining up with the standards against these students."

"The freely granted A expresses a vision of partnership, teamwork, and relationship."

"The drive to be successful and the fear of failure are, like the head and tail of a coin, inseparably linked."

"In the game of contribution you wake up each day and bask in the notion that you are a gift to others."

In the next week, take note of every contribution you make without judging how much or little it is. By *shifting your focus* away from your own problems to the positive contribution you're making, you reduce your anxiety and increase the satisfaction from your activities.



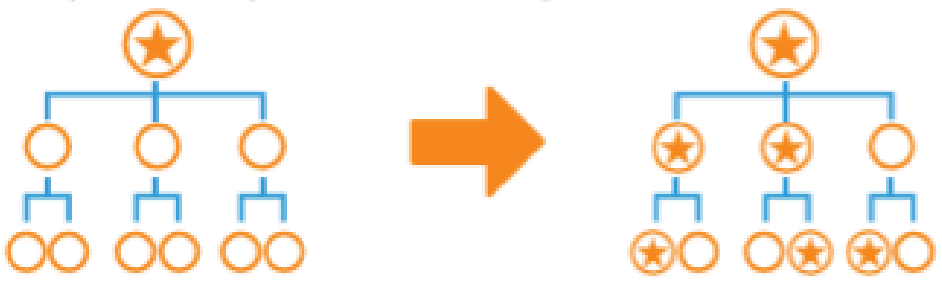
Practice #5: Lead from Any Position

In most orchestras, the conductor dictates how the music should be interpreted, and the players have little/no room to influence the direction of the music.

- Ben believes that a great conductor should coax the best possible music from his orchestra, even if the music is interpreted differently from conductor's original idea. To empower every musician to play as beautifully as possible, he asked them to write down how he could enable them to play better. As the players suggest alternative ways to conduct and interpret the music, the orchestra's music was elevated to a new level.

- In 1999, the Youth Philharmonic Orchestra from USA and the National Youth Orchestra of Cuba did a combined performance. Each conductor was struggling to coach the other orchestra on their chosen music piece. They finally overcame the challenge by having each player guide his/her counterpart instead of using a top-down approach.

In a large group, there'll always be people who can offer talents and insights if they're given the chance to do so. This practice is about *finding and unlocking the hidden passion and commitment* that exists in every person. When you see a listless, dispirited team member, you can assume the person is unmotivated, or you can take it upon yourself to find out what it'll take to bring out the spark and passion in that person.



KEY QUOTES

"In the music business, as in all walks of life, a leader who feels he is superior is likely to suppress the voices of the very people on whom he must rely to deliver his vision alive and kicking."

"A conductor's true power derives from his ability to make other people powerful."

"A monumental question for leaders in any organization to consider is: How much greatness are we willing to grant people?"

"A leader does not need a podium; she can be sitting quietly on the edge of any chair, listening passionately and with commitment, fully prepared to take up the baton…the leader may be any one of us."

Practice #6: Lighten Up

All of us have a "calculating self" that's constantly on the lookout for perceived threats, trying to prove ourselves and ensure we don't lose out in a world of scarcity.

- When we feel threatened, we instinctively try to assert control or defend ourselves. We lash out and make demands, only to start a *downward spiral* that locks us in conflict, competition or impasse.

- Humor and laughter help us to *stop taking ourselves too seriously*. When we loosen up, others also relax and the negative spiral is broken. During a long, exhausting music practice, Ben instructed the players to stop making mistakes. Sensing the immediate tension in the room, he quickly added, "If you make a mistake...a five-hundred-pound cow will fall on your head." Everyone laughed, lightened up and played better after that.

- In the end, our own fears, views and positions are the real obstacles that stand in the way of a rewarding experience. Ask yourself: "*What would have to change for me to be completely fulfilled?*" When you let go of your self-imposed expectations and rules, the things that previously bothered you may suddenly disappear. For example, you may have become defensive because you felt judged by your spouse. Once you relax and focus on other aspects of the relationship, things may improve naturally.

When you lighten up, your calculative self weakens its hold to allow your "central self" to shine through. This is your authentic self that's creative, whole and abundant.

- Your central self recognizes how your own pride and indignation can get in the way of your desired outcomes. Once you realize the source of your fears and concerns, you can explore new ways to address them.

- Two business partners were stuck in a stalemate over their contract. They had complementary strengths needed for the business, but were too entrenched in their own positions to

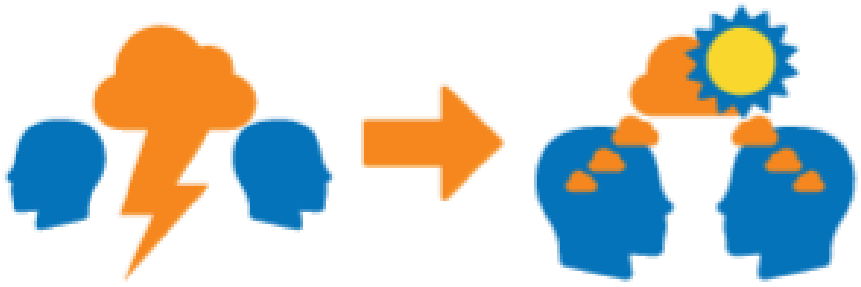
KEY QUOTES

"When...we coax this calculating self to lighten up...we break its hold on us."

"Human beings are social animals; we move in a dance with each other, we are all fundamentally immeasurable, we all belong."

"When one person peels away layers of opinion, entitlement, pride, and inflated self-description, others instantly feel the connection."

consider alternatives. Roz managed to draw out a few common truths, e.g. one of the partners had failed to deliver on his promise while the other had been overly rigid with the contractual terms. Once their central selves could see how their calculative selves were getting in the way of a mutually-beneficial contract, it opened up the way for a proper dialogue to address each other's concerns.



Practice #7: See the Way Things Are

Have you ever felt resigned that there's nothing you can do because "that's just the way things are"?

- This practice is about becoming present to (i) what's truly happening and (ii) your own reactions to them, so you *get clear on your circumstances* and what you can do to move toward your desired outcomes.

- Imagine you arrive at the airport full of anticipation for your long-awaited ski vacation, only to find that the flight has been delayed indefinitely due to a snowstorm. You can rant and rave about how unfair it is (which will change nothing). Or, you can acknowledge your disappointment with the delay and uncertainty, then *shift your attention* to what you can do, e.g. use the time to rest, enjoy a nice meal, or research alternative travel options.

Don't resist what is. Instead, gather the facts of the situation so you can decide what to do with it. This requires that you learn to discern between facts, feelings and assumptions.

- *Listen for "shoulds"*. When you feel frustrated because things are not how they *should* be, it's a clear sign of resistance.

- *Resist blame/denial*. When you're experiencing something unpleasant, don't deny your feelings, run away from the problem, or blame others. If you do so, you'll just be stuck with the very things you don't want.

KEY QUOTES

"The capacity to be present to everything that is happening, without resistance, creates possibility."

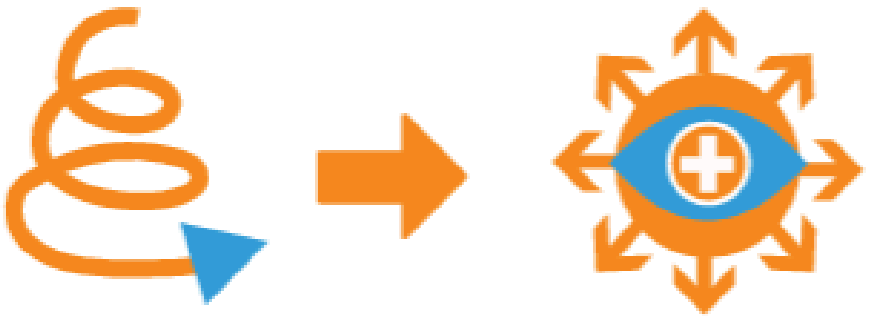
"The more attention you shine on a particular subject, the more evidence of it will grow."

- Realize that *nothing is purely good or bad*, e.g. the flight delay may shorten your trip but lead you to your future spouse.

Shift from downward spirals to possibility talk.

- Avoid *downward spiral talk*, i.e. speaking as if things are doomed to get worse. What we focus on grows—the more you focus on scarcity and problems, the more you'll notice them. When you make statements like "the barrier between my husband and I is getting worse", your brain will pick out evidence that supports the statement, and things will indeed seem to get worse. Instead, stop and refocus on the facts of what happened or what is happening, e.g. "We used to tell each other about our day. Nowadays I don't ask about his day and he doesn't volunteer information." Or "I feel irritated when my husband doesn't look at me when I talk to him."

- Once you can see things as they are, including your own biases, fears and imagined reality, you can *expand your viewpoint* and explore possibilities built on facts and reality. Martin Lurther King Jr's "I have a dream" speech is an example of how you can *speak in possibility* grounded in real-world truths.



Practice #8: Flow with Passion

We tend to see the objects/people around us as separate entitles, which creates **artificial barriers**. In reality, energy flows all around us and through us; it moves freely and isn't limited to rigid forms or lines.

This practice is about **giving in fully** to the creative energy waiting to be expressed through you.

- If a musician or presenter is obsessed with the way he stands, how he looks and whether each word/note is technically perfect, he'll deliver a stiff performance. On the other hand,

KEY QUOTES

"Abstractions that we unwittingly treat as physical reality tend to block us from seeing the way things are, and therefore reduce our power to accomplish what we say we want."

"Speaking in possibility springs from the appreciation that what we say creates a reality; how we define things sets a framework for life to unfold."

"Life takes on shape and meaning when a person is able to transcend the barriers of personal survival and become a unique conduit for its vital energy."

someone who's prepared to lose himself in the passion of the moment is much more likely to capture the audience's imagination.

- Become aware of the imaginary boundaries that hold you back (e.g. your public image, fear of disapproval). Allow those lines to be blurred and flow with your inner passions and vitality.

Practice #9: Ignite the Spark

It's untrue that you can only persuade others through manipulation or some form of exchange. In a world of possibility, persuasion can be as simple as giving people an "A" and being prepared to ask, give and receive freely. This practice is about enrolling people by igniting their imagination and bringing out their passion.

- Start by believing that others are ready to be enrolled by you, while being open to be inspired by them. Then, make your requests/offers with the conviction that they'll catch the spark.

- Roz needed 2 quarters to fill her flat tyre, but she only had a $10 bill and no one nearby had enough change for $10. In a flash of inspiration, she asked if one of them could *give* her 2 quarters instead. She got the 2 quarters she needed and the stranger who gave it to her felt good about making a difference.

- Ben was trying to get a sponsorship from Arthur Anderson for the Philharmonia Orchestra of London. Arthur Anderson, on the other hand, wanted to make a positive impact with Eastlea School (a "failing" school in a bleak part of London). Both sides were infected by each other's passion and came up with the idea of introducing the Eastlea students to classical music. Despite scepticism that the Eastenders wouldn't appreciate such music, the program turned out to

KEY QUOTES

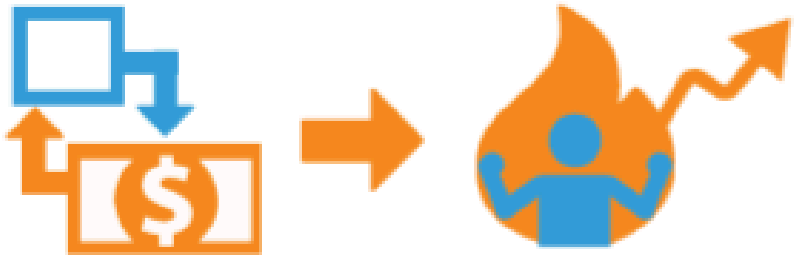
"Release those barriers of self that keep you separate and in control, and let the vital energy of passion surge through you, connecting you to all beyond."

"Enrolling is not about forcing, cajoling, tricking, bargaining, pressuring, or guilt-tripping someone into doing something your way. Enrollment is the art and practice of generating a spark of possibility for others to share."

"The life force for humankind is, perhaps, nothing more or less than the passionate energy to connect, express, and communicate."

be a huge success—the students were inspired and uplifted by the music, and the public saw an attentive, insightful side of the students they hadn't expected.

Passion is a great cure for fear and doubt. Appeal to passion and abundance (not fear and scarcity) as a source of motivation.



Practice #10: Be the Chessboard

When people act differently from our expectations or break certain "rules", we're quick to blame them for disrupting our sense of order and control, without considering our own roles in the situation. This practice is about shifting an external problem into yourself to see things from a fresh perspective.

- In chess, we typically think of how to move the pieces according to our strategy. When you think of yourself as the chessboard, you'll simply accommodate all possible moves instead of trying to control them. This gives you *freedom*, not because you can control the conditions, but because you can *choose* how you experience those conditions and respond to them.

- Let's imagine you're crossing the road when you're injured by a car that didn't stop in time. Legally, the driver is at fault since you started crossing after the lights turned green. However, instead of blaming the driver or fate, you can acknowledge your own role in the event. Just by being on the road, you created the context for the accident. You may also have been looking at your phone or assumed it was safe to cross without checking for oncoming vehicles. This does not mean that you're to blame or that you shouldn't seek recompense from the driver. Being the board simply helps you to see things more objectively so you can take enlightened actions.

KEY QUOTES

"Passion, rather than fear, is the igniting force."

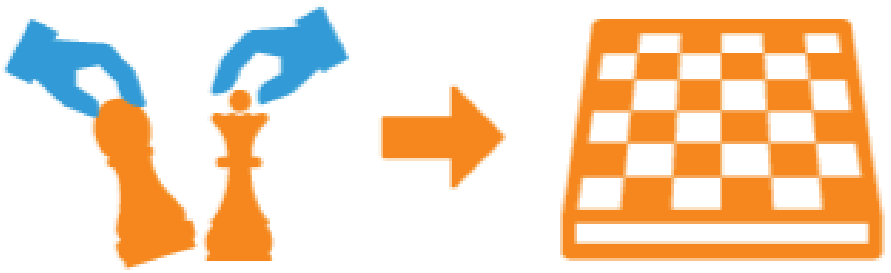
"When you are being the board, you present no obstacles to others. You name yourself as the instrument to make all your relationships into effective partnerships."

"Grace comes from owning the risks we take in a world by and large immune to our control."

Fundamentally, this practice is not about exerting control; it's about making a positive difference.

- When you shift your attention away from blame and what things *should* be, you free yourself to explore new possibilities. Define yourself as the board, examine how a situation landed on your board, and focus on how to make a difference.

- For example, you may be upset that you can't get your boss to listen to your suggestions. Instead of blaming him (for being arrogant or a poor listener) or blaming yourself (for being useless and unpersuasive), step back to consider how you may have contributed to his unwillingness to listen. Then evaluate what you can do to move things forward.



Practice #11: Create Possibility Frameworks

Leaders play a critical role in shifting people's focus away from scarcity/downward spirals, and toward possibilities/abundance instead. This practice is about generating options by restructuring meaning, developing visions and creating environments that support possibilities.

Define an alternative that can stop an existing downward spiral, then embody the vision to give new meaning to an existing action/event.

- When someone does something "wrong", our instinctive response is to punish the person, which only starts a downward spiral. A better approach is to ask: "How else can I approach the situation to *inspire desired behaviors through possibility?*"

- A leukaemia patient became the laughing stock of her class after she shaved her head due to chemotherapy. The teacher didn't defend the girl or reprimand her classmates.

KEY QUOTES

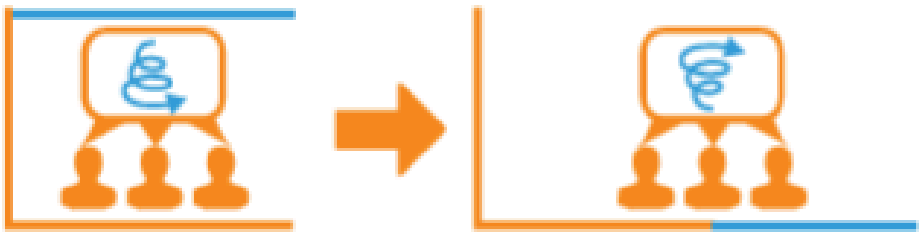
"Once you do transform your experience and see things differently, other changes occur."

She simply came to school one day sporting a shaved head. Soon, the kids in school were cutting their hair or shaving their heads as a fashion statement. By shaving her head, the teacher had *reframed* what it meant to look different and catalysed new behaviors.

When you articulate a strong vision, you're painting a common future that people can relate to.

- A great vision (e.g. "world peace", "bringing joy to everyday living"), is timeless and doesn't require benchmarks or a "right" way of doing things. It removes barriers and creates a new realm of possibility for everyone.

- You can still set goals when pursuing vision-led objectives. However, missing a goal won't kill your vision. Just declare "how fascinating!" and keep moving forward.



Practice #12: Focus on WE

An "us-vs-them" mentality promotes conflict because it assumes the differences (between religions, ideologies etc.) are irreconcilable. In such cases, "we" is defined as "You + I". The parties are seen as separate entities with different and unchanging desires, so if one party wins the other party must lose. Both sides end up fighting fiercely to protect their rights, positions and viewpoints.

The WE practice is about (i) identifying what connects people, (ii) listening/looking out for what emerges and (iii) jointly defining what WE want and the best thing to do for US. Start by defining every human as someone who desires to contribute and connect with others—this focuses your attention on what connects people rather than what separates them.

- Assume that WE are 1 entity, and there *can* be a direction where WE can move together to jointly define and achieve new goals.

KEY QUOTES

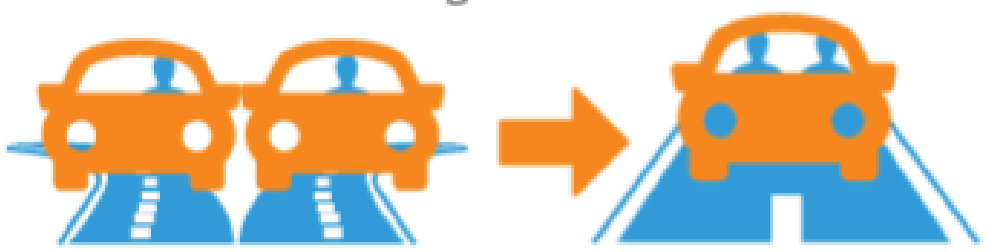
"A vision is a long line of possibility radiating outward. It invites infinite expression, development, and proliferation within its definitional framework."

"In the pursuit of objectives under a vision, playing is relevant to the manifestation of the possibility, winning is not."

- For example, instead of saying "If you don't give me a pay raise, I'll quit", you could take a WE approach: "We both seem to agree that I've been delivering good work. Unfortunately, the salary isn't enough to support my present commitments. What do WE want to see happen, and how can WE make it work?"

Separate your central selves from your calculating selves. Make your pride, greed, revenge, fear or sense of righteousness as the common enemy instead of each other. You can acknowledge, "OK, that was my Pride speaking" then focus on how to tackle the villain Pride together, instead of attacking each other.

- At the end of apartheid in South Africa, Mandela's government instituted the Truth and Reconciliation Commission (TRC). The TRC didn't dish out justice to people involved in the violence, but offered amnesty to those who'd share the truth. As the perpetrators shared their stories and the atrocities they committed, people saw their pain and how they broke down in tears. Instead of focusing on blame, revenge and justice, the TRC helped people to realize there wasn't a definitive line between "victim" and "perpetrator". It helped people to understand their past so they could heal and build a new future together.



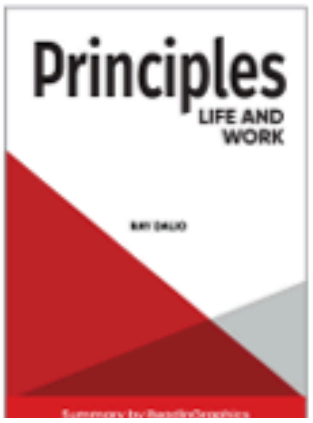
Other Details in the Book to Look out For

This is not intended as a guidebook with answers for specific real-world problems. Instead, the 12 practices in the book (along with the various stories, letters and reflections) equip you with alternative perspectives and approaches to face *any* challenge in life, and design the stage upon which you'd express yourself and discover life's unlimited possibilities.

KEY QUOTES

"The WE appears when, for the moment, we set aside the story of fear, competition, and struggle, and tell its story."

"The issues themselves are rarely what they seem, no matter what pains are taken to verify the scoreboard."



PRINCIPLES

Life and Work

RAY DALIO

The Big "So What"

Successful people are guided by principles, i.e. fundamental truths that guide their actions to help them achieve what they want in life. In this book, billionaire Ray Dalio shares the Principles that have helped him to succeed in work and life, in hope of helping you to uncover and apply *your* principles.

Introduction

After his early career success as an investment trader and broker, Dalio started his own brokerage firm, Bridgewater, in 1975. His achievements led him to become overconfident of his ability to predict the financial market. After suffering several major setbacks—including losing everything in the 1980s' market crash—he humbled himself, learned from his failures, and consistently documented and tested his decision-making criteria to gain powerful insights about work and life.

Dalio stopped running Bridgewater top-down as the sole expert and authority, and shifted to an idea meritocracy where the wisdom of every person in the organization can be harnessed. He sought to deepen/widen his perspectives, understand how humans think and behave, and how to leverage strengths toward specific goals. He also relentlessly refined his approach to investments (which will be elaborated in another book on investment principles).

The book is organized into 3 sections: (i) a detailed account of Dalio's personal journey and a breakdown of his (ii) Life Principles and (iii) Work Principles. In this summary, we'll present the Principles in 2 parts.

KEY QUOTES

"To be principled means to consistently operate with principles that can be clearly explained."

"The most important thing you can do is to gather the lessons these failures provide and gain humility and radical open-mindedness in order to increase your chances of success."

Part 1: Life Principles

The overarching principle in life is to think for yourself: decide (i) what you want, (ii) what's the truth, and (iii) how to achieve (i) based on (ii). Get clear on your principles and write them down so you can live with clarity and integrity.

1. Embrace Reality

Be a "Hyperrealist". Embrace *all* aspects of reality—both the good and bad. Dream big, but choose your goals wisely and take persistent action to realize them.

Learn from Nature. Mankind didn't invent the laws of nature; we merely learned them. Nature operates at a systemic level, balancing self-preservation with complex incentives and relationships so everything can coexist. To thrive, (i) align yourself with the group's goals, (ii) optimize for the whole (not yourself), and (iii) evolve through rapid trial and error.

- *Don't insist on how things "should" be*. Things that seem "bad" at a personal level always looks different from a higher perspective. Generally, something is "good" if it's aligned with reality and contributes to evolution as a whole. The more you support the larger good, the more you'll be rewarded.

- *Evolve or perish*. Everything evolves. Energy is transformed from one form to another, and all living things are merely DNA vessels in the evolutionary process. *Nothing* stays constant—you're either moving up or down the evolutionary curve.

- *Strength is built by pushing one's limits*. No pain, no gain.

To find new insights and solutions, see things from a higher plane.

- You're a machine within a larger machine. Think like the machine's *manager/designer*, not just a worker.

KEY QUOTES

"The principles you choose can be anything you want them to be as long as they are authentic—i.e., as long as they reflect your true character and values."

"There is nothing more important than understanding how reality works and how to deal with it."

"Don't worry about whether you like your situation or not. Life doesn't give a damn about what you like."

"Perfection doesn't exist; it is a goal that fuels a never-ending process of adaptation."

- *Don't deny your weaknesses*. Accept them and (i) convert them to strengths, (ii) work around them, or (iii) change your goals.

- Don't focus on first-order consequences or immediate outcomes (e.g. the pain and fatigue from exercise). Consider *second-order and third-order consequences* (e.g. better health /appearance) which are more significant.

Pain + Reflection = Progress. Reflect calmly during/after a painful experience to push through to a higher level. When you embrace who you are (including your weaknesses), you'll feel freer and happier.

2. Use this 5-Step Process to get what you want from life

Focus on 1 step at a time, then repeat the process in a loop. No one is equally good at all 5 steps—identify where you normally stumble, then find people/solutions to address your weaknesses. Be humble and build good mental maps to learn/improve.

Synthesize (steps 1-3) so you know what's happening and where you're headed.

Shape outcomes (steps 4-5) by designing and implementing solutions.

Set clear, audacious goals. You can't do/have everything. Choose your priorities (based on your values) and reject the rest. Don't confuse trappings of success (e.g. money, status) with what gives you true, long-term happiness. Set audacious goals that'll push you to achieve your potential.

Don't tolerate problems. Acknowledge them and treat them as opportunities for improvement. Be precise in identifying the problem, so you can apply the right solution. Focus on issues that'll create the biggest impact.

Diagnose the root causes. *Proximate* causes usually involve actions/inactions behind a problem, and are expressed as a verb (e.g. My conclusion was wrong because I didn't do properresearch). *Root causes*, if resolved, will remove the

KEY QUOTES

"If you can be open with your weaknesses it will make you freer and will help you deal with them better."

"Maturity is the ability to reject good alternatives in order to pursue even better ones."

"View painful problems as potential improvements that are screaming at you."

problem. They usually involve adjectives (e.g. I didn't do proper research because I was lazy). It requires that you to face up to unpleasant realities about yourself/others.

Design a plan before you act. *Review* what happened to bring you to where you are now, then look ahead to forecast what's required to reach your goals. *See the big picture* and interlinkages—you just need 1 out of many possible paths to your goal. Plan broadly, then zoom in on specific tasks, timelines, issues etc. *Put the plan on paper* so everyone knows what to do and how to measure progress.

Execute to completion. Constantly check that your goals and tasks are aligned, i.e. you're on-track. Develop good work habits and use metrics to track your progress.

3. Be Radically Open-Minded

The subconscious, primal part of our brain (amygdala) is constantly fighting with the conscious, rational part of our brain (pre-frontal cortex). Our *ego* leads us to reject our mistakes and weaknesses. We also tend to react defensively when others point out our *blind* spots. When your emotions hijack your logic, you act irrationally. Be radically open-minded and overcome your ego and blind spots:

- *Be open to opposing views*. Invite others to tell you if you're wrong. Temporarily suspend your judgement to see others' perspectives. Realize that you don't know everything, and it's better to know the truth than *appear* to be right or smart.

- Seek to find the *best possible answer*, not just *your* best answer. Gather all relevant info, *then* decide. Learn before trying to espouse your views.

- Watch for signs of *closed-mindedness vs open-mindedness*:

Signs of close-mindedness	Signs of open-mindedness
Get angry when challenged	Curious about reasons for disagreement
Make statements	Ask genuine questions
Focus on being understood	Focus on understanding others' views
Stop others from talking	Encourage others to share their views
Hold only 1 view at a time	Can consider ≥2 conflicting ideas

Use these practices to develop radical open-mindedness:

KEY QUOTES

"Designing precedes doing."

"Lose sight of the why and you will surely lose sight of your goals."

"To be effective you must not let your need to be right be more important than your need to find out what's true."

"Everyone makes mistakes. The main difference is that successful people learn from them and unsuccessful people don't."

- Use *thoughtful disagreement* to figure out the truth. Express your desire to understand the situation and invite the other party to do the same. Be calm and reasonable, focus on facts and the big picture, and show that you're actively considering others' views.

- *Triangulate with smart, believable people*. Someone is believable if he/she has a proven track record of ≥3 successes in an area and can explain how it was achieved. To educate yourself on a topic, interview several experts or get them to have a thoughtful disagreement.

- Mental pain is a sign that you're attached to an idea. Use meditation to calm yourself down and do *quiet reflection*.

- Check if your decisions are supported by *robust facts*.

4. Understand how people are wired differently

We think and see the world differently because our brains are wired differently. To manage people, you must first understand them.

- *All attributes can help and harm you*, e.g. a goals-oriented person may be so driven that he fails to savor the present.

- *Our brains can be trained* for better performance. Each time you do/learn something, you create or strengthen certain neural connections to shape your brain.

Learn to manage your brain and internal conflicts:

- Connect your *conscious and subconscious minds*. Relax, "catch" your subconscious impulses (e.g. fear, defensiveness) as they surface and consciously choose to act logically.

- Reflect on the causes for your uncontrolled emotional outbursts to reconcile your *feelings vs rational thought*.

- *Choose and develop good habits*.

- Tap on the strengths of both the *left-brain and right-brain*. The former is stronger in linear analysis (e.g. facts, planning) while the latter is stronger in lateral thinking (e.g. creativity, stories).

KEY QUOTES

"Smart people who can thoughtfully disagree are the greatest teachers."

"People who don't learn radical open-mindedness don't experience the metamorphosis that allows them to do much better."

"It doesn't matter what you do with your life, as long as you are doing what is consistent with your nature and your aspirations."

Use psychometric assessments to get a more accurate, complete picture of people. Bridgewater uses 4 key tools to identify introversion vs extroversion, intuiting vs sensing, thinking vs feeling, planning vs perceiving, task-focus vs goal-focus, and ideal roles for various archetypes. Experiment to find your own blend of tools.

Knowing how you/others are wired helps you to put the right people in the right roles to support your goals. Dalio believed that his ideal successor should be a "Shaper", an archetype that's visionary, practical *and* determined, thus effective in various roles from visualization to actualization.

5. Learn to make decisions effectively

Learn "what is" before deciding "what to do". To make good decisions, you must have facts/knowledge about the situation, visualize possible paths forward, *then* choose the best path.

- *Synthesize the current situation*: learn from believable and informed people, and differentiate fact from opinion.
- *Synthesize the situation over time*: plot data points over time to see a more complete picture.

  (i) Consider the rates of change, the levels involved, and the relationships between them, e.g. a change from 21% to 25% is an "improvement", but still way below 100%.

  (ii) Don't be a perfectionist. You can usually make good decisions with just 5-10 key factors. It's also faster to use approximations to discover what's true *by-and-large*, e.g. to estimate 40x10 instead of calculating 39x11. Focus on 20% of causes/effort that generate 80% of value.

- *Navigate levels of reality effectively*, like how you zoom in/out of Google Maps to see the path to your destination. Connect the sub-points to the main points and map out decisions at various levels to ensure they're consistent.

Use these practices & principles to make good decisions:

- Use *logic & evidence*, not emotions or animal instincts.
- Calculate the *expected value* of each option by assessing the probability vs reward if you're right vs wrong. Try to raise your probability of being right to raise the potential value.

KEY QUOTES

"Organizing people to complement their strengths and compensate for their weaknesses is like conducting an orchestra."

"Learning must come before deciding."

"Listening to uninformed people is worse than having no answers at all."

"To see how the dots connect through time you must collect, analyze, and sort different types of information, which isn't easy."

"Reality exists at different levels and each of them gives you different but valuable perspectives."

"Anything is possible. It's the probabilities that matter."

- Sometimes, it's better to wait. Weigh the cost of *not deciding vs gathering more info*.

- *Use principles* to simplify and improve your decisions. Slow down and take note of your decision-making criteria → Write down the criteria as a principle → Test the principle in similar situations → Translate principles into algorithms (so you can use computers to test scenarios and check your decisions).

Part 2: Work Principles

Any organization is a machine made of 2 parts—culture and people—that influence each other. Great organizations have *great people* (with character and capabilities) and a *great culture* (where problems and disagreements are surfaced/resolved and new solutions are created). Ideally, align your work with your passions, and to do it with people you want to build a future with.

As an organization grows from 5 to 500, it faces drastically different issues. Apply the 5-Step Process at an organizational level to refine your machine. **In this section, we'll address principles to (i) get the culture right (Principles 1-6), (ii) get the people right (Principles 7-9) and (iii) build/evolve your machine (Principles 10-16).**

1. Adopt Radical Truth & Radical Transparency

In an idea meritocracy, everyone has a responsibility to ask questions and speak up to uncover the truth and best path.

- *Radical truth* is about putting forth your thoughts/questions honestly without filtration. *Radical transparency* is about giving most people the ability to see almost everything.

- *There's more to fear from untruths than truths*. Build a culture where everyone will ask "is it true?" and voice their opinions honestly. Discuss issues openly until you're fully in sync. Never condone deceit nor complain about people behind their backs.

KEY QUOTES

"In order to have the best life possible, you have to: (1) know what the best decisions are and 2) have the courage to make them."

"For any group or organization to function well, its work principles must be aligned with its members' life principles."

"In order to be great, one can't compromise the uncompromisable."

"The more people can see what is happening—the good, the bad, and the ugly—the more effective they are at deciding the appropriate ways of handling things."

Radical truth and transparency require people to face and share the harsh truths while managing huge amounts of info. But if done right, it delivers **trust, learning and better decisions**.

- *It minimizes speculation, politics and bad behavior*. Bridge water records its meetings so everyone can understand how decisions are made. People are more responsible when they know everyone can see what they say/do.

- *Transparency comes with responsibility*. Exclude, penalize or fire people who mismanage or misuse the system.

- *Radical transparency ≠ total transparency*. You can make rare exceptions, e.g. exclude private info that doesn't impact the community, or info that can hurt the organization's long-term interests.

2. Nurture Meaningful Work + Meaningful Relationships

Meaningful work and meaningful relationships reinforce each other. When people trust and care for each other, enjoy being together, and push each other to excel, they thrive as a community and weed out bad people who mean harm to the organization.

Establish clear, non-negotiable values/standards. Give more consideration to others than you demand from them. Respect others' ways of doing things so long as they're consistent with the principles and mission. Focus more on others' merits, not your own.

Meaningful work is not just about money, but you must still pay for work. Define the quid pro quo clearly, with some give-and-take (e.g. pay variances to match work quality/hours). However, people are not *entitled* to your generosity, nor are you *obliged* to be equally generous to everyone.

Build loyalty to the organization/mission, not to individuals. Watch out for people who put self-interest over organizational interest.

3. Make it a cultural norm to learn from mistakes

Build a culture where it's normal to lay out, analyze and learn from mistakes, and unacceptable *not* to do so. Focus on

KEY QUOTES

"The higher the percentage of people who really care about the organization, the fewer the number of bad people there are."

"For most people, being part of a great community on a shared mission is even more rewarding than money."

"Create a culture in which it is okay to make mistakes and unacceptable not to learn from them."

your evolution. Don't penalize mistakes, but instead use failures as feedback to refine your approach until you succeed. Help capable people to reflect/learn from mistakes; remove incapable people and those who won't embrace mistakes.

Focus on achieving your goal and outcomes, not on looking good. Emphasize accuracy and results, not credit or blame. Document your mistakes, connect the dots and find patterns to uncover underlying weaknesses. Tackle 1 top weakness at a time.

Teach everyone to use pain as a signal for reflection: calm themselves, do self-reflection, and overcome biases and blind spots through honest feedback and open-mindedness.

While it's good to learn from mistakes, be explicit on unacceptable mistakes that're too costly. Build measures to prevent them.

4. Get People in Sync

Conflict can bring people closer by surfacing and resolving differences. Get people to list down the areas ofdisagreement and tackle them in order of priority (starting from those that involve values or decision-making processes).

Use thoughtful disagreement to resolve conflict and uncover the truth. To do this, people must be open-minded and assertive, i.e. express their views clearly, see others' view-points, learn and adapt. If you're misunderstood, assume you have been unclear. Give decision-making authority only to open-minded people.

If you're responsible for a meeting, run it well:

- *Set the context* (e.g. who's in charge, objectives). Pick participants who can add value to the decision (not those who think like you).
- *Direct the meeting* to achieve the goals: balance different views, navigate across levels, ask "is it true?", and use the 2-minute rule to manage disruption (i.e. let each person speak for 2 min without interruption).
- *Complete* each topic before moving on to the next. Conclude by stating the agreement and who to follow-up on what by when.

KEY QUOTES

"Every mistake that you make and learn from will save you from thousands of similar mistakes in the future."

"What you learn about each other will either draw you together or drive you apart."

"Their bad behavior doesn't justify yours."

"Conversations that fail to reach completion are a waste of time."

- *Leverage communication* to share the outcome with large numbers of people (e.g. record your meetings, use FAQ boards).

Typically, groups are less effective when they're too large; small groups of 3-5 are the most synergistic. Prioritize your relationships based on value-alignment.

5. Use Believability-Weighted Decision-Making

In an idea meritocracy, you must be able to evaluate each idea's merit. Believable opinions are more likely to yield good outcomes. Be a student, teacher, or peer (ask questions, teach, or debate) depending on the other party's believability relative to yours.

Pay attention to the data and reasoning behind conclusion.

- Weigh an idea based its *probability of being right*. An experienced person who can't explain the reason for his opinion can be less believable than an inexperienced person with a sound, testable theory.
- Approach only relevant, believable people for insights and create your system to *calculate people's believability*. Bridgewater uses Baseball Cards (with adjectives and scores to describe what people are like) and the Dot Collector app (which tracks people's past successes).

Use your limited time to manage differences efficiently. Dalio recommends picking just 3 believable people for inputs. When you want the *best answers*, involve the most relevant people (e.g. your managers, direct reports and/or agreed experts), but when you want to *educate* or *unite*, involve a wider range of people regardless of their believability. If something is important, invest the time/effort to get in sync; otherwise just let it go.

Believability-weighting is a tool to help decision-makers; it doesn't overrule or remove their responsibility. As the decision-maker, you should adopt the believability-weighted choice unless you can pin-point why your own opinion is different and worth the risks.

KEY QUOTES

"While the believability-weighted answer isn't always the best answer…it is more likely to be right than either the boss's answer or an equal-weighted referendum."

"Dealing with raw opinions will get you and everyone else confused; understanding where they come from will help you get to the truth."

"It's more important to do big things well than to do the small things perfectly."

6. Have an agreed resolution process

This is essential in the event people can't resolve a conflict on their own. Escalate the dispute to an agreed third-party or have a believability-weighted vote. *Everyone* must follow the process strictly—any change can only be made after a proposal is made and approved at an organizational level.

A right to debate ≠ a right to make decisions. Once an issue is debated and decided, *everyone* must stand behind the final decision. Give decision-making power to people who will put organizational interests above self-interests.

7. WHO comes before WHAT

Ensure the right person is on the job, before you worry about what should be done. Define the goal → Give the goal to people who can achieve it → Hold them accountable → Replace them if they fail despite training & learning opportunities.

If you have the right Responsible Parties (RPs) with clear accountability, they'll find a way to achieve the goals. Always align individual incentives with responsibilities and outcomes. Everyone must report to someone (even owners must satisfy their clients and employees).

8. Hire right…You pay dearly for wrong hires

Match people to your machine's design, not vice versa. Get crystal clear on the exact type of person you want and develop the methods to evaluate those attributes.

- *Define what's required* to do a job well, in this order of priority: (i) *values* (deep-set beliefs that decide if people will fit in), (ii) *abilities* (how they think/act) and (iii) *skills* (learned tools e.g. language).
- Only choose the right person with an outstanding track record and *fits the role* so well you can almost hear a "click".
- Develop a *systematic, scientific hiring approach*. Document the best interview questions, non-verbal cues to watch for, etc. Use personality assessments to get a more objective

KEY QUOTES

"Principles are like laws—you can't break one simply because you and someone else agree to break it."

"While all individuals have the right to have their own opinions, they do not have the right to render verdicts."

"Change the people and you change how things develop."

"If you're less than excited to hire someone for a particular job, don't do it."

picture. Choose interviewers who can relate to the people you want (e.g. use a visionary interviewer for a visionary role, or a group of interviewers who collectively possess the range of desired qualities).

Pay attention to track records—they help you to figure out what someone is like and what you can expect from them. Examine if the person has the *required values*, *abilities* and *skills*, and has succeeded in those areas ≥3x. Use reference checks; don't just rely on the candidates' inputs. Look for both capability *and* character.

Don't just hire for current job-fit. Hire people you want to build a future with, i.e. they share your values/mission, will push you to improve, and want to join you despite knowing the challenges. Offer them stability and opportunity. Pay slightly above market with extra performance-based rewards to motivate them to work hard and grow the pie. Build partnerships based on mutual generosity and consideration.

9. Train, test, evaluate and sort people continuously

You can't create a perfect career plan from the start. You must discover people's preferences and strengths/weaknesses by training and testing them in specific roles. To manage the personal evolution process, give people new assignments, have periodic reviews, and keep moving them to more suitable roles.

- It usually takes 6-12 months to roughly gauge a new hire, and *18 months* to integrate him into the culture.
- *Hands-on experiences* are more effective than book learning. Ideally, have ≥2 believable trainers per trainee so they can triangulate their views. Don't dictate how people must do things; let them make acceptable mistakes and use these opportunities to get in sync.
- *Offer constant feedback* on what works/doesn't work. Look at both successes and failures to uncover truths about what they did well/badly and why. Be precise and accurate. Clarify that the feedback is to facilitate learning and doesn't affect performance rating.

It's easier to give compliments and rewards. But in the long run, tough love is more valuable: give people constructive

KEY QUOTES

"Pay people enough so that they're not under financial stress, but not so much that they become fat and happy."

"The greatest gift you can give someone is the power to be successful."

criticism and the chance to learn from mistakes. Define clear rules and use metrics to track performance against those rules.

Your goal is to know how people are like, so you can place them in the right jobs.

- Use tools (e.g. metrics, reviews, surveys) to capture people's performance from various angles, then connect the dots to get a *full picture* of a person.

- Assessments should be a *joint effort to uncover the truth*, not 1-way judgments. Both reviewer and reviewee must agree on the assessment. Give specific feedback regularly, then connect the dots with periodic reviews. Look at outcomes and processes.

- *Help people* to (i) know their shortcomings and root causes, (ii) feel motivated to change, and (iii) know how to improve.

Uphold the standards. If someone can't make the cut, let him go.

- It's easier to equip people with skills than to change their values and abilities. If someone is failing due to a *lack of values/abilities*, it's better to let them go.

- Continuously *evaluate employees* throughout their career. At each point, ask if you'd hire them knowing what you now know.

10. Run your machine as a manager/designer

At a high level, any role involves setting goals and creating systems to achieve them. Don't get lost in daily tasks.

- Be an *organizational engineer*: see how the parts are connected, measure their performance, and improve the overall design.

- Diagnose if gaps in performance are due to a *design flaw or people issues*. Study repeated problems to find the root causes.

- *Build metrics* to answer the most vital questions and give an overview of how well your machine is working.

- Treat everything as a case study to *develop principles* for future decisions. Consider *why* something occurred at a

KEY QUOTES

"You reach a point in all relationships when you must decide whether you are meant for each other."

"Great managers orchestrate rather than do. Like the conductor of an orchestra, they do not play an instrument, but direct their people so that they play beautifully together."

machine-level, then consider *what* to do at the case-level. Use higher-level principles to guide lower-level ones.

Manage for results: (i) manage others effectively, (ii) step down to address something not being done well, and (iii) escalate things if you can't handle it.

- *Know people well to use them well*. Don't delegate to someone unless you know they can handle the job.
- Ensure people are *clear about their responsibilities*. Get everyone to think like an owner, e.g. they must still ensure things work well while they're on vacation.
- Set clear expectations, *hold one another accountable* for results, and push yourselves beyond your current limits.

Probe deeply to know what to expect from the machine. To anticipate problems before they occur, you need (i) a minimum level of knowledge in an area and (ii) close rapport with people. Get daily updates from your direct reports to stay on top of their activities, issues and reflections, and go beyond direct reports to see a fuller picture. Probe transparently and welcome others to probe you too.

Great leadership is about (i) uncovering the best decisions/ answers and (ii) bringing people along on the discovery process.

- Don't insist that people follow your instructions. Instead, help people get in sync and *align their tasks and goals*.
- *Tailor your approach* for each person based on what they're like and their circumstances. Be principled but care for people.
- Communicate *plans* clearly and measure your progress.
- Anyone who can't cope has the responsibility to *escalate it* so the manager can decide what to do.

11. Don't Ignore or Tolerate Problems

If you aren't somewhat-paranoid about maintaining excellence, small issues will eventually snowball into real problems.

KEY QUOTES

"There is no greater failure than to fail to escalate a responsibility you cannot handle."

"Don't treat everyone the same—treat them appropriately."

"Making sure that little problems don't exist is important because, if they're allowed to continue, they will grow into big problems."

Have someone responsible for designing and overseeing your machine. Ideally, find people with high standards, are good with metrics, can probe deeply into issues and synthesize well.

- Beware of *creeping problems* that you may have gotten used to. Any gaps between your goals and outcomes can signify problems.

- *Involve everyone*. Invite feedback and encourage people to surface problems. Get everyone to *check their own outputs*.

Pinpoint the specifics (e.g. names and specific events). Don't generalize using "we" or "they". Tackle tough problems with the what-who-when approach: what's the problem, who's responsible, and when you should discuss it.

12. Diagnose Problems Root Causes

Ask good questions, e.g. Is the outcome good or bad? If it's bad, is it due to an incapable Responsible Person (RP) or bad design? Who should do what differently?

- Identify where the failure occurred in the *5-Step Process*. Consider if any *principles* were violated and how you can use principles to prevent similar occurrences.

- Consider *what was known* at the time the decision was made (not what you know now).

If you know a department has problems, "**drill-down**" to identify the root causes using the 80/20 rule. List down the key problems → List down the causes for each problem → Keep asking "Why" to identify root causes → Create a plan → Execute it.

Do ongoing diagnosis to see patterns/trends over time. Seek inputs from believable people.

13. Keep improving your machine design

Design is an iterative process—you must repeatedly test different people and processes, then refine accordingly. Translate criteria → principles → algorithms so you can apply principles consistently. Make tactical adjustments without losing your strategic goals.

KEY QUOTES

"It's one thing to point out a problem; it's another to have an accurate diagnosis and a quality solution."

Build the machine/organization around goals, not tasks.

- Provide *strong oversight* using believable people who have high standards and specific knowledge/skills. Keep the ratio of managers to direct reports to around 1:5 and no more than 1:10. Hire managers before hiring their reports.

- Assign the right people to the *5-Step Process*, e.g. a Visionary to set goals, a Detective to diagnose problems, etc.

- *Make departments self-sufficient* and accountable for their resources. It's ok to temporarily share resources between functions if you're small, but don't merge the responsibilities.

- Cater for *succession & training*, e.g. selecting/training/monitoring new leaders, preserving your culture and values. For mission-critical tasks, it's better to "double-do" (have ≥2 people do the same task) rather than "double-check".

Your org chart should look like pyramids within a pyramid, with minimum layers and no crisscrossing of lines.

- Have *clear reporting lines and responsibilities*, both within and between departments. Avoid dual reporting if possible. All cross-functional work must be pre-agreed between the leaders.

- Ideally, put people in roles where they'll naturally excel. But if needed, you can create *guardrails* (e.g. pair up with someone to cover blind-spots).

Install controls against dishonesty. Have auditors enforce your laws, then audit the auditors. Do transparent investigations and "public hangings" to make consequences obvious.

14. Execute your plans

Connect your tasks to exciting goals. Manage and motivate people to move in sync. Plan before you act. If you get stuck, step back, triangulate and look for creative solutions.

Don't just work harder. See things at a higher level to (i) prioritize, (ii) delegate to the right people and (iii) improve your productivity.

Use checklists to ensure you complete your tasks, while setting your sights on your wider goals/responsibilities.

KEY QUOTES

"An organization is the opposite of a building: Its foundation is at the top, so make sure you hire managers before you hire their reports."

"If you're not excited about the goal that you're working for, stop working for it."

Set aside time to rest and rejuvenate, and celebrate when you achieve your goals.

15. Use tools and protocols to shape habits

The only way to change behaviors is to practice something until you internalize the lessons and form habits. To run an idea meritocracy, you need tools to collect, process and present data in a way that facilitates learning, decision-making and action.

To help you design your own tools/protocols, Dalio describes Bridgewater's tools and protocols in an Appendix. These include coaching, the Dot Collector app, baseball cards, daily updates, manuals, metrics, etc.

16. Pay attention to governance

Governance is the system of oversight, with checks and balances to safeguard an organization's interests and principles.

- Besides meritocracy, consider other vested interests for *assigning responsibility and authority* (e.g. owners may have certain veto rights to protect their interests).
- *No one should be above the law* or irreplaceable. Loyalty to a boss or unit must never supersede that to the organization.
- Clearly lay out the reporting lines, decision-making rights, and the layers of oversight. People responsible for oversight must have (i) full info on the people they're checking on, (ii) the ability to make sound assessments, and (iii) no conflicts of interest. *Decision-makers* must be trustworthy enough to have all relevant info.

Other Details in the Book to Look out For

This is a voluminous book. Dalio presents more than 500 principles, broken down into higher-level principles, mid-level principles and sub-principles, many of which are inter-related. In this summary,

KEY QUOTES

we've consolidated the principles and key ideas. You can get deeper insights by reading the principles alongside Dalio's detailed personal journey.

These Principles are not meant to be a magic formula, but a resource to help you develop your own Life and Work Principles. For more details, tools and resources, pls visit www.principles.com.

About the Author

Raymond Dalio (born 1949) is an American billionaire investor, hedge fund manager, and philanthropist. He's the founder, co-chairman and co-chief investment officer of investment firm Bridgewater Associates, one of the world's largest hedge funds. In Feb 2020, Dalio was ranked by Bloomberg as the world's 79th-wealthiest person.

Dalio began investing at the age of 12. He received a bachelor's degree in finance from Long Island University and an MBA from Harvard Business School. Thereafter, he worked as a trader, as the Director of Commodities at Dominick & Dominick LLC, then a futures trader and broker at Shearson Hayden Stone, before starting Bridgewater Associates.

EXPERT SECRETS

The Underground Playbook for Finding Your Message, Building a Tribe, and Changing the World

Russell Brunson

The Big "So What"

Each of us has the potential to inspire, add value, and lead others with our unique talents and experiences. Whether you're an employee or a business owner, this book offers a blueprint to transform your knowledge into a meaningful and profitable business.

Introduction: What is an Expert Business?

There are 2 key steps to achieving true fulfillment in life:

- *Grow yourself*: Start by mastering a skill or area you're deeply passionate about. This could be anything from crafting potato guns to composing sheet music or fixing bicycles. Immerse yourself in the subject, and learn/apply the knowledge to the point you become a true expert in that area.

- *Contribute to others*: There's a limit to how much you can learn on your own. By teaching and sharing your expertise with others, you can deepen your mastery, make a meaningful impact, and make money in the process.

An expert business is about delivering impactful information products. There are **two main ways to build such a business**:

- Share your knowledge *as an expert*, by packaging it into products like courses, coaching, or consulting.

- Using information products to *grow an existing business* quickly:

  (i) By educating customers on the value of your solutions, you prime them for purchase;

KEY QUOTES

"You hold in your hand the step-by-step roadmap to turning those assets into wealth and prosperity."

"Growth is just half of what we need to have true fulfillment in life. The second half of fulfillment comes from contribution."

"I believe the true value of an expert business isn't the money you make, but the people's lives you're able to change through your message."

"You will get all you want in life, if you help enough other people get what they want."
—Zig Ziglar

(ii) By positioning yourself as an authority, you can command a higher price; and

(iii) By attracting large numbers of prospects with free educational content, you reduce your client acquisition cost.

For example, ClickFunnels became a leading SaaS company by first offering educational products that taught marketing strategies. These products concurrently generated revenue and primed customers to use their software to implement those strategies.

In this summary, we'll be presenting the Expert Secrets system in 3 parts:

- Creating Your Mass Movement;
- Installing the Right Beliefs; and
- Monetizing Your Expertise.

Part 1: Creating Your Mass Movement

To make a meaningful impact or build a thriving business, you need a pool of engaged audience—people who trust you, resonate with your message, and are eager to follow your lead.

- A mass movement revolves around True Fans who're deeply passionate about your message. These are the people who buy from you, champion your cause, and eagerly anticipate your next offering. This starts with *finding and serving the right audience*.
- Every successful mass movement is built on *3 key elements*:

  (i) A charismatic leader;

  (ii) A future-based cause; and

  (iii) A new opportunity.

KEY QUOTES

"It's only by shifting our focus to helping others that we continue to grow."

"They say that the best time to plant a tree was 20 years ago, but the 2nd best time is right now."

"A creator, such as an artist, musician, photographer, craftsperson, performer, animator, designer, videomaker, or author—in other words, anyone producing works of art—needs to acquire only 1,000 True Fans to make a living."

"If you jump into an already existing red ocean, you'll be fighting an uphill battle. But if you create a blue ocean, you will find success so much easier."

Identify Your Niche

Define the audience for your mass movement by asking: Who do I want to serve? What unique value can I provide?

- Start with *3 core markets* (Health, Wealth, or Relationships), narrow down to a *submarket*, then a *niche*. For example: Health (core market) → Nutrition (submarket) → High-fat diets (niche).

- Study competitors to identify *gaps or underserved areas* where you can offer a unique solution.

- Avoid a submarket/niche that's overcrowded ("red ocean"). Aim to start a new niche within an attractive submarket by presenting a new opportunity—carve out a fresh "*blue ocean*" with minimal competition, and an audience that'd be excited by your offering.

- Validate your niche. Ensure your audience meets *2 criteria*:

  (i) Irrationally passionate, with signs like: existing communities, events, unique vocabulary, and established experts.

  (ii) Willing and able to spend money i.e. they have both the enthusiasm and resources to invest in your solution.

Become a Charismatic Leader (Whom Others Follow)

Every movement begins with a charismatic leader who embodies the values, aspirations, and identity of the group they lead. People follow you because they see you as someone who's been where they are and can guide them to success.

KEY QUOTES

"You don't want to be the first celebrity in a market. You want a topic or niche with its own subculture already established."

"There are people today who need what you have."

"You don't have to be the most knowledgeable person in the world on your topic, you just have to be one chapter ahead of the people you're helping."

- If you *feel inadequate as an expert*, remember:
  - *You don't need certifications*—your results are proof of your expertise. Tony Robbins, for example, began teaching NLP before he was certified, and transformed millions of lives.
  - *You don't need to be the best*. You can lead your audience so long as you're 1–2 steps ahead of them.

To establish yourself as a charismatic leader:

- *Be relatable and authentic*. Share your transformation journey honestly. Show the human behind the expertise, including your struggles, vulnerabilities, and triumphs.
- *Communicate with certainty*: Certainty inspires trust. Just share your message consistently through blogs, videos, or podcasts. The more you share, the more refined and confident your message becomes.
- *Share bold, polarizing ideas* that capture attention and spark conversation. Aim for the "prolific zone" that's bold but not extreme. For example, Dave Asprey became a multi-millionaire by creating Bulletproof Coffee: a mix of butter and coffee as a weight-loss method. Some people will love your idea while others will hate it—just focus on the true fans and ignore the rest.
- *Persuade with emotion*: Connect with your audience via storytelling, using these actionable steps from Blair Warren's One Sentence Persuasion framework:
  - Show how your idea helps them to *achieve their dreams*;
  - *Justify their failures* by blaming outdated systems/methods.
  - *Address their fears* and inspire hope with relatable stories and solutions.
  - *Validate their suspicions* about existing solutions to make them feel understood and smart.
  - Use an us-versus-them narrative to *target a common enemy* (e.g. flawed systems or competitors).
- *Show genuine care for their success*. Remember: you're actually helping your audience by charging for your services, since

KEY QUOTES

"The gap between where they see themselves and where they see you is what moves them to action and helps them make the necessary changes."

"In any situation, the person with the most certainty wins."

"If you haven't offended someone by noon each day, then you're not marketing hard enough."
—Dan Kennedy

"People will do anything for those who encourage their dreams, justify their failures, allay their fears, confirm their suspicions, and help them throw rocks at their enemies."
—Blair Warren

"They don't care how much you know until they know how much you care."

they're more likely to value and act on the information you provide.

- *Deliver real value that matters to them*, be it connection or tangible results like weight loss or financial stability.

Craft a Future-Based Cause (to Form Your CULT-ure)

People are driven by the promise of a better future. Articulate an inspiring vision that's bigger than yourself—something that rallies your audience and motivates them to take action.

- Use *clear, motivating slogans* that serve as a rallying cry and show the possibilities ahead. For example, ClickFunnels created the slogan "You're Just One Funnel Away..." to inspire users to envision how a single funnel could transform their lives—be it achieving financial freedom or building a thriving business.
- Show that a seemingly-impossible goal is actually *achievable*. Highlight tangible milestones that other community members have achieved, e.g. ClickFunnels' "2 Comma Club" celebrates members who've earned >$1mil using their funnels. This offers proof of success others to strive toward similar goals.
- Use statements or labels that members can adopt as part of their *personal brand/identity*, e.g. "I'm a ___" or "I___."
  - For example, ClickFunnels users proudly declare, "I'm a Funnel Hacker." When Brandon and Kaelin Poulin rebranded their company from "Tuell Time Trainer" to "Lady Boss," their fans started to call themselves "Lady Bosses."
- *Create a "Title of Liberty"*—a unifying statement or symbol that reminds your community of their purpose, identity, and actions. There are 3 ways to create this:
  - A *mini-manifesto*: a short, impactful phrase that captures the group's identity and purpose, e.g. "I am a Funnel Hacker. I define my destiny..."
  - A *manifesto*: a detailed declaration of beliefs and values explaining what the group stands for and opposes.

KEY QUOTES

"Those who pay, pay attention—and the more they pay, the closer attention they pay."

"Our job as expert and leader is to help bring people to higher ground. To move them from where they are to where they want to be."

"The certainty people get when they see someone else do something they thought was impossible, gives them the belief they need to also achieve that same goal."

"Fear of the future causes us to lean against and cling to the present, while faith in the future renders us perceptive to change."

- A visually-engaging *video* that summarizes the cause, who you are (and why you're different), what you stand for, who you stand against, and why your movement matters.

Introduce a New Opportunity (or the Vehicle for Transformation)

The new opportunity serves as a vehicle for transformation, offering your audience something fresh and exciting, rather than fixes or improvements to existing methods. New opportunities work because:

- People are drawn to things that *improve their status*, but avoid things that lower their status. Improvement-based offers remind people of past failures and shortfalls, threatening their self-esteem and status. New opportunities shift the focus from fixing old problems to embracing new possibilities—they promise progress and the chance to raise their status (e.g. feel smarter, wealthier, more successful) without the stigma of past failure.
- New opportunities create a "blue ocean" with little competition, *avoiding price wars in saturated markets*.

For example, Steve Jobs revolutionized the music industry by introducing the iPod—a groundbreaking device—rather than improving existing MP3 players.

There're 2 strategies to position your offer as a new opportunity:

- *Opportunity switching*: Introduce your audience to a completely new method/approach that gives them hope for a better future.
- *Opportunity stacking*: Enhance your new opportunity by offering additional tools or products to support the transformation.
- An offer can be *both a switch (for beginners) and a stack (for advanced users)*. For example, Brunson introduced expert businesses as an opportunity switch for busy working professionals to leverage their expertise for income. He then positioned ClickFunnels as part of the opportunity stack, offering tools to implement and scale their expert businesses.

KEY QUOTES

"Status is the only thing that causes people to move toward you or not move at all."

"Our goal is not to fix what's not working. Our goal is to REPLACE what's not working with something better."

"Your job as the expert is to load up the elevated status side of the scale and decrease the risk of failure."

"It matters less what product they are buying; it's more important to understand that they are leaving behind whatever old beliefs they had about how to achieve their desired results and putting their hope and faith into this new opportunity."

Follow these steps to create a new opportunity:

- *Work with a small group of ideal clients for free*. Aim to deliver measurable results and collect testimonials to build credibility.

- *Design a six-week masterclass*: Teach your audience how to achieve their desired result using the new opportunity. Treat this as a beta program to refine your ideas before targeting paying clients. Six weeks is an ideal duration, since you risk refunds for shorter periods, and may receive complaints (about time commitments) for longer ones.

- *Develop marketing materials first*, before designing the masterclass, to ensure your messaging is clear and relevant.

  (i) *Who/What statement*: Define your audience and results, using this format: "I'll teach [*specific submarket audience*] *how to [specific niche outcome*]." For example, "I will teach introverted men how to confidently approach and attract their dream partner."

  (ii) *Opportunity switch title*: Highlight the result for your masterclass in this format: "How to [*result they want most*] Without [*pain they fear most*]". For example, "How to Lose Weight Easily Without Giving Up Your Favorite Foods."

  (iii) *Curiosity hook*: Use 5 compelling angles to differentiate your masterclass.

  - *Little-known, big differences*: Showcase a fresh, impactful concept, e.g. "There's a little-known hormone called ghrelin that controls your hunger. It can transform your weight loss journey."

  - *Well-known, little understood*: Expose hidden truths about familiar ideas e.g. "Everyone knows about counting calories, but few know that meal timing can turbocharge your metabolism."

  - *This changes everything*: Present a breakthrough that revolutionizes the market e.g. "Tired of traditional weight-loss plans? A groundbreaking approach uses personalized meal timing to reset your metabolism effortlessly."

KEY QUOTES

"Most people design the class first and then think about marketing, but that is a formula for disaster."

"By changing your positioning, you'll pull your opportunity out of a red ocean and plunk it down into a blue ocean."

- *The crystal ball theory*: Frame old methods as outdated and your solution as the future e.g., "Counting calories is outdated. The future lies in personalized metabolic tracking for faster and lasting weight loss."

- *Revisiting the fundamentals*: Offer a simpler alternative e.g. "Forget complicated meal plans. To lose weight sustainably, you just need to balance food portions.

- Don't assume you know what your audience wants/needs. *Ask what they want* using surveys or questions, then create targeted solutions that resonate with your audience. Remember: People buy what they want, not necessarily what they need.

  - Create a survey or ask: "What's your #1 question about [niche/topic]?" with an incentive to respond, e.g. free access to your masterclass.

  - Share the survey with friends, Facebook groups or social media communities (but be sure to add value before asking), and/or using paid ads (for faster responses).

  - Collect 100+ answers and identify 8-10 recurring themes. Use them to craft your masterclass outline and module titles.

  - Create benefit-driven bullets for marketing, based on the audience's language. If people are asking "What's the best way to save time meal prepping?" and "How to stay on track when I'm busy?" then title your course "How to Prep Healthy Meals in Under 30 Minutes—Even on Your Busiest Days!"

- *Deliver your free masterclass*:

  (i) Create a private Facebook group to engage participants, share updates, and provide bonuses.

  (ii) Host sessions using platforms like Facebook Live, Zoom, or GoToWebinar.

KEY QUOTES

"Because we're the experts in our respective niches, it's easy to assume we know what people want. And while sometimes we may be right, more often we miss the mark."

"People don't buy what they need, they buy what they want."

Part 2: Installing the Right Beliefs

To persuade your audience to embrace your new opportunity, you must use masterful storytelling to transform their beliefs.

Craft a Big Domino Statement

The Big Domino is the one key idea or belief your audience must accept for them to take action without objection or hesitation.

- Use this *structure* for your Big Domino statement: "If [*new opportunity*] is the key to [*what they want most*] and it's only attainable through [*your specific vehicle*], then all objections become irrelevant."
  - For example: "If funnels are the key to online business success and they're only attainable through ClickFunnels, then all objections become irrelevant."
- *If your Big Domino feels weak*, you might be offering an improvement, not a new opportunity. Make sure you have a unique vehicle that replaces mainstream solutions.

Develop Epiphany Bridge Stories

Once you have a Big Domino statement, the next step is to build belief around it through storytelling. Epiphany Bridge stories help you to connect emotionally with the audience and shift their beliefs.

- People *make decisions emotionally*, then justify them logically. If you can lead them to experience your emotional epiphany, they will fill in the logic themselves.
- Use a *backstory* to recreate the breakthrough "aha" moment when you discovered the new opportunity, with *additional stories* to dismantle other false beliefs or objections preventing them from accepting the Big Domino.

KEY QUOTES

"Everything comes down to one thing—belief. Belief creates the customer. Belief creates the results."

"You must persuade people to believe in what you are doing, and you do that by mastering the art of storytelling."

"The first step to creating belief is figuring out the ONE THING you have to get someone to believe that will knock down all their other objections, make them irrelevant, or disappear altogether."

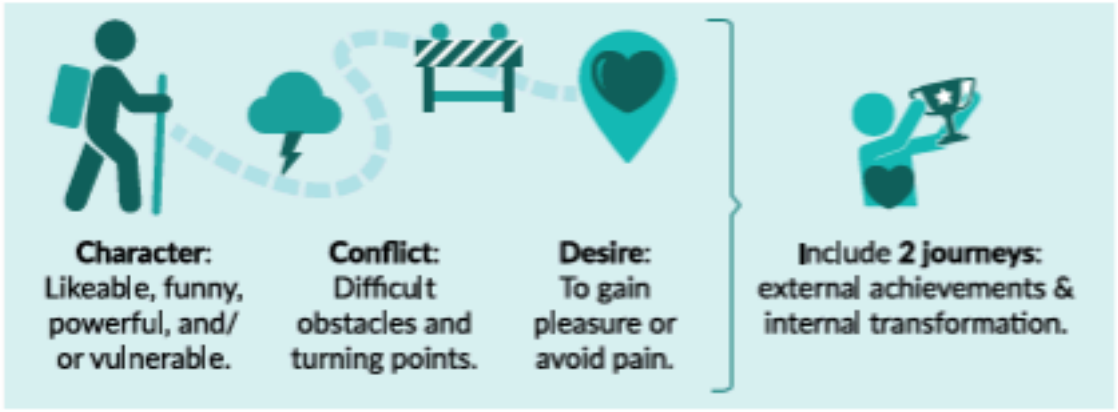
"The first step to creating belief is figuring out the ONE THING you have to get someone to believe that will knock down all their other objections, make them irrelevant, or disappear altogether."

"There's a time and a place for logic, but you have to convince them emotionally first, before they'll be excited by your logic."

Use these tips for effective storytelling:

- Use *simple, relatable language* (at third-grade level).
- *Describe emotions vividly* so your audience can experience your breakthrough.
- Use *analogies or comparisons* to explain unfamiliar concepts, e.g. "Funnels are like highways that guide your customers straight to their destination."

Every good story follows a plot structure like this: "[*Character*] wanted to [*Desire*], but [*Conflict*]." Use this to tell the backstory of how you first got excited about the new opportunity.



- The *character* is the hero of the story (you or someone else). To be relatable, they should be likeable, funny, powerful, a victim of external forces, and/or in a vulnerable position.
- *Desire* refers to what the hero wants to achieve, which could be to:
  - (i) Gain pleasure, e.g. win love/status or retrieve something valuable.
  - (ii) Avoid pain, e.g. escaping failure or trying to stop a disaster.
- *Conflict* refers to the seemingly-insurmountable obstacles that create emotional tension. Most films include 5 turning points:
  - (i) New opportunity/event that triggers the hero's journey.
  - (ii) Change of plans as the hero crystallizes a clear, specific goal.
  - (iii) Point of no return, where the hero fully commits to a high-stakes situation.
  - (iv) A major setback that makes success seem impossible, but they make one final push toward a sliver of hope.

KEY QUOTES

"Using big words may make you feel smarter, but it will not influence others."

"Any time you're speaking (or writing) and you hit a friction point where some people may not understand what you're trying to convey, just say "it's kinda like..." and relate it to something easy to understand."

"Every good story is about a captivating character who is pursuing some compelling desire and who faces seemingly insurmountable obstacles to achieving it. That's it. If you've got those three things, then you've got a good story."
—Michael Hauge

"Our primary goal as storytellers is to elicit emotion, and you can't do that without conflict."

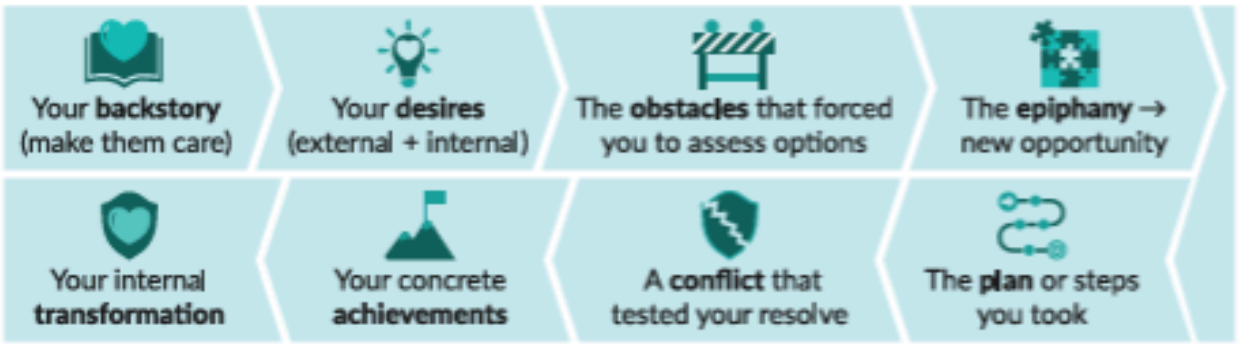
(v) The climax, as the hero overcomes the greatest obstacle to achieve external success and internal transformation.

- A relatable and emotionally-engaging story must include 2 *journeys* that the hero undertakes:

  (i) The *Journey of Achievement*: the external, tangible goal the hero seeks, e.g. "to earn enough to support my family."

  (ii) The *Journey of Transformation*: the internal and emotional transformation the hero experiences along the way, e.g. "I overcame my limiting beliefs about money and discovered my true potential."

Use these 8 steps to take your audience through the hero's two journeys and incorporate the elements above:



- Share your *backstory* to make the audience care. Show that you were once where they are now, e.g. "I was a broke college student selling potato gun DVDs to support my family."

- Share what you *desire* to achieve, including both external and internal struggles, e.g. "I wanted to support my wife and feel like a good husband, but I struggled to earn enough money."

- Tell the *obstacles* that forced you to reassess your current option, e.g. "Google ad costs skyrocketed and shut down my only income source."

- Describe the aha moment (*epiphany*) that revealed the new opportunity, e.g. "I discovered sales funnels and realized they could increase customer value."

- Show the *plan* or steps you took, e.g. "I started building funnels for profitable markets like weight loss."

- Share a *conflict* that tested your resolve and pushed you to the point of no return, e.g. "Funnels were costly and my success rate was low. Soon, I maxed out my credit cards and had no choice but to make the next funnel work."

KEY QUOTES

"While we want our hero to achieve his goal, it's more important that he becomes someone different along the way. There has been a death of his internal struggles and a rebirth of something more."

"When they see that you were once where they are now, they will have faith that you can take them where they want to go."

- Reveal what you *achieved*, e.g. "I created ClickFunnels to simplify funnel-building. It became a multi-million-dollar business that helped thousands of entrepreneurs."
- Explain how the journey *transformed* you, e.g. "I achieved financial freedom, discovered my purpose, refocused on my family, and helped others find success."

Address False Beliefs

After hearing your Big Domino and Epiphany Bridge backstory, your audience will still have objections rooted in 3 main false beliefs:

- *Vehicle*: Doubts about the viability of the new opportunity, e.g. "Funnels won't work for my business."
- *Internal*: Doubts about their own ability to succeed e.g. "I'm not tech-savvy enough to build a funnel."
- *External*: Doubts about external obstacles, e.g. "I wouldn't know how to drive traffic to a funnel."

To identify and replace these false beliefs:

- List down all the *false beliefs* your audience might have about your opportunity, e.g. "Losing weight means giving up food I love."
  - (i) List down the experiences that might have led to those beliefs, e.g. "The last restrictive diet made me so miserable."
  - (ii) Sort these into vehicle, internal, and external beliefs.
  - (iii) Identify the top false belief for each category.
- Create an *Epiphany Bridge story* for each false belief to show how you (or someone else) overcame it. For example: "I thought weight loss meant giving up my favorite foods, but then I discovered a plan that lets me eat ice-cream while still losing weight."
- Turn each belief into a *curiosity-driven secret* that hooks interest, e.g. "How to Lose Weight Without Giving Up Your Favorite Foods or Counting a Single Calorie." You should

KEY QUOTES

"When I'm trying to sell someone on my new opportunity, almost instantly their subconscious mind will start thinking about all the reasons it isn't possible, or why it won't work for them. The bad news is that these beliefs can be really strong."

"If I can identify people's false beliefs and tell stories that show them the truth, I didn't need to "sell" them anything. The stories lead people to the right belief, and they sell themselves."

"The better you get at telling the stories, the more effective you'll become at persuading others, and you'll know exactly what to say when customers bring up objections."

have 3 key secrets to counter the top vehicle, internal, and external belief.

Part 3: Monetizing Your Expertise

Having identified your audience, built a movement, and replaced false beliefs, you're now ready to turn your expertise into a sustainable business.

Create an Irresistible Offer (The Stack Slide)

Start by putting together an irresistible offer—a complete package that makes it a no-brainer for your audience to buy.

Create a "stack slide", i.e. a list of valuable items that will help your dream clients to achieve their desired results.

- *Brainstorm as many options as possible*, including:

  (i) Your *core offer* (e.g. the Opportunity Switch masterclass);

  (ii) *Complementary tools* (e.g. templates, checklists, software) to increase their chances of success;

  (iii) Other tools or tangible assets to *address false beliefs*, e.g. case studies, video guides, sample scripts, and cheat-sheets to help them address internal/external obstacles; and

  (iv) An *exclusive bonus* with scarcity and urgency, e.g. "First 20 to enroll before Sunday gets a 2-hr private coaching session."

- Each item has an attached value, and the combined value of the items should be *10x the value* of your asking price. In short, a solution that costs $997 should deliver ≥$9,997 of value.

What you're gonna get...

Masterclass	($9,989 value)
Tools	($989 value)
Tangible#1	($387 value)
Tangible#2	($387 value)
Tangible#3	($387 value)
Bonus	(Priceless)

Total Value: ~~$12,139~~

Price: $1,039

KEY QUOTES

"Before I ever start selling anything, my first step is to create an irresistible offer."

"If you believe in the product or service you're selling, then you have a moral obligation to try and serve your customers in every way possible."
-Jay Abraham

"Think of it not as the value you'd sell it for, but the value they get from it. What will the results from each element be worth to them?"

The Perfect Webinar Script

This is a proven 4-part framework that you can use for presentations, webinars, sales videos, or email sequences. It gets the audience to believe in the Big Domino and to take action.

Introduction: Focus on building rapport.

- Show a *compelling title* for the opportunity-switch masterclass: "How to ____ Without ____."
- *Build rapport* using the One Sentence Persuasion Formula:
  - Justify their failures: "It's not your fault low-carb diets did not work—they were never sustainable in the first place."
  - Allay their fears: "If you're worried you can't succeed, rest assured—you can with the right guidance."
  - Target the enemy: "Big corporations don't want you to win."
  - Confirm their suspicions: "You're right—the system was rigged against you."
  - Encourage their dreams: "You have a dream to make an impact, and this webinar will show you how."

Define the One Thing:

- Present the *Big Domino*, i.e. the new opportunity is the only way to achieve their greatest desires, e.g. "The only way to grow exponentially is through sales funnels, and the only way to build funnels is via ClickFunnels."
  - Tailor your message to the specific audiences, erring on the side of inclusivity. For example: "My goal for this presentation is to help 2 types of people. If you are [type 1] you'll get [desired result 1]. If you are [type 2] you'll get [desired result 2]."
- Share your *Epiphany Bridge backstory* on how you arrived at this realization. Recreate the emotional "aha" moment for the audience, linking back to where they're at now.
- Establish *credibility* by:

  (i) Briefly sharing your achievements (both external results and personal transformation); and

KEY QUOTES

"The goal is always to help them to see that this new opportunity will give them their greatest desires, increase their status, and help them achieve their goals."

"[Persuading people] doesn't begin at the close, that begins the second you start talking."

"While it may seem like we're doing a lot in this script, there is just one goal: Get them to believe One Thing."

"If you knock down these three beliefs through the content section of the presentation, the Big Domino will fall and they will join your new opportunity."

(ii) Sharing case studies to show the new opportunity works for other "ordinary" people, e.g. "Here's what [*real person*] achieved in just [*short timeframe*]."

Present the 3 secrets to replace false beliefs with new ones.

- Introduce each secret with a *curiosity-driven statement, followed by an Epiphany Bridge story* to dismantle the false belief:

  (i) Use this format: "You're probably thinking [*objection*], right? Well, let me tell you a quick story..."

  (ii) Conclude by stating the new belief as an undeniable truth, e.g. "Now you know how to ethically steal over $1,000,000 worth of funnel hacks for under $100..."

- Start with Secret #1 (vehicle belief), then repeat the process for Secret #2 (internal belief) and Secret #3 (external belief). You can use this approach to address as many associated beliefs as you wish, with a 30-60s story each. Once you *topple the false beliefs*, they will naturally embrace the Big Domino.

- *Recap the 3 secrets* and link them to the audience's desired results. For example: "If you use Secret #1 to find a funnel, Secret #2 to build it, and Secret #3 to drive traffic, do you think you could succeed?"

- Use questions to smoothly *transition to selling*:

  (i) "Who's excited about what we covered, but feeling just a bit overwhelmed?" Use light humor to ease the mood and explain that you can't cover everything in one session.

  (ii) Then ask: "Is it okay if I take 10 minutes to show you a special offer to help you implement this?" Pause to let them agree before you proceed.

The stack slide is where the selling happens. People only recall the last thing they see, so show each item in your stack slide one by one, building up the perceived value and ensuring they remember the full offer—not just the last item—to make your package look irresistible.

KEY QUOTES

"The old belief pattern has been shattered, and you've installed a new one. And that's the most powerful thing you can do as an educator and an expert."

"You're changing their world from I CAN'T to I CAN and I WILL. That's the biggest gift you can give people—hope and belief in themselves."

"This is not a teaching presentation; this is a presentation to inspire people and cause them to actually take action to change their lives. The teaching is what you do AFTER they have purchased."

"The act of buying creates a commitment that causes them to actually take action."

- Introduce the *core offer, leading in to stack slide 1*:

  (i) Briefly explain what they will get over 6 weeks of masterclass.

  (ii) Share 3 success stories and an inclusive statement, e.g. "This is for people who're already successful and want to multiply their results."

  (iii) Address their #1 objection, then show the 1st stack slide with the value of the main offer (e.g. Masterclass worth $6,997).

- Introduce the *1st tool or tangible asset, leading in to stack slide 2*:

  (i) Explain the pain/cost you experienced to create the tool/asset and how it'll help them to save time/money.

  (ii) Address the #1 objection about the tool/asset, then show the 2nd stack slide with the value of this tool (e.g. software worth $997) *in addition to* the main offer. Show the new total value.

- Repeat the same process for *other tools/assets* (e.g. templates, swipe files), progressively increasing the package's total value.

$$ Round up all the offers and their combined value in the **Big Stack Slide**. Make sure the value is at least 10x the actual price.

- Show the total value of the package then use the *if/all statement* to ask: "If all this system did was [*Secret #1 result*], would it be worth $[*total value*]?" Repeat for all 3 secrets to get them to say "yes" 3 times.

- Get them to think on the result's worth, e.g. "You can see why people invest $10,997 for such results." Then, reveal your price today (e.g. $997) at a *special discount*.

- Explain that *you had 2 choices*—to sell as many courses as possible cheaply, or to offer a quality program for a slightly higher price—and you chose to deliver the best results.

KEY QUOTES

"The only thing prospects remember when you sell is the last thing you showed them."

"Usually there's a common reason people don't get started right away. It's the elephant in the room. Address it head-on so they don't keep thinking about it through the rest of your presentation."

"If they don't think the last thing you offered is worth the price, they simply won't buy.

"The more you can get them to say yes, the more likely they will accept the epiphanies you've shared with them and the offer presented."

"As I gained experience, I realized that the elements that come AFTER the initial price reveal are vitally important to closing the sale."

- Explain that *they have 2 choices*—to do nothing (and get nothing), or take a leap of faith with this offer. Point out how fast they'll recoup the investment even with half the expected results.
- Remove all risks with a *30-day money-back guarantee*.
- Show the stack slide again to solidify the offer with *scarce, limited-time bonuses*.
- *Close* with a Q&A slide featuring: (i) a recap of the offer, (ii) a countdown timer, (iii) the final price and (iv) a CTA link or contact details.

Mastering Your Closes

Brunson categorizes closes into 2 types:

- *Trial closes* are used every 60s or so, to prime the audience to say "yes" repeatedly. Use questions like: Is this making sense? Can you imagine if this happened to you? Who here wants a free copy of this? Isn't this cool? Have you heard this before? Are you ready to get started?
- *Full closes* happen at the end of the presentation. Brunson shares his 16 favorite closing strategies, such as:
  - (i) Positioning money as a tool for exchange, not something to hoard.
  - (ii) Painting a vivid picture of their life now vs what it could be.
  - (iii) Reassuring them they have all they need to succeed.
  - (iv) Helping them visualize the specific steps they'll take.
  - (v) Eliminating perceived risks with guarantees.

You can use the Perfect Webinar flow to promote your offer via email, or to launch a new product:

- 1st email/video: Share your *Backstory* Epiphany.
- 2nd email/video: Share the *New Opportunity* Epiphany.
- 3rd email/video: Share the *Internal Belief* Epiphany.
- 4th email/video: Share the *External Belief* Epiphany.

KEY QUOTES

- 5th email/video: Share the *Stack*.

The Perfect Webinar script works for offers priced between $297-$2,997. However, high-ticket offers ($2,997-$100,000) require extra steps. Use personal calls to pre-screen and qualify prospects:

- Pre-quality prospects by having them fill out an *application form*.
- Approved applicants then book a *30-minute call*, during which you use 4 key questions to close the deal:

  (i) "Why do you want to achieve this goal? Why is it important to you?" Seek to understand their internal/external goals. Reject prospects with vague goals or those you can't help.

  (ii) "Why haven't you achieved this yet?" Aim to understand the obstacles, skills, or mindset gaps holding them back. Watch for red flags like blaming or lack of ownership.

  (iii) "What skills/assets/resources can you use to overcome these challenges that you're not utilizing 100%?" Keep asking "what else" to help them realize untapped solutions and possibilities.

  (iv) "Would you like me to help you achieve this?" If they say "yes", state your fee and deliverables. If affordability is an issue, offer a payment plan.

Build Your Funnel

Once your Perfect Webinar presentation is ready, the next step is to optimize and automate your process for attracting new leads and converting them into buyers.

Focus on 1 webinar, delivering it live weekly for a year to optimize it. Only automate your webinar *after* you have predictable results. Start a weekly rhythm, such as:

KEY QUOTES

"You want people who will take responsibility for their own actions."

"If you've done a good job with the questions, and they can afford your fee, then you should close most of the people you talk to."

- Mon–Wed: *Promote the webinar*.

  (i) Drive traffic to a *webinar page* with curiosity-driven headlines (e.g. "How to__ without __") and a registration deadline. Use static images as they convert better than videos.

  (ii) People who register are taken to a *thank-you page* with the webinar details and a video that conveys your passion. You can use this page to sell related products (e.g. free trials or memberships).

  (iii) Send emails to introduce your philosophy, build excitement for the webinar, and presell the 3 secrets. Explain each false belief and show how the webinar will prove it wrong. This boosts curiosity and ensures they show up.

  (iv) Send email/text reminders the day before, 1 hour before, 15 minutes before, and when the webinar is live.

- Thu: *Present live* for 90 minutes (60min content + 30min pitch) with 15-30 min Q&A. Choose a day/time that suits your audience. Keep refining your closing rate to increase revenue.

- Fri-Sun: Start your *post-sales* the day after the webinar. Share the replay, summary and/or cheat-sheets, along with reminders of the time-limited offers/bonuses. Close the cart on Sunday at midnight.

- *Repeat the cycle* weekly for a year to improve your targeting and results.

The key to driving traffic is find where your ideal audience already is. The Dream 100 strategy helps you to multiply your results.

- Identify *100 key people or companies* that control the traffic in your niche, such as influencers, bloggers, or podcasters.

- Start *nurturing relationships* with them by:

  (i) Subscribing to their email list, engaging on their social accounts, and learning about their interests.

  (ii) Providing a platform to promote their work and build rapport, e.g. interview them on your podcast/blog.

  (iii) Offering unique solutions to help them achieve their goals.

KEY QUOTES

"If your registration page isn't converting well, it's because you're showing people too much and they assume they know the answer."

"Buyers in motion tend to stay in motion...if they buy from you BEFORE the webinar, they are a lot more likely to buy from you ON the webinar."

"Run it every week for a full year, and watch what happens to your bank account and your expert status."

"If people think they have all the time in the world to buy, they won't."

"Dig your well before you're thirsty"
-Harvey Mackay

"There is nothing worse than getting a meeting with an influencer and not knowing who they are, what they're working on, or what's important to them."

- At the right time, *promote your offer to them*.

  (i) Ask them to share your offer with their audience;

  (ii) Target their audience through paid ads; and/or

  (iii) Partner with them by integrating your offer into their funnels, thank-you pages, or email campaigns.

Other Details in the Book to Look out For

You already have the potential to **make a massive impact** on people's lives. You just have to get clear on the audience you wish to serve, create a unique opportunity, get results with a beta group, craft the right offer, and master the art of storytelling.

This book provides a **step-by-step guide** to help you start your expert business, including numerous real-life examples, success stories, sample scripts and templates for sales presentations, emails, and webinars. For more details, visit https://expertsecrets.com.

About the Author

Russell Brunson is a serial entrepreneur, author, speaker, and digital marketing expert. He is the co-founder of ClickFunnels, a SaaS platform that helps businesses create highly effective sales funnels. Over the past 2 decades, Brunson has helped thousands of entrepreneurs scale their businesses and achieve financial freedom. He is the author of the bestselling Secrets Trilogy—DotCom Secrets, Expert Secrets, and Traffic Secrets—which provides actionable strategies for online success.

KEY QUOTES

"The WORST time to contact your Dream 100 is the day you need them to promote something for you. The best time to start building relationships is NOW."

"Your message has the ability to change people's lives, so use it."

SPIN SELLING

Situation ▪ Problem ▪ Implication ▪ Need-payoff

Neil Rackham

The Big "So What"

SPIN Selling is a research-backed sales framework for large, complex deals. It involves using specific questioning techniques to uncover customer needs, build trust, and close large sales effectively. The insights are especially useful for sales professionals, entrepreneurs, and business leaders involved in high-value, complex sales, or people looking to improve their ability to manage long sales cycles, engage multiple stakeholders, and drive long-term sales success.

What is SPIN Selling?

SPIN Selling is a consultative, needs-driven sales approach developed in the 1980s from the largest-ever research study on sales performance. The study analyzed 35,000+ sales calls involving 10,000+ salespeople across 20+ countries over 12 years.

- Neil Rackham and his team launched this extensive research after discovering that *traditional sales methods consistently failed in major sales*. By studying 116 sales variables and what set top-performing salespeople apart from the rest, they discovered that:

  (i) Common methods like aggressive closing and objection handling work in small sales but backfire in major sales.

  (ii) Instead, success in large sales is driven by a relationship-based, consultative approach facilitated by 4 types of questions: Situation, Problem, Implication, and Need-payoff (SPIN).

  - Situation: Gather background information;

KEY QUOTES

"I'm writing this book for people whose business is the major sale—and who, like me, have become dissatisfied with the effectiveness of traditional sales models and are looking for something more sophisticated."

"What works in small sales can hurt your success as the sales grow larger."

- Problem: Explore customer difficulties/needs;
- Implication: Understand consequences of the problems; and
- Need-payoff: Highlight the value of solving the problem.

- SPIN Selling was *field-tested globally*, showing a 20% average increase in sales volume. It works especially well in situations with long sales cycles, multiple decision-makers, and complex processes. The findings continue to influence sales methodologies today.

Understanding Buying Needs and Psychology

Small vs major sales: In SPIN Selling, small sales refer to low-value purchases that can be completed in a single call, e.g. buying a $15 USB drive. Major sales are high-value and complex, involving lengthy decisions and multiple decision-makers, e.g. buying a new home or a $150,000 enterprise IT system.

Major sales require a different approach due to differences in buyers' decision-making process and psychological factors.

- *Longer sales cycles*: Major sales span multiple calls involving multiple stakeholders. Discussions often occur in the absence of the salesperson, and the sales cycle can take months, or even years. A good product pitch is less important than building trust and helping customers to promote the solutions internally.
- *Higher stakes*: Not only are the investment amounts bigger, buyers also face scrutiny and accountability for their purchase decisions, making them more cautious.
- *Ongoing relationships*: Buyers often require long-term post-sale support, making the buyer-seller relationship critical.

Customer needs evolve in 3 stages, moving from implicit to explicit:

- *Vague dissatisfaction (Implied Need)*: Initially, the buyer notices minor imperfections but is unaware of their significance, e.g. "Our IT system is sometimes slow."

KEY QUOTES

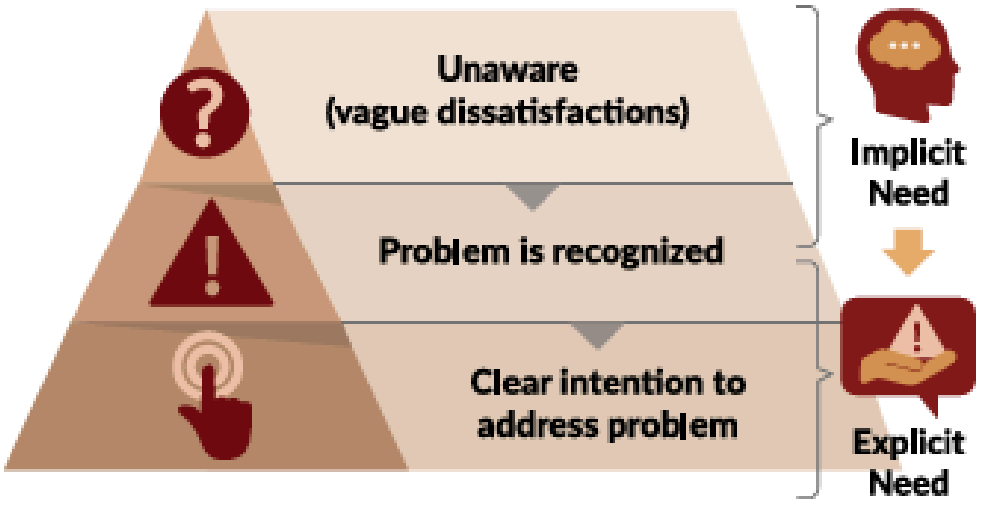
"Purchase price is one factor that increases caution, but fear of making a public mistake may be even more important."

"In a large sale, product and seller may become inseparable in the customer's mind."

- *Problem is recognized but not yet actionable (Implied Need)*: The buyer is aware of the challenges and feels dissatisfied with the situation, but has not decided to take action yet, e.g. "Each time the system crashes, orders are delayed."

- *Actionable wants (Explicit Need)*: The buyer expresses a clear intention to change the situation or address the problem, e.g. "We need a faster system to process orders on time."

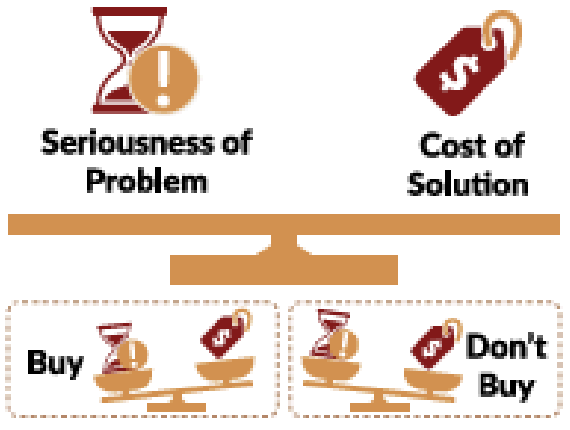
3 Stages of Needs Evolution



- In small sales, these stages can unfold almost instantly, and both implied and explicit needs can lead to a close. In major sales, the salesperson must guide this process to *transform implied needs into explicit ones* because (i) only explicit needs predict sales, and (ii) such needs can take months or even years to develop.

To make a purchase decision, buyers balance 2 opposing forces in the Value Equation:

The Value Equation



- *Cost of solution*: The higher the price, the greater the hesitation to buy.

- *Seriousness of problem*: The more urgent or painful the issue, the stronger the motivation to buy.

- Small sales can be impulsive, driven by relatively minor implied or explicit needs. However, in major sales, buyers need to perceive the problem as serious enough to *justify a significant investment*.

  - For example, a company facing occasional IT outages might hesitate to spend $150,000 on a new system. However, if they realize that the system crashes are leading to missed

KEY QUOTES

"The purpose of questions in the larger sale is to uncover Implied Needs and to develop them into Explicit Needs."

"The building of perceived value is probably the single most important selling skill in larger sales."

"In larger sales, Implied Needs don't predict success, but Explicit Needs do. In smaller sales, both Implied Needs and Explicit Needs are success predictors."

"The SPIN questions provide a road map for the seller, guiding the call through the steps of need development until Explicit Needs have been reached…And the more Explicit Needs you can obtain from buyers, the more likely the call is to succeed."

deadlines and customer losses worth $500,000 annually, a $150,000 system suddenly seems very compelling. The SPIN strategy uses structured questions to uncover Implied Needs and develop them into Explicit Needs.

In short, success in large sales call for a drastically different approach than small sales, due to several factors:

Aspect	Small Sales	Large Sales
Needs and Duration	Needs are identified and addressed quickly, often in 1 session.	Needs take time to surface and develop, often over multiple discussions or meetings.
Decision-Makers	One person makes the decision alone.	Multiple stakeholders must agree to the decision.
Emotions vs Logic	Decisions are often emotional or impulsive.	Decisions must be rationally justified.
Risks	Low risk or impact from a bad purchase.	High risk (e.g. loss of money and reputation) from a bad purchase.

SPIN Selling and the Sales Process

Almost every sales call—large or small—follows 4 distinct stages. However, the length and importance of each stage varies depending on the complexity and value of the sale.

- *Preliminaries*: These are the warm-up events at the start of a sales conversation. First impressions matter more for small sales and become less crucial in larger sales.

- *Investigating*: This is the most crucial stage for larger sales, and it's essential to ask effective questions to uncover facts, information, and needs, so as to tailor your solution to the customer's problems.

- *Demonstrating capability*: This is about showing how your solution can address the customer's needs and add value.

- *Obtaining commitment*. In smaller sales, this often means closing the deal. But for major sales, commitments are about advancing the sales process, which can include a follow-up meeting, a product trial, or access to a decision-maker.

KEY QUOTES

"In the early stages of an interaction with another person, we're usually so overloaded with information that we either don't notice, or we quickly forget, some quite obvious things."

Preliminaries: Opening the Call

These are the warm-up events at the start of a sales conversation. In major sales, the goal of an introduction is to set the right tone and prepare the buyer to answer questions in the Investigating phase.

Successful sellers focus on these core strategies:

- *Introduce yourself and your purpose* without going into product details. Establish: (i) who you are, (ii) why you're there, and (iii) why you should be asking questions.
- *Get to the point* with a direct, professional approach. Avoid lengthy introductions, excessive small talk or pleasantries. First impressions matter more for small sales than larger ones.
- *Don't talk about solutions too early*: If you open with benefit statements or product pitches before fully understanding the buyer's problems, it can trigger objections and derail the sales process.
- Focus on *preparing thoughtful, customer-centric questions*, rather than rehearsing the "perfect" opening.

Investigating Customer Needs with the SPIN Strategy

The goal of the Investigating stage is to uncover and clarify customer needs through structured questions.

- It is *the most critical stage in major sales* because it:

KEY QUOTES

"The common factor of most good openings is that they lead the customer to agree that you should ask questions."

"Early in the call you want to establish your role as the seeker of information and the buyer's role as the giver."

(i) Helps sellers understand real customer needs (rather than assuming them);

(ii) Makes buyers feel heard and understood; and

(iii) Sets the stage for tailored solutions that increase the chances of closing the sale.

Rackham's research showed that the top sellers used structured questions to move the discussion from Implied to Explicit Needs.

- Traditional sales methods focus on probing with *open and closed questions*. Open questions involve detailed responses ("Can you tell me about your current IT system?") while closed questions have a yes/no answer (e.g. "Do you manage your IT systems in house?"). However, the research found no link between the use of open/closed questions and sales success.

- The real difference comes from asking *purposeful, customer focused questions*—and that's where the SPIN strategy comes in.

SPIN questions—Situation, Problem, Implication, and Need-payoff—offer a structured approach to transform implied needs into explicit ones, increasing the likelihood of success in major sales.

- *Situation Questions* help to gather info on the customer's current situation, e.g. "How are your current processes managed?" or "Who is usually involved in decisions on new tech solutions?"

  - Top salespeople do their homework in advance to avoid excessive fact-finding that can bore or frustrate buyers.

- *Problem Questions* identify specific challenges, dissatisfactions, or pain-points, e.g. "Is this process causing delays or inefficiencies?" or "How often do you experience issues with data security?"

  - These are strongly linked to success in smaller sales. While they're less powerful in major sales, they invite buyers to share Implied Needs, and help to probe for problem areas that your product/service can address.

KEY QUOTES

"There's no doubt about it, questions persuade more powerfully than any other form of verbal behavior."

"The more you ask questions, the more successful the interaction is likely to be. And some types of questions are more powerful than others."

"If you can't uncover any problems to solve, you don't have a basis for a business relationship."

"Problem Questions...provide the raw material on which the rest of the sale will be built."

- *Implication Questions* highlight the consequences of the problems, e.g. "How do delays affect your delivery times and customer satisfaction?"
  - They help buyers to see the broader impact of their problems, increase the perceived value of your solution, and build urgency to solve the issue.

- *Need-payoff Questions* focus on the positive outcomes of solving the problem, encouraging the customer to articulate the value and benefits of your solutions, e.g. "Would faster processing times help you retain more customers?"
  - Use prompts like "Why is that important?" or "Would it be useful if...?" Such questions help buyers to "sell" the solution to themselves, thereby reducing objections and reinforcing the perceived value of the solution.
  - Buyers might also highlight nuances or complexities that you might not be aware of. This process also helps them to rehearse the points to explain/sell your solution more effectively to other internal stakeholders.
  - Unlike Implication Questions (which build up the seriousness of the problem), Needs-payoff Questions focus on solutions to make the conversation more positive and constructive. However, (i) don't ask the questions too early in the call before you've fully explored the customer's problems and their impact, and (ii) make sure you only ask Need-payoff Questions where you can offer a solution.

Although the SPIN Model is often used sequentially, it is *not* a rigid formula. The key is to be flexible, adjusting your approach and sequence as required to help the buyer move from Implied to Explicit Needs.

Prevent objections, instead of merely handling them:

- Traditional sales training focuses on using rebuttal techniques for *objection handling*. However, these only address the symptoms of objections, not the causes. Research shows that frequent objections actually *reduce* sales success.
- Customers raise objections when their needs are insufficiently addressed, or when solutions are offered before the buyer fully recognizes the problem's seriousness. You can *prevent objections* by addressing these root causes:

KEY QUOTES

"Implications are the language of decision makers, and if you can talk their language, you'll influence them better."

"Customers react more positively if they are treated as the experts...get the customer to explain to you which elements of the problem your solution can solve."

"Success in large sales depends on internal selling by customers on your behalf, and Need-payoff Questions are one of the best ways to rehearse the customer in presenting your solutions convincingly to others."

"If you can get the customer to tell you the ways in which your solution will help, then you don't invite objections."

"Make no mistake about it, the more objections you get in a call, the less likely you are to be successful."

"Objection prevention turns out to be a superior strategy to objection handling."

(i) Don't offer solutions too early, before you've used the SPIN questions to build strong needs explicitly. Use Implication Questions to build up the perceived seriousness and urgency of the problem, and use Need-Payoff Questions to increase the perceived Benefits and value of a solution.

(ii) However, address any genuine concerns that your product/service might not meet the buyer's needs.

Demonstrating Capabilities by Showing Benefits

The goal of this stage is to show how your solution specifically addresses the buyer's Explicit Needs and delivers measurable value.

- Do *not* start on this stage until you've finished the Investigating stage to uncover and develop needs, and the buyer genuinely wants a solution.

Differentiate between features, advantages and benefits.

- *Features* are facts about a product, e.g. "1TB of storage". Generally, they have no real impact on sales (big or small) unless they are linked to specific customer needs. In fact, presenting too many features often leads to price concerns.

- It's generally more effective to explain how the features can help the buyer. In this regard, SPIN Selling differs from traditional selling by further splitting this into 2 categories: *Advantages vs Benefits*.

  - *Advantages* describe how the product/service could help the buyer in general terms (e.g. "With 1TB storage, you'll never run out of data space."). However, they are based on Implied Needs, and might not be relevant to the customer.

  - *Benefits* describe how the product/service specifically addresses Explicit Needs expressed by the customer.

In major sales, the key to success is to present specific benefits linked to the buyer's Explicit Needs. This was found to increase major sales success by 27%.

- Wherever possible, *provide measurable outcomes* to reinforce the value of your solution, e.g. "reduce downtime by 25%."

KEY QUOTES

"Curing a selling problem, just like curing a disease, rests on finding and treating the cause rather than the symptoms."

"Features are low-power statements that do little to help you sell. It's better to use Benefits than Features."

"Advantages are less powerful than Benefits all through the selling cycle. It never pays to offer an Advantage if you can go that bit further and offer a Benefit."

"Do a good job of developing Explicit Needs and the Benefits almost look after themselves."

- Avoid discussing *features or vague advantages* that aren't directly linked to buyers' expressed needs—these are useful in small sales, but are ineffective for major sales.

To demonstrate capability effectively in major sales, build Explicit Needs before offering solutions with 3 key strategies:

- *Don't offer solutions too early in the conversation*. For small sales, it's ok to present solutions right after spotting a problem. For large sales, use Implication and Need-payoff Questions to develop Explicit Needs first, as it will make your solution more relevant and compelling.

- *Don't confuse Advantages with Benefits*. Avoid general claims that sound helpful but don't relate to the buyer's unique challenges. Only highlight what's relevant to their Explicit Needs.

- When *launching new products*, don't overload buyers with Features and Advantages. Focus on the customers' problems, and plan your SPIN questions before pitching your product.

KEY QUOTES

"If you can get your customers to say, 'I want it,' it's not difficult to make a Benefit by replying, "We can give it to you."

"Closing techniques, like all forms of pressure, become less effective as decision size increases."

Obtaining Commitment: Securing Next Steps

The goal of this stage is to secure a specific, actionable commitment that moves the sales process forward.

- Traditional closing techniques—such as assumptive closes, alternative closes, or last-chance closes—can be effective in smaller sales where the goal is to speed up the transaction. In major sales, *avoid pushy closing methods* as they erode trust and reduce the likelihood of a final sale.

- Success in large sales comes from understanding the buyers' decision-making processes, and *guiding them step by step* toward a meaningful agreement, based on their level of readiness.

- In small sales, the goal is often to close sale in a single call. But in major sales, there are *4 possible outcomes*:

  (i) Order: The customer commits to a purchase. For large deals, this rarely happens in the first meeting(s).

"Most people are less satisfied with decisions that they feel they've been pressured to make than with those which they believe they've made entirely of their own free will."

(ii) Advance: The customer takes a significant step forward, such as agreeing to a product trial, meeting a decision-maker, or scheduling a follow-up call.

(iii) Continuation: The customer expresses interest but takes no concrete action, e.g. saying "We'll consider this and get back to you" without specific steps or deadlines. There's no real progress and the sales call has failed.

(iv) No-Sale: The customer decides not to proceed, i.e. there will be no chance of doing business with them.

- *Advances are the most critical outcomes* in major sales, and your goal is to secure a meaningful commitment based on the buyer's readiness to proceed.

Focus on understanding the buyers' decision-making processes, and guiding them step by step toward a meaningful agreement using 4 specific actions:

- Spend more time using SPIN questions to *investigate needs customers' and demonstrate capability*, rather than trying to close the sale. Once buyers recognize their own needs and the value of your solution, they often close the sale themselves.

- *Summarize the key Benefits* in relation to the buyer's expressed needs. Link your solution directly to the problems and consequences uncovered during the sales call, e.g. "So far, we've seen how automating this process can reduce downtime by 40% and improve delivery speed by 30%."

- *Check explicitly for unresolved concerns* by asking questions like, "Are there any points you'd like me to clarify before we move forward?" Don't push for a commitment until you know the buyer is confident your product can solve their problems.

- *Propose the next step*: Instead of asking "Do you have any other questions?" suggest a clear action to guide the buyer forward, e.g. "The next step would be to schedule a product demo with your IT team." Choose the highest level of commitment based on the buyer's readiness.

KEY QUOTES

"Whether a call has been successfully closed should be judged by customers' actions, not by their words."

"Successful sellers never push the customer beyond achievable limits."

"If you can convince buyers that they need what you are offering, then they will often close the sale for you."

"I've never been a believer in closing, because my objective is not to close the sale but to open a relationship."
—Hans Stennek, Consultant

Applying SPIN Selling Approach

The only way to translate the theories and insights into results is to apply them in real-life, using consistent practice and continuous learning to master the skills and techniques.

Master the SPIN questions in sequence, progressing from simpler steps to tougher ones:

- Start by *asking any type of question* for a few weeks, until you feel as comfortable asking questions as making statements.
- Next, *master Problem Questions* by asking at least 6 questions per call to uncover problems and pain-points.
- Then, move on to *Implication Questions*. Using past customer cases, imagine your customer saying "So what?" then craft questions to draw out serious consequences.
- Once you're comfortable with the other 3 types of questions, move to *Need-payoff Questions*: Instead of pitching benefits to your customers, ask questions like: How would this help you? What do you see as the pluses of this approach? Is there any other way our product could be useful?

Use these 4 golden rules to develop skills in each area:

- *Practice just 1 behavior at a time*. For example, practice asking Problem Questions until you're comfortable, then move on the next action.
- *Practice in safe situations*, such as internal role-plays or with low risk customers, until you're confident of the skill. Do not practice in high-stakes sales meetings or situations.
- All new behaviors feel awkward initially. *Practice a new behavior at least 3x* before deciding if it works for you.
- *Focus on quantity before quality*: Don't worry about perfection initially. Go for quantity first—with enough practice and repetitions, quality will improve naturally.

Improve continuously with the Plan-Do-Review cycle:

KEY QUOTES

"There's no easy way to convert theoretical models into practical skills...No book on selling will, of itself, improve your selling skills, any more than reading a book about swimming will teach you how to swim."

"The first time you try anything new, it's bound to feel uncomfortable. It's not only new shoes that hurt at first."

"Use the new behavior often enough and the quality will look after itself."

- *Plan ahead*: Before a sales call, think through customer problems and their potential consequences, and craft powerful questions in advance. Specifically:

  (i) Identify at least 3 customer problems your product can solve, framing them as *Problem Questions*, e.g. "Is system downtime causing delays in customer service?"

  (ii) Prepare *Implication Questions* by zooming in on key problems the customer might face. Think about the related difficulties each problem could cause, then craft questions to emphasize the problem's seriousness, e.g. "What would happen if your team couldn't process transactions during peak hours?"

  (iii) Practice *Need-Payoff Questions* with friends, colleagues, or family members. Use relatable topics (e.g. buying a car or planning a trip) and aim to get them excited about potential benefits using those questions.

- After each sales call, *review* if you've achieved your goals, what you learned, and how you can apply the insights in the future. Zoom in on the specifics; don't settle for generic reflections like "It went well."

Other Details in the Book to Look out For

This book is packed with information about the extensive research done by the Huthwaite team, with real-world sales data and examples of traditional sales methods vs the SPIN Selling approach. It also includes appendices with details on the SPIN Model research and a Closing-Attitude Scale. For more details and resources, please visit huthwaiteinternational.com.

About the Author

Neil Rackham is a British psychologist, author, and consultant, best known for his pioneering research in sales and marketing. Rackham earned a bachelor's degree in

KEY QUOTES

"We've put thousands of sales calls under the microscope to isolate some of the detailed behavioral elements that bring success in the major sale. Use the results of our research to examine, develop, and improve the minute particulars of your selling skills."

psychology from the University of Sheffield in 1966 and continued as a postgraduate research fellow, focusing on interpersonal skills in negotiation and selling. In the 1970s, he led one of the largest research studies on sales effectiveness, leading to the SPIN Selling methodology that revolutionized consultative selling practices.

KEY QUOTES

- *Strengthening cybersecurity and risk management* by investing in advanced cybersecurity technologies, training employees on data security best practices, and collaborating with industry experts to stay ahead of evolving threats.

- *Ethical decision-making and governance*: Establish ethical frameworks that guide AI and data-related decisions at all levels, such as ethical review boards to oversee AI projects, organization's strategic goals.

Navigating Leadership Challenges

Despite the massive potential of AI, most leaders and managers today are still using frameworks suited to a pre-AI world. Many of them lack the knowledge and flexibility for AI-driven business models, leading to a **gap between business potential and managerial approaches**.

Leaders of AI-powered firms must focus on **4 key pillars**, each requiring distinct skills and strategies:

- Leaders must guide their organizations through *continuous transformation* in face of rapid changes. This goes beyond digital upgrades to include a rethinking of business models, operations, and strategies. Leaders must create agile teams, flexible structures, overcome resistance to change, build technical expertise, and transform the organizational culture.

- *An entrepreneurial mindset* is essential for all types of companies today, not just startups. Leaders must foster a culture of innovation and agility, where people embrace ambiguity, experimentation, risk-taking, and data-driven decision-making.

- Leaders must also understand and influence the evolving *regulatory landscape* around AI and data. This includes navigating complex AI-related laws and policies, and balancing the need for innovation and compliance.

- Leaders are also responsible for building a strong, trusting relationship with customers, stakeholders, and the broader *community*. They must ensure that AI technologies not only address business goals, but also benefit society as a whole.

KEY QUOTES

"Most platform companies [seek] to shape and control its ecosystem and make sure that its tools and technologies do not cause harm. But how to properly exercise such control is not at all obvious."

"In contrast with the current wealth of data, analytics, and AI, we still appear to be suffering from a shortage of managerial wisdom."

"Managers will have their work cut out for them, as they reflect on their evolving role in our increasingly digital economy."

"Transformation…starts at the top, with motivating and grooming a generation of leaders to do the hard work involved."

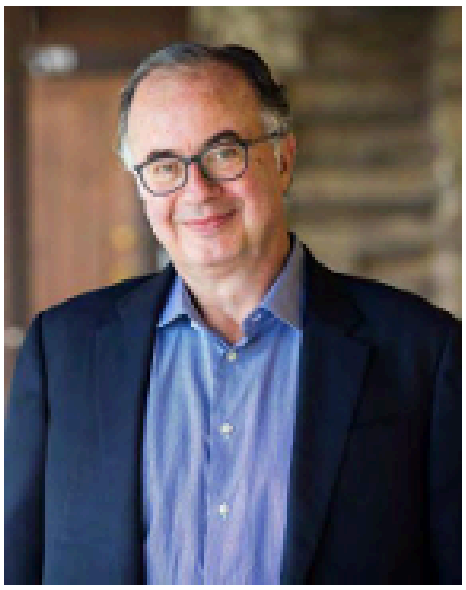
"Transformation does not apply only to traditional firms…every hub company must transform to survive and must do so repeatedly."

In this era, no single leader or individual can navigate the complexities of AI and digital transformation alone. Instead, we need **collective intelligence**—to leverage insights from teams, communities, and AI itself. This in turn requires: a learning and collaborative culture, diversity and inclusion, transparent decision-making, and balancing AI's analytical capabilities with human creativity and intuition.

Other Details in the Book to Look out For

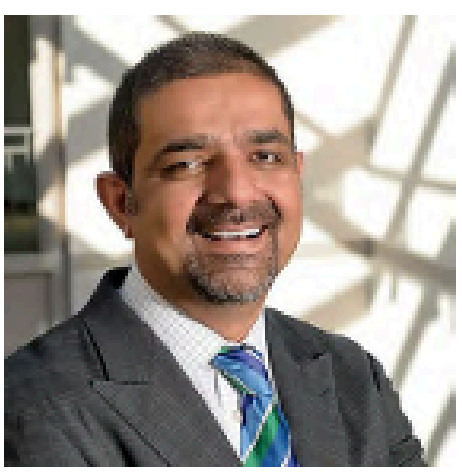
AI is here and it's already transforming every aspect of the business landscape. To thrive, we must learn to ride the wave of innovation. This book includes detailed case studies ranging from fitness to grocery delivery and finance, with critical insights and frameworks on how to adapt and thrive in the age of AI. For more details, please visit www.ageof.ai.

About the Authors



Marco Iansiti is a professor at Harvard Business School, specializing in the impact of artificial intelligence and digital transformation on business strategy and operations. He has numerous books and articles on innovation, technology, and strategy, and his research has shaped how leaders think about data-driven decision-making and the role of digital platforms in creating competitive advantage.

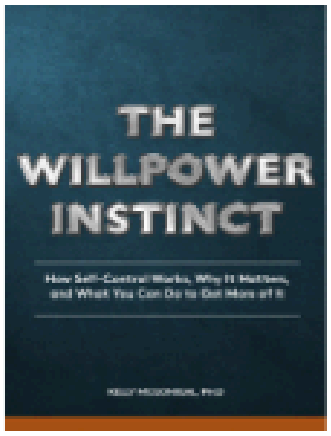
Karim R. Lakhani is a professor at Harvard Business School, where he leads research on AI, digital innovation, and crowdsourcing. He is well-known for his expertise in technology-driven entrepreneurship and the development of AI-based strategies for companies across industries.



KEY QUOTES

"We must find wiser ways to lead the increasingly digital firm...we must find better ways to manage the new assets and capabilities that are being created and deployed, every day, across every organization."

"There is no longer a rationale for staying behind, doubling down on old strengths and capabilities, and ignoring the emergence of a new operating model that is overwhelming every major sector of the economy... No organization should be standing still."



THE WILLPOWER INSTINCT

How Self-Control Works, Why It Matters,
and What You Can Do to Get More of It

KELLY MCGONIGAL, PH.D

The Big "So What"

All of us missed goals at some point because we gave in to distractions or temptations, or failed to do what we should. Willpower failures are *not* a sign of personal weakness, but the result of several physical, mental-emotional and social factors. This book explains willpower using insights from economics, psychology, neuroscience, and medicine, with a range of tips and strategies to help you overcome distraction, temptation and procrastination.

Introduction

Willpower is the ability to exercise self-control when you need it. To improve your self-control, you must understand why you lose control and what you can do about it. This book is based on the popular course "The Science of Willpower" by Stanford University psychologist and educator Kelly McGonigal. The book mirrors her 10-week course, with each chapter covering (i) a key scientific insight and (ii) practical exercises/strategies to help you develop self-awareness and address real-life challenges.

McGonigal recommends that you approach the ideas like a scientist.

> **Willpower Exercise:** Choose a *willpower challenge* you've been trying to overcome. Then, try out each of the strategies below. Collect data and figure out what works (or doesn't work) for you.

KEY QUOTES

"Most people feel like willpower failures—in control one moment but overwhelmed and out of control the next."

"Self-knowledge—especially of how we find ourselves in willpower trouble—is the foundation of self-control."

"You can—and should—make yourself the subject of your own real-world study."

Understand and Improve your Self-Control

What Is Willpower and Why It Matters

Willpower is much more than the ability to say "no" to temptation. It comprises 3 powers to help you become better:

- "*I will*" power: Doing things that improve your quality of life;
- "*I won't*" power: Not doing things that impairs your happiness, well-being or success; and
- "*I want*" power: Focusing on your most important long-term goal.

In short, self-control is about finding your motivation at the right time. It's about remembering what you truly want so you can do what you should and resist what you shouldn't.

Willpower matters. All of us have the capacity for self-control, but how far you use it determines your physical health, financial stability, academic and professional success, quality of relationships, and levels of stress and happiness.

Willpower Is Affected By Your Brain

We struggle with self-control because we literally have multiple minds, each with conflicting thoughts, feelings, and goals.

- The *prefrontal cortex* in our brain controls logical thinking and what we focus on. It has 3 different regions:

  (i) The *left side* helps you to start and persist in tasks ("I will").

  (ii) The *right side* helps you to resist acting on every impulse ("I won't").

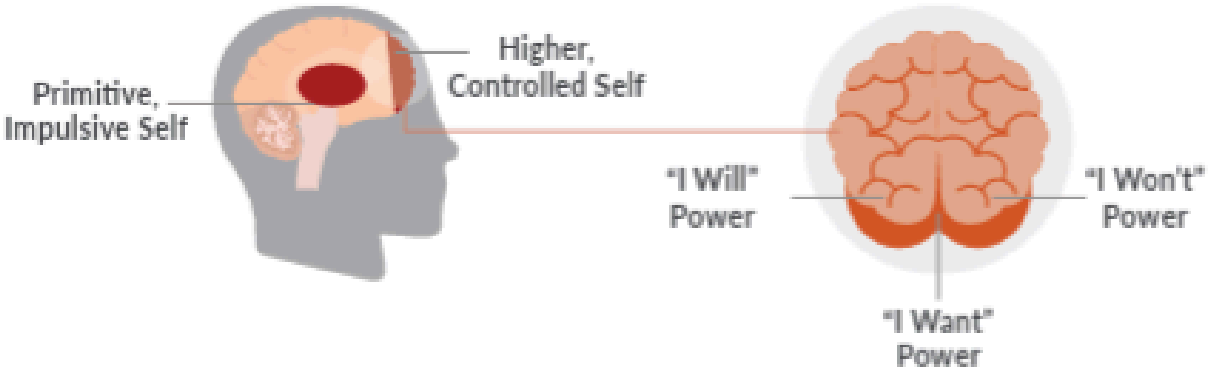
  (iii) The *lower-middle area* helps you to track your goals and desires ("I want"). When these cells are firing rapidly, you're more motivated to take action or resist temptation.

KEY QUOTES

"Willpower is actually three powers…that help us to be a better version of ourselves."

"People who have better control of their attention, emotions, and actions are better off almost any way you look at it."

"When it comes to self-control, we've seen that the human mind is not one unified self, but multiple selves who compete for control."



- The prefrontal cortex is built on top of the more *primal part* of our brain that acts on urges and instincts. These impulses evolved to help us survive, e.g. we prefer sweet and fatty foods because they give us energy, and our feelings (e.g. fear or disgust) stop us from doing things to hurt or isolate ourselves.

- In short, part of our brain seeks to feel good *now*, while another part manages the impulses so we can achieve *long-term goals*. The 2 minds are in a *constant battle*. We want a slim body but we also want to enjoy a cookie. We want to excel in our exams and but we also want to watch TV.

- When we're *drunk, exhausted or distracted*, the prefrontal cortex loses part of its capabilities, making it harder for us to exert self-control. Students trying to remember a telephone number are 50% more likely to choose chocolate cake over fruit, and distracted shoppers are more likely to buy promotional items that aren't on their shopping lists.

Willpower Exercise: Consider what makes your willpower challenge difficult. What do you feel when you think about it?

To strengthen your willpower, you need to develop self-awareness. Understand your impulses and recognize when you must exercise self-control, so you can activate your prefrontal cortex to make conscious choices instead of defaulting to the easiest option.

Willpower Exercises:

- What do your *2 selves* (impulsive vs wise selves) want to do?
- *Track your choices*. At least once per day, consider the choices you've made. Which choices support or undermine your goal? What was happening when you made those choices (e.g. were you distracted or tired)?

KEY QUOTES

"While we all have the capacity to do the harder thing, we also have the desire to do exactly the opposite."

"While we're stuck with the impulse, we're also equipped with the impulse control."

The more you exercise your prefrontal cortex, the bigger, faster and stronger it gets (just like how physical muscles are built). Meditation increases blood flow to the prefrontal cortex to improve your focus and self-control.

Willpower Exercise: Do *5 mins of brain-training meditation* daily. Sit still and focus on your breath. Think "inhale" and "exhale" as you breathe. Notice when your mind wanders, and just refocus on your breathing. Don't fidget! You're training yourself not to act on every impulse, to activate your prefrontal cortex and quieten the stress/craving centers.

Willpower Is Affected By Your Body

Scientists have found that self-control is more about physiology than psychology. This means that you can train yourself to get into an ideal physiological state for self-control.

- When you're facing a real external threat (e.g. a robber in an alley), the primal brain triggers the *fight-or-flight response*. Your prefrontal cortex is inhibited so you can act without overthinking, your body releases hormones to unlock energy and your heart pumps harder to send blood and oxygen throughout the body to help you survive.

- When you're facing a temptation (e.g. a delicious cheesecake), your body also reacts physically. Your attention is focused on the cake, your heart rate increases and your blood sugar level falls as your body anticipates the sugar rush. However, once you realize that you're dealing with an *internal conflict* (not a real threat), you can calm the brain/body and dampen the impulses.

Willpower Exercise: *Name the impulse* that you must control to succeed in your willpower challenge (e.g. the "cookie monster" that can't resist cookies, or "the critic" who keeps complaining).

Psychologist Suzanne Segerstrom found that self-control comes with an opposite physiological state from stress. She calls this the pause-and-plan response.

KEY QUOTES

"Willpower is a biological instinct, like stress, that evolved to help us protect ourselves from ourselves."

"The perception of an internal conflict triggers changes in the brain and body that help you slow down and control your impulses."

"Like the fight-or-flight response, the pause-and-plan response begins in the brain."

- Pause-and-plan is about *slowing down* so your prefrontal cortex can step in to calm your breathing/heart rate, relax your muscles, and redirect energy to the brain. This allows you to think clearly and calmly, refocus on your long-term goals and explore options instead of acting on impulse.

- Your *heart rate variability* is one of the best indicators of how stressed or calm you are.

  (i) Under normal circumstances, your heart rate varies naturally, e.g. it increases slightly when you inhale and decreases when you exhale. When you're stressed, your heart rate goes up and stays up (i.e. variability decreases).

  (ii) People with higher heart rate variability are more likely to delay gratification, resist distractions, persevere in face of difficulty or failure, and cope with stressful situations.

- To exert self-control, first *calm your body*, decrease your heart rate and increase its variability.

Willpower Exercise: Before facing a willpower challenge, *slow down your breathing* to just 4-5 breaths per minute (or 10-15s per breath). Do this for 1-2 minutes to activate your prefrontal cortex, increase your heart rate variability and put yourself in a physiological state of self-control.

Basically, anything that reduces stress also improves your willpower reserve. This includes exercise, adequate sleep, a sound diet, quality time with family/friends, and spiritual practices.

Willpower Exercise: Observe what happens when you're stressed. Are you more likely to lose self-control or procrastinate?

- There's now extensive research to show that *exercise* helps to increase focus and self-control in all aspects of life. Participants in a study had less cravings after just 15 min on the treadmill. In the long-term, exercise also increases baseline heart rate variability and the growth of gray/white matter in the brain to make your brain bigger and faster.

KEY QUOTES

"Stress is the enemy of willpower."

"Exercise turns out to be the closest thing to a wonder drug that self-control scientists have discovered."

Willpower Exercise: Do *5min of green exercise*, i.e. physical activity done outdoors in nature. Or, opt for any non-sedentary activity that you enjoy, e.g. walking, gardening, dancing.

- *Sleep deprivation* makes your more vulnerable to stress and temptations. When you're tired, your cells can't absorb glucose as effectively and become under-fueled. A lack of sleep (<6 hours a night) impairs your prefrontal cortex to reduce focus and self-control. Prolonged lack of sleep also increases your stress hormones and decreases heart rate variability.

Willpower Exercise: Aim for *8hrs of uninterrupted sleep* every night, or minimally take a short nap daily.

- *Choose your willpower challenges carefully*. Don't try to control everything, or you'll run out of energy/focus and feel chronically stressed.

Willpower Exercise: Restore your willpower reserve by taking a few minutes to *relax*. Lie down and breathe deeply for 5-10 min to give your brain/body a complete break.

Willpower Works Like Muscles

Our willpower follows the same use-it-or-lose-it rule as physical muscles. It becomes weak with neglect, can get exhausted from non-stop use, but can also be strengthened with proper training. Learn to pace yourself: alternate between pushing your limits and recovery.

Once you exhaust your **limited willpower reserves**, you become more susceptible to temptations and bad decisions. Smokers who don't smoke for 24 hours are more likely to binge on ice cream, and people who diet are more likely to cheat on their spouses.

- Our self-control is the highest in the morning and gradually *depletes throughout the day* with every conscious choice and activity we undertake. Aim to:

KEY QUOTES

"To preserve both your health and happiness…you will have to choose your willpower battles wisely."

"Self-control is like a muscle. It gets tired from use, but regular exercise makes it stronger."

"We cannot control everything, and yet the only way to increase our self-control is to stretch our limits."

(i) Start the day with the hardest or most important challenge;

(ii) Periodically replenish your willpower reserves; and

(iii) Build your overall willpower capacity.

Willpower Exercise: Observe how your willpower levels fluctuate throughout the day and week. Plan your schedule to avoid temptations when your self-control is at its weakest.

- Self-control requires *energy*. Participants in a study were given a series of self-control tasks. Those who received a sugared drink to restore blood sugar showed improved self-control compared to those who received a drink with artificial sweeteners. The absolute blood sugar level isn't as vital as the direction of change—when the brain detects a drop in blood sugar, it starts to conserve energy, leaving less mental resources for self-control.

Willpower Exercise: Maintain your blood sugar level with a low-glycemic diet (e.g. lean proteins, nuts/beans, high-fiber grains/cereals, fruits and vegetables).

During endurance sports, you start to feel tired before your body is truly fatigued. Athletes routinely push past this initial fatigue to perform closer to their real physical limits. Likewise, our brain starts to conserve mental energy *before* our willpower reserves are truly depleted. You can transcend your initial mental exhaustion with the right motivation:

- Students who were too tired to finish their tasks suddenly had the will to do so when they were given *new incentives*.
- A young woman couldn't stop shouting at her kids even though she tried to be a good mother. Once she realized that her *true motivation* was to enjoy parenthood (not to be a model mum), she was able to change how she engaged her kids.

Willpower Exercise: Find your biggest want and use it as a source of motivation whenever you need a willpower boost.

Build your self-control muscles like how athletes build muscles:

KEY QUOTES

"If we want to strengthen self-control, we may need to think about how we can best support the most exhausted version of ourselves—and not count on an ideal version of ourselves to show up and save the day."

"Fatigue should no longer be considered a physical event but rather a sensation or emotion."
—Timothy Noakes

"Sometimes our strongest motivation is not what we think it is, or think it should be."

"When there's a want, there's a will."

- *Control 1 small thing* that you don't normally control.

Willpower Exercise: *Flex your self-control muscle*:

- I Won't: Stop doing something you usually do, e.g. refrain from swearing or using your dominant hand.
- I Will: Do something daily that you don't normally do, e.g. helping someone, meditating for 5 minutes.
- Self-Monitoring: Track something you don't usually pay attention to, e.g. daily expenses, time usage.

- Routinely *push your limits*:

Willpower Exercise: The next time you feel too tired for self-control, just push yourself 1 step beyond the point of fatigue.

Moral Licensing Can Cause Self-Sabotage

We tend to moralize willpower, i.e. we think we're "good" if we succeed at a willpower challenge and "bad" if we fail. This triggers mental traps which increase the risks of self-sabotage.

When we think we're "good", we trust our impulses (including the bad ones) or tell ourselves that we deserve a treat. So, the more we do something "good" or moral, the more we may to do something "bad" or immoral later. Psychologists call this moral licensing.

- Thinking of *past or potential virtues* can lead to less virtuous behavior. When people were asked to recall a time they acted generously, they gave 60% less to a charitable request compared to a control group. Even when people were asked to consider donating money to charity (without actually donating it), they became more likely to treat themselves later.

Willpower Exercise: Do you associate your willpower struggles with morality? Do you indulge after being "good" and does it jeopardize your goal?

KEY QUOTES

"We can...push past the feeling of willpower exhaustion to make it to the finish line of our own willpower challenges."

"Whenever we have conflicting desires, being good gives us permission to be a little bit bad."

- Moral licensing increases when people pay a *penance* for bad behavior which erases their guilt. For example, people who pay to plant a tree may feel justified to use even more electricity. It's better to get people to engage in good behaviors that replace the bad ones (e.g. paying 10% more for green energy), since it *reinforces their identity* (e.g. "I'm someone who cares about the environment") to increase their commitment.

Willpower Exercise: Do you identify more with your long-term goals or with your short-term impulses?

- *Stop moralizing willpower struggles*. Robbing a bank or physically hurting someone may be a moral breach, but missing a session at the gym isn't.

We may feel so good about **making progress** that we reward ourselves with an indulgence that jeopardizes our goal.

- The solution is to *focus on your goal*, not the progress you've made. When students were asked to recall how they rejected a temptation in the past, they indulged themselves at the next available opportunity. However, the moral licensing effect was negated when they recalled the incident and *why* they'd resisted the temptation. By remembering your "why", you'll realize that the indulgence is not a reward but a threat to your goal.

Willpower Exercise: The next time you use progress to justify indulgence, stop and remember your "why".

The halo effect kicks in when the good feelings from 1 thing affects how we see other things. It may create the illusion that a "good" choice will cancel out a "bad" one. People who eat a salad and a burger think they're consuming fewer calories than those who're eating just a burger. Bargain-hunters may feel so good about saving money that they buy more than intended.

Willpower Exercises:

- Watch for halo effects, e.g. when you justify a vice due to a virtuous trait like "buy 1 get 1 free" or "organic".
- Use a concrete counter-measure (e.g. calories consumed, total cost, time spent) to weigh the net impact.

KEY QUOTES

"Moralizing a behavior makes us more, not less, likely to feel ambivalent about it."

"For better self-control, forget virtue, and focus on goals and values."

"When we want permission to indulge, we'll take any hint of virtue as a justification to give in."

We're overly optimistic about our ability to do the right thing in the future, e.g. we overeat now on the promise that we'll exercise later.

- Counter this by assuming that *tomorrow will be just like today* (not better). Instead of asking "Should I have this ice-cream now?" ask "Do I want to face the consequences of eating an ice-cream every day?"

Willpower Exercises:

- Do you promise to take action tomorrow to make up for today's indulgence? Do you actually follow through?
- Assume that tomorrow will be like today, and your current choice will reflect *all* future choices.

We Confuse Desire with Happiness

When our brain recognizes an opportunity for reward it releases dopamine, a neurotransmitter that focuses our attention on the potential source of reward. It concurrently releases stress hormones so we feel stressed about not having that item yet.

- A *dopamine rush* fills us with anticipation of a reward. We don't feel happy or satisfied because it doesn't actually deliver on the promise. Yet we're afraid to stop in case we lose out.

  (i) When lab rats were given access to levers that triggered brain stimulation, they ignored food and burned their feet just to keep pressing the levers. Human patients who were given a control box to stimulate their brains got so addicted that they refused to stop and eat even when they were hungry.

  (ii) We keep playing video games to get to the next victory/ level. Gamblers keep betting in hopes of the next big win. Surrounded by temptations, we can feel constantly-wanting yet never-satisfied.

- Dopamine makes you *susceptible to all sorts of temptation*.

  (i) Parkinson's disease is often treated with drugs that flood the patients' system with dopamine. This eases the

KEY QUOTES

"We wrongly but persistently expect to make different decisions tomorrow than we do today."

"Dopamine is for action, not happiness...[it brings] anticipation, not pleasure."

"Our brains mistake the promise of reward for a guarantee of happiness, so we chase satisfaction from things that do not deliver."

symptoms but creates side effects e.g. binge-eating, gambling, alcoholism or excessive sexual urges.

(ii) Shoppers who're given free samples of something sweet are more likely to buy indulgent foods or sale items, and scent marketers use smells to trigger dopamine release. Sexy models are used to promote all sorts of items.

Willpower Exercises:

- Observe your inner dopamine triggers, and how retailers and marketers lure you with the promise of reward.
- When you give in to temptation, do you feel happier or more anxious?

It's impossible to restrict/ban dopamine stimulants. However, you can reduce their impact just by being aware of their true nature.

- Learn to differentiate between *real vs false rewards*. Real rewards give you meaning and satisfaction, while false rewards leave you feeling anxious, disappointed, or unsatisfied.

Willpower Exercise: When you next indulge in an insatiable desire (e.g. shopping, snacking), do it mindfully. Does the experience match your expectations? You'll probably find that you feel unsatisfied, or need much less than expected to feel satisfied.

Use dopamine to make difficult/unpleasant tasks more appealing. When patients undergoing a 12-week therapy could participate in a small weekly lucky draw, 85% completed the therapy (compared to 20% without the lucky draw). A woman found motivation to clean up her room by using holiday music and candles to create a festive mood.

Willpower Exercise: "Dopaminize" your willpower challenge by linking it to a reward you look forward to.

Feeling Bad can Lead Us to Give Up or Give In

Often, we seek relief or distractions when we feel bad. However, false rewards like shopping or drinking only lead to

KEY QUOTES

"We fail to recognize that the object of our desire is causing both the anticipated pleasure and the stress."

"The promise of reward doesn't guarantee happiness, but no promise of reward guarantees unhappiness."

"Desire is neither good nor bad—what matters is where we let it point us, and whether we have the wisdom to know when to follow."

"Feeling bad leads to giving in, and dropping guilt makes you stronger."

feelings of guilt and self-criticism to make things worse. Women who're worried about their finances may shop more, and dieters who're upset about their weight may binge-eat.

- We avoid *thoughts of death*, which terrify us. Shoppers who were asked to think about their death made longer shopping lists and were willing to spend more on comfort food. News reports of death made viewers more responsive to luxury product advertisements. Fear also leads to procrastination, e.g. we avoid seeing the doctor or writing a will.

Willpower Exercise: Notice what you do when you feel down or stressed. When you face setbacks, do you beat yourself up with guilt and self-criticism? What scares you the most?

A willpower failure may trigger the **"what-the-hell" effect** coined by Polivy and Herman. Dieters, smoker or drinkers who give in to temptation may feel so bad that they end up eating, smoking or drinking even more ("what the hell, I've failed anyway"). The more they repeat the cycle, the worse they feel.

- *Forgive yourself* so you can stop escaping from shame/guilt and start taking responsibility and control.

Willpower Exercise: Recall a willpower failure and reframe it with self-compassion.

- Observe your inner state when you think of the failure: what words, emotions and physical sensations surface?
- Accept that all human beings lose control sometimes.
- Consider how you'd comfort a friend who's in your shoes.

Beware of **unrealistic optimism**. We feel hopeful when we set an ambitious goal to change, but feel guilty and frustrated when we fail to meet those goals/expectations.

- It's better to exercise optimistic pessimism. Commit to change, then consider what may cause you to fail, and how to overcome them. Mentally prepare yourself by visualizing yourself taking action.

KEY QUOTES

"Stress points us in the wrong direction, away from our clear-headed wisdom and toward our least helpful instincts."

"We may think that guilt motivates us to correct our mistakes, but it's just one more way that feeling bad leads to giving in."

"The motivations we understand are always easier to change than the influences we cannot see."

Willpower Exercises:

- Do you resolve to change only when you feel bad? Do you take real action or are you using fantasies to feel better?
- Apply optimistic pessimism for successful change.

Soothe yourself with proven stress-relief strategies, e.g. exercise, praying, reading, music, meditation, massage, time with friends/ family. These release feel-good chemicals like serotonin, GABA and oxytocin.

Willpower Exercises: Try the stress-relief strategies above.

Instant Gratification Blurs Our Long-Term Vision

We can't see the future clearly since we undervalue long-term rewards, underestimate future willpower failures, or fail to address our future needs. We give in to temptations since instant gratification appeals to our dopamine-induced reward system.

- The more *immediate and vivid* the reward, the more likely the primitive brain will overwhelm the prefrontal cortex. In a study, both humans and chimps were given the option to eat 2 treats instantly or wait 2 minutes for 6 treats. Both humans and chimps preferred to wait for 6 treats. Yet when the treats were placed in front of them, humans only waited 19% of the time while the chimps waited 72% of the time.
- It helps to *distance yourself* from the temptation, e.g. hide the chocolates at the back of the fridge.

Willpower Exercise: Before indulging, force yourself to wait for 10 min and think of your long-term goal. If you're a serious smoker, pause for 10 minutes whenever you feel the urge for a cigarette. If you're trying to overcome procrastination, only allow yourself to quit after 10 minutes.

Delay discounting means that a reward seems less valuable if we must wait for it. The higher your discount rate, the more likely you'll choose immediate rewards over future ones.

- You can *improve your discount rate* by weighing the current temptation against the best-possible long-term reward.

KEY QUOTES

"Optimism can make us motivated, but a dash of pessimism can help us succeed."

"Our inability to clearly see the future clearly leads us into temptation and procrastination."

"We take what we want when we want it (now), and we put off until tomorrow whatever we don't want to face today."

Willpower Exercises:

- What future rewards are you sacrificing for immediate payoffs? How much are you discounting those future rewards?
- Lower your discount rate with these steps:
  (i) Ask: what's the best-possible long-term reward?
  (ii) Imagine yourself enjoying the reward as if it's already yours.
  (iii) Are you willing to sacrifice that for a fleeting temptation?

We tend to think of our future selves like complete strangers. We imagine them to be drastically better and more capable, while their needs seem distant and unreal.

- We prioritize our present needs and make bad decisions that *burden our future selves*. Students committed 3x more time to tutor fellow students in future than right now. They even agreed to consume more of a nasty drink next semester (compared to drinking it now).
- Spend some time to "connect" with your future self and strengthen *future-self continuity*. Students who spent time interacting with their future selves (via virtual reality) were more willing to save for retirement compared those who didn't.

Willpower Exercises:

- Are you putting off important tasks for Future You to handle?
- Get to know your future self:
  (i) Imagine the future you, making it as vivid as possible.
  (ii) Send an email to your future self, describing what you're doing now to meet his/her goals and dreams.
  (iii) Visualize how your ideal future self would feel, look and behave. Use that as a motivation to change.

Pre-commit yourself so you have no choice but to move ahead:

- *Create a default* while you're feeling calm and objective e.g. prepay for a healthy meal plan, or forbid withdrawals from your savings account until you've reached a specific milestone.

KEY QUOTES

"We put off what we need to do because we are waiting for someone else to show up who will find the change effortless."

"The more real and vivid the future feels, the more likely you are to make a decision that your future self won't regret."

- Make it *hard to reverse* your decision, e.g. don't bring your credit card when you go shopping.

- Motivate your future self with *rewards or penalties*. You can also get someone to hold you accountable.

Willpower Exercise: Pre-commit your future self.

Willpower is Affected by Social Influences

Social influence affects our personal choices and self-control. Scientists Nicholas Christakis and James Fowler found that obesity spreads like an epidemic. When a friend becomes obese, it increases your future risk of obesity by 171%. The same patterns are found in drinking or smoking.

Human brain cells contain mirror neurons to help us interpret and understand others' thoughts and feelings. If you see someone slicing her finger with a knife, you'll wince as if you were being cut. Likewise, we "catch" others' willpower successes and failures due to 3 social responses:

- *Unintentional mimicry*: we subconsciously mirror others' actions, e.g. you may unthinkingly reach for a drink when you see someone else doing so.

- *Emotional contagion*: we get infected by others' moods, which in turn affects how we respond to temptations.

- *Goal contagion*: You may decide to get an MBA or learn a new hobby after reading about someone else's experience.

Willpower Exercise: Consider the behaviors/habits you've caught from the people closest to you (and vice versa). Do others in your social network share your willpower challenge?

(i) The influence is bigger when you share a close relationship, like and identify with the person, or share the desire at some level. Since we hold conflicting goals in our minds (e.g. to indulge in sweets yet stay healthy), it's easy to get tipped in one direction.

(ii) We're more likely to be infected with self-indulgence than self-control, e.g. to splurge rather than to save.

KEY QUOTES

"Both bad habits and positive change can spread from person to person like germs, and nobody is completely immune."

"Social closeness matters more than geographic closeness."

(iii) We're also infected by what we infer from others' actions, e.g. if we see others flouting the rules, we may assume it's ok to loosen our self-control in all areas.

Willpower Exercises:

- Think of a positive role model for a willpower boost.
- At the start of each day, think about your goals and what could get in the way. You can immunize yourself against negative goal contagion just by being aware of it.

Social proof refers to our tendency to emulate others' actions, e.g. we choose the most popular dishes or watch the highest-rated movies. You're more likely to pay your taxes on time or conserve energy if you believe that everyone is doing it. Your perception matters more than what others actually think/do.

- We're motivated by our desire for approval or acceptance. So, the best way to inculcate willpower is to exert *positive social pressure*: (i) spread the belief that it's normal to exercise self-control and (ii) surround yourself with people who're doing the "right thing".

Willpower Exercise: If you're using "everyone is doing it" to justify an action, challenge the perception or switch to a tribe with more positive norms.

- *Social shaming* may be used to deter unwanted behaviors, but pride is more effective as an emotional leverage. We feel motivated to do the right thing when we believe others are watching us, so it's more effective to offer social support instead of shaming people. When participants did a weight loss program with a friend/family member, 66% completed the 10-month follow-up compared to 24% who did it alone.

Willpower Exercise: Make your willpower challenge public or enlist others to join/support you.

Denial and Suppression can Backfire

The more you try not to think about something, the more it occupies your mind—especially when you're tired or distracted.

KEY QUOTES

"Like germs that linger on a doorknob long after a sick person passed through, an action can be passed on to us when we merely see evidence that others have done."

"Willpower failures may be contagious, but you can also catch self-control."

"Social proof can strengthen self-control when we believe that doing the right thing (or the harder thing) is the norm."

"Trying to suppress thoughts, emotions, and cravings backfires and makes you more likely to think, feel, or do the thing you most want to avoid."

This is known as "ironic rebound". Women who tried not to think about chocolate ended up eating almost twice as many chocolates. Dieters who tried to suppress thoughts of food ended up binge-eating. The more frequently the thought returns, the more your brain assumes that it's true or important.

Willpower Exercise: What desire have you been trying to suppress or avoid? Has it worked? When you outlaw or suppress something, do you end up wanting it even more?

People suffering from anxiety disorders become more anxious when they try to suppress the negative thoughts/feelings. The best way to resolve mental suffering is to make peace with the issues.

- The best way to free yourself from bad thoughts/feelings is to *stop avoiding or fighting them*. In an experiment, people were coached to observe and accept their difficult thoughts and feelings, then imagine them dissolving with each breath. Brain scans showed that the intervention led participants to pay more attention to their self-critical statements yet feel less anxious.

- *Let your thoughts/feelings exist* without believing all of it or feeling compelled to act. In a study, students were given chocolates and told not to eat them. One group was taught to counter their urges by distracting themselves or arguing against eating the chocolates. The other group was taught to notice and accept their craving but remember that they didn't have to act on it. None of the students from the 2nd group ate their chocolates after 48 hours.

Willpower Exercise: Acknowledge your feelings, thoughts or cravings without acting on them. Notice the craving → Accept the thought or feeling (without avoiding/arguing with it) → Know you can choose not to act on it → Remember your real goal. Notice how the craving feels in your body, then imagine it passing out as you breathe.

- In yet another study, smokers were asked to go through each step of the smoking process—e.g. take out a cigarette pack, remove the cellophane, open the pack, put a cigarette in the mouth etc.—with a few minutes between each step so

KEY QUOTES

"Whatever fear or desire you try to push away will become more convincing and compelling."

"If we want to save ourselves from mental suffering, we need to make peace with those thoughts, not push them away."

"Paradoxically, permission to think a thought reduces the likelihood of thinking it."

"Feel what you feel, but don't believe everything you think."

they had to sit with their craving. Before the session, half the smokers were taught how to *surf the urge*, i.e. to imagine the craving as an ocean wave that swells in intensity then crashes and dissolves. They're to simply ride the wave as surfers. After 1 week, those who were taught to surf the turf had reduced smoking by 37% compared to the control group.

Willpower Exercise: Use this method to manage an unhelpful impulse. Imagine the sensations cresting and breaking like wave. Ride it without taking action nor pushing it away.

Redirect your mental energy to find solutions for your challenges instead of trying to avoid/suppress your feelings.

- Replace the bad habit with a *healthier habit*.
- *Redirect* the time/energy, e.g. instead of watching TV, learn to cook your favorite dishes.
- *Reframe* a "I won't" challenge into a "I will" challenge, e.g. instead of trying not to be late, aim to be 5 minutes early.

Willpower Exercise: Focus on "I will" instead of "I won't".

Conclusion & Other Details in the Book

Ultimately, self-control is built on 3 skills: self-awareness, self-care, and remembering your goals. The key is to be mindful of your choices instead of running on autopilot. McGonigal invites you to test each strategy and draw your own conclusions about willpower and what works for you.

This book includes details of numerous research studies, along with examples and suggested exercises to help you apply the ideas outlined in this summary. For more details, please visit kellymcgonigal.com.

KEY QUOTES

"These three skills—self-awareness, self-care, and remembering what matters most—are the foundation for self-control."

THE 1-PAGE MARKETING PLAN

Get New Customers, Make More Money, and Stand out From The Crowd

ALLAN DIB

The Big "So What"

This book provides a step-by-step guide for developing your marketing strategy and plan in 3 phases. Dib explains the marketing process in layman's terms, with practical insights that any small or medium-sized business can use to position the company, attract customers and create marketing systems for sustainable growth.

Introduction

For any business, money is like oxygen. A business that doesn't make money can't survive, much less create value or a positive impact.

- Technical skills alone aren't enough for business success, e.g. being a good designer doesn't mean you can run a good design firm. Likewise, a good product may help you to retain customers, but you need successful *marketing* to acquire the customers in the first place.

- You can always get more money, but never more time. That's why the most successful business owners invest money to save time (not vice versa), and focus on activities with the *greatest leverage*.

The 1-Page Marketing Plan is a powerful tool to help you crystallize and implement the high-impact elements of your marketing strategy.

- Most people confuse marketing tactics (e.g. SEO, podcasting) with strategy. To build a house, you must have a blueprint *before* you decide on the building techniques and materials. A marketing strategy is your

KEY QUOTES

"This book is about growing your business fast and reaping the rewards."

"Money isn't everything...but it ranks right up there with oxygen."
—Zig Ziglar

"The most successful entrepreneurs always start with marketing."

"You want to get really good at marketing because that's where the money is."

blueprint for getting your ideal target market to know, like, and trust you enough to buy from you. You need both strategy and tactics to succeed, but *strategy must always drive tactics*.

- The *80/20 Pareto Principle* predicts that the majority of your results will come from a minority of your actions. In any business, marketing provides the biggest leverage: a 10% improvement in marketing skills can lead to an exponential improvement in your bottom line. In addition, the 1-Page Marketing Plan captures the most critical aspects of the marketing planning process, to help you focus on the 20% of actions that will deliver 80% of your results.

- Small/medium businesses can't afford the expensive branding campaigns used by large companies like Coke or Apple. They must rely on *direct response marketing* which can deliver high returns even on small budgets. Direct response ads are trackable and measurable; they target a specific niche with compelling headlines and sales copy, a highly-targeted offer, a clear call-to-action, short-term and long-term follow-up.

- The 1-Page Marketing Plan breaks down the marketing process into *9 sets of activities over 3 phases of marketing*:

  (i) *Before*: when you help cold prospects to know you and indicate interest in your offering.

  (ii) *During*: when you get interested leads to like you enough to buy for the first time.

  (iii) *After*: when you get customers to trust you, buy regularly and refer others as raving fans.

We'll now zoom in on each of these 3 phases in detail.

KEY QUOTES

"If you want more success you need to start paying attention to and expand the things that give you the most leverage."

"Marketing is the strategy you use for getting your ideal target market to know you, like and trust you enough to become a customer."

The "Before" Phase (Prospects → Leads)

In this phase, your goal is to attract cold prospects, get them to know you and indicate their interest. To do so, you must (i) identify a specific target market, (ii) craft a compelling message and (iii) deliver your message via the right advertising media.

Select Your Target Market

Select a specific target market, so you can (i) focus your limited resources, and (ii) tailor a targeted message that's directly relevant to your audience. The more limited your resources, the more laser-focused you must be. When you try to target "everyone", it's like shooting arrows blindly in the dark hoping to hit something.

- A *niche* is a tightly-defined section of a sub-category. For example, within the broad category of "health and beauty", a specific niche could be "cellulite treatment for women who've just had a baby". A good niche is one that's "an inch wide and a mile deep"—it's extremely targeted, yet there're many people looking to solve the same problem. This allows you to be focused without limiting your business potential.

- Once you *become a specialist* at solving a problem that your target market badly wants to solve, price will no longer be an issue. That's why people pay so much more to a top brain/heart surgeon than a general practitioner.

- After you've dominated a niche, you can continue to *expand 1 niche at a time*. However, if you target too many groups at the same time, you'll dilute your message and resources.

Use the PVP index to identify your ideal customer segment. For example, photography can be further segmented into niches including: weddings, corporate, family portraits, and journalism. You can then rate each of these segments (on a scale of 1-10) against 3 factors:

KEY QUOTES

"By focusing on the right target market for your business, you'll be able to get a better return on the time, money and energy you invest."

"Trying to target everyone in reality means you're targeting no one."

"Targeting a tight niche allows you to become a big fish in a small pond."

"A specialist is paid handsomely to solve a specific problem for their target market."

- *Personal fulfillment*: how much you'd enjoy serving the segment;
- *Value to the marketplace*: how much the customers will pay for your work/solutions; and
- *Profitability*: How much profits you can make from serving the segment.

One of the best ways to truly understand your prospect is to create an avatar, or a detailed description of your prospect and his/her life. Consider the gender, age and location of someone in your target segment. Put yourself in their shoes: What are their biggest fears, desires, hopes, and frustrations? What are their decision-making biases? What media and websites do they use? What language/jargon do they use? What's the key emotion that drives them? What's the 1 thing they desire above all else?

Craft Your Message

To stand out, capture people's attention and motivate action, you need a compelling message that resonates with your audience.

- When you're crafting an ad, always consider 2 things: What's the *purpose and focus* of the ad?
- Each ad should only have *1 objective*. Make it clear what they should do next and what they'll get in return, e.g. visit your store for a free sample, or leave an email for a free report.

Convey your unique selling proposition (USP), or the reasons to buy from you instead of your competitor.

- Don't compete on the lowest price—a rival can always offer a lower price and you'll end up attracting low-quality clients. Instead, *differentiate yourself* so you can sell at a premium price.
- An USP has *2 components*: (i) why they should buy, and (ii) why buy from *you*? The ultimate test is this: if you remove the name and logo from the ad/website, can it be differentiated from your competitors'?

KEY QUOTES

"To stand out from the crowd you need to craft a compelling message that grabs the attention of your target market. Once you have their attention, the goal of your message is to compel them to respond."

"Marketing is an uphill battle if you haven't clearly clarified first in your mind why your business exists and why people should buy from you rather than your nearest competitor."

- Start by asking yourself: Of all your products and services, (i) which one will most certainly solve your target customer's problem, and (ii) which one do you enjoy delivering the most? Then, take the time to figure out *what your target market really wants*. Remember: people may not know what they want until they see it, and purchases are often made emotionally (then justified later with logical reasons). Consider the questions below, or use surveys and observations to gain deeper insights:

  (i) What's the biggest benefit from your solution? What are your customers *really* buying? E.g. when people buy insurance, they're actually buying a peace of mind.

  (ii) What emotionally-charged words/phrases can grab their attention, or what intriguing story can you tell?

  (iii) What guarantees or outrageous offers can you make to address their objections?

  (iv) What can you learn from others who've succeeded (or failed) to sell something similar?

- You can distill your USP by crafting an *elevator pitch* (a 30-90 seconds summary) of your value proposition. Try this formula: *"You know [the problem]? Well, what we do is [the solution]. In fact [the proof]."* Focus on the customer and their problem (or solution); don't focus on your company/product.

Once you know what they want, you can craft an irresistible offer.

- You can make your product more remarkable (to justify a higher price) without much higher costs. For example, you can deliver your coffee with beautiful coffee art (which costs almost nothing). To *make your offer more irresistible*:

  (i) Consider what's the biggest *value* or result you can deliver to your customer while still making a profit.

  (ii) Use their *language* or jargon, e.g. golfers may use words like "hooks," "slices", or "handicaps".

  (iii) Give a *reason* for an unbelievable offer (e.g. clearing old stocks).

KEY QUOTES

"People buy with emotions first and then justify with logic afterwards."

"Develop your USP, deliver on it and make those you deal with play your game, on your terms."

(iv) Use *value-stacking* to make the purchase a no-brainer. If possible, stack your bonuses such that the combined bonuses are worth more than the main offer.

(v) *Upsell* a complementary item (e.g. extended warranty)

(vi) Offer a *payment plan* for high-value items, e.g. an upfront payment of $5,000 sounds more scary than 12 payments of $497, even though the instalments add up to almost $6,000.

- People are always more willing to pay to remove an existing pain than to prevent a future problem. Instead of offering discounts, *resolve their pain* for a higher price, e.g. offer an all-in-one price for a wall-mounted TV with same-day delivery and installation.

Use effective copywriting that appeals to people's emotions and compels action.

- Don't be afraid to inject some *personality and emotions* into your communications, e.g. using a talking-head video to describe your offering, or using social media to engage with prospects and customers. An authentic, personal touch is always more effective than a stiff, "professional" approach.

- Ethically target *5 major emotions* behind buying behavior: fear, love, greed, guilt, and pride. Use *proven words* like: Free, Guaranteed, Proven, You, Save, Results, Money, Health, Love, New, Easy, Safety, and Discovery.

- You can create an immediate connection by (i) using your prospects' *language*, and (ii) targeting a *common enemy* (e.g. bad economy, lack of time).

- State *who your product isn't for*. This filters out unsuitable prospects, and makes you seem more credible to the right ones.

- If possible, choose a *name/title* that clearly conveys your solution, e.g. a handyman business called "Handyfix" is self-explanatory. Go for clarity over cleverness.

KEY QUOTES

"People are much more willing to pay for a cure than for prevention."

"People buy from people, not from corporations."

"We're all big bags of emotion and our buying decisions are made with emotion and then justified with logic later."

Reach Prospects With Advertising Media

Advertising is a good way to communicate your message to your target market, but it's also the most expensive part of your marketing. To get a good return on investment (ROI), you must choose and manage your channels carefully.

Today, it's possible to track and measure most of your marketing campaigns, to know exactly what works and what doesn't.

- A campaign is successful so long as it's profitable, i.e. your earnings are higher than your costs. Specifically, there are *2 vital numbers* you must know and track:

  (i) *Customer Acquisition Cost (CAC).* If you spend $1,000 to acquire 40 customers, your CAC is $25. If your average sale is $10, you'd lose $15 for every customer acquired (negative ROI). If your average sale is $60, then you earn $35 per customer acquired (positive ROI).

  (ii) *Customer Lifetime Value (CLV)* is the sum of your "front-end" sales (what you make upfront from a campaign) and "backend" sales (what you make from a customer's subsequent purchases). The latter is often much more substantial. So, even if your upfront sale is only $10, you'll still make money if your CLV is $100.

  These are only 2 numbers that matter. All other statistics (e.g. response rates, conversion rates) are secondary.

Here are a few examples of advertising media you can consider:

- *Social media* is basically a digital platform for social gatherings, so it's not a good idea to hard-sell there. Moreover, your social media pages aren't owned by you, so you can be removed anytime. Dib recommends using social media to give a human face to your business (e.g. sharing your opinions, responding to customer queries). However, build your own marketing assets (e.g. blogs, email lists, websites), and use social media to drive traffic to those assets.

KEY QUOTES

"What gets measured, gets managed."

"Rather than 'getting your name out there,' you'll fare much better by concentrating on getting the name of your prospects in here."

- *Email marketing*. Use a prominent opt-in form on your website to capture your visitors' email addresses, then nurture them over email. Success with this media depends on whether your emails are delivered, opened, and read.

  (i) Send 3 value-building emails for every sales-offer email.

  (ii) Use compelling titles to improve email open rates.

  (iii) Use a personal tone as if you're talking to 1 person, even though you're emailing to many people.

  (iv) Use a proper email marketing system (e.g. MailChimp, Aweber) designed for mass-emails.

  (v) Email regularly and automate your process where possible.

- *Snail mail* is still relevant in a digital age. A virtual bouquet of flowers simply can't create same emotional impact as a physical one.

Each media requires specialized knowledge. Once you've selected your media, hire experts for that specific media. Don't try to do it on your own. If a campaign is losing money, stop and change it.

- During the initial phase, *test everything*, e.g. your header, offer, and positioning. Set a budget for each test, allow yourself to fail frequently and quickly, and learn what works or doesn't.

- Once you've found a *winning formula* with positive ROI, you'll practically have an unlimited budget and can control how much you wish to spend on marketing. If demand exceeds supply, you can use the opportunity to increase prices.

- A business with only 1 major client, customer source or advertising media will be highly vulnerable. Dib recommends having *≥5 sources* of new leads and customers, of which the bulk are generated from paid media (with positive ROI).

KEY QUOTES

"Email doesn't replace postal mail, it complements it."

The "During" Phase (Leads → Customers)

In this phase, your goal is to nurture leads who're mildly interested in your offer, until they like/trust you enough to buy from you.

Capture Leads

The goal of direct response marketing is not to make an instant sale. It's to find people who're interested in your solutions, so you can gradually build trust and relationships.

- *Don't try to sell outright*. As a rule of thumb, only 3% of your target market is ready to make an immediate purchase. Another 7% is open to buying, and 30% is interested (but not right now). Of the remaining 60%, half aren't interested to buy and the rest won't use your solution no matter what.

- Instead of selling directly to the 3%, it's better to *capture the leads* in a database system, so you can follow up with the other 37% and build your future sales pipeline.

To get their contacts, offer an "ethical bribe" in the form of relevant information for a problem they want to solve. This should be an educational resource that's (i) valuable to your audience and (ii) can establish yourself as a trustworthy expert. For example, a wedding photographer could offer videos on how to choose the best photographer for the wedding day.

Nurture Leads

Nurturing leads is like farming, not hunting. Many salespeople give up after just 1-2 tries. In reality, most prospects must be nurtured over several contacts. The good news is, once you've earned their trust, they'll be ready to buy without any hard-selling on your part. There're 3 steps to being a "marketing farmer":

KEY QUOTES

"Like a farmer you prepare your prospects to become ready for harvesting."

- *Find people* who're interested in your solution. Position yourself as a teacher (not a salesperson) by offering relevant info for a problem they want to solve.

- Add them to your *database*.

- Continually *nurture* your leads and provide value so they'll remember you.

Once you have a database of high-probability prospects, keep offering value until they buy or drop off. To manage this process, you need to **build your marketing infrastructure**.

- Use a *customer relationship management (CRM) system* to consolidate all your customer interactions.

- Create *automations* to sort/filter your database, and manage triggers when certain actions are taken, e.g. when someone clicks on a link or submits a form. Once you've successfully automated a process, you can use it repeatedly.

- Over time, you'll accumulate a range of *marketing assets* in your infrastructure, e.g. lead capture websites, newsletters, email sequences, videos, podcasts, print ads, free reports, etc.

- The volume of snail mail has dropped drastically, making it easier for you to stand out and *make an impression* compared to the digital space. There are 2 ways to drastically increase the chance of your mail being opened and having an emotional impact:

  (i) A postal mail that's unusually thick ("*lumpy mail*") will catch people's attention. You can use memorable items, e.g. a thrash bag with the message "Stop wasting money", or a magnet with the message "Attract more clients."

  (ii) A "*shock and awe package*" is a physical box filled with unique assets that highlight the benefits of your solutions, e.g. books or DVDs explaining the problems you can solve for your prospect, client testimonials, product samples, gift cards, or handwritten notes. The pack should (i) provide extraordinary value for your prospect, (ii) position you as a trustworthy expert in your field, and (iii) move the prospect further down the buying cycle.

KEY QUOTES

"The lead nurturing process ensures that leads are interested, motivated, qualified and predisposed to buying from you before you ever try to sell to them."

"Let your competitors do cheap and efficient marketing while yours entertains, delights, inspires and wows. It will put you worlds apart."

- A successful business requires 3 types of people: entrepreneurs (who can identify market opportunities and envision solutions), specialists (who have the technical know-how to implement the vision), and managers (to ensure things stay on-track). It's impossible for 1 person to wear all 3 hats. Moreover, good marketing requires continual testing and refinement of your offers, headlines, etc. So, don't try to do everything yourself. *Automate what you can and delegate the rest*.

  (i) *Know what needs to be done by when*. Develop a calendar of daily, weekly, monthly, quarterly, and annual marketing activities, and a list of event-triggers and follow-up actoins.

  (ii) *Find the right people* to handle those activities. So long as the person can do the job 80% as well as you can, it's worth delegating the task. Remember: you can always get more money, but not more time.

Convert Sales

Never behave like a pesky salesman peddling a mass-commodity. If you do the previous steps properly, and position yourself as a sought-after expert who can improve your prospects' or customers' lives, they'll be *asking* to buy from you after some time.

Prospects are quick to judge your company's credibility based on first impressions, so make sure you present your business in a way that evokes trust and confidence:

- Regardless of the size of your business, your *website* must always look credible. Avoid common mistakes like poor web design, a lack of contact email, phone number, business address, privacy policy or terms of use.

- Never use a generic *email* address (e.g. gmail or hotmail). Invest in your own company email domain (name@company.com).

- Use a national toll free *phone number*, a toll free word or "vanity" number to improve your credibility and accessibility.

KEY QUOTES

"Making regular offers will make you a better marketer. Getting good at the science of marketing is the key to rapid business growth."

"Stop selling and start educating, consulting and advising."

"Instead of being a pest, I advocate becoming a welcome guest. Send your high probability prospects a continuous stream of value until they're ready to buy."

- Use a proper *CRM system* to track and manage your leads.
- Use a *ticketing system* to manage customer support or inquiries.

Identify your prospects' fears or perceived risks, then use "outrageous guarantees" to make it risk-free to buy from you. If you're in the pest-control business, you can guarantee that the pests will be removed permanently without toxic chemicals, and the house will be properly cleaned, or they'll get 2x the money back.

Your pricing strategy is one of the most critical components that affects all parts of your business. Yet, many businesses simply set their price just below the market leader, or do a cost mark-up.

- Less is more. Offer just *2-3 product variations*, with a premium version priced at about 50% above the standard variation but offering 200% (or 2x) the value.
- Remove perceived risks by offering an *"unlimited" version* of your service at a fixed price.
- Add an *ultra high-ticket item* to target your most affluent customers. As a rule of thumb, 10% of your customers will pay 10x more and 1% of your customers will pay 100x more.
- *Avoid discounts*. Instead, offer more value by upselling, cross-selling, or bundling related items that your customers will value.

To increase sales conversion:

- Institutionalize the mindset that *everyone is in sales*. Every person in your company—be it technical support or customer service—should be trained to (i) detect if a customer is interested to upgrade his service, and to (ii) move him forward in the buying process.
- Offer a *free trial*. This makes it easy for prospects to say "yes", and they're unlikely to stop the service or return the product so long as it meets their needs.
- *Remove hurdles to sales*, e.g. make sure you offer customers their preferred payment mode, or provide

KEY QUOTES

"When you can name the fears and guarantee against them in your marketing, you give yourself an overwhelming advantage over your competitors."

"Make it known that regardless of what their primary role in the business is, responding to sales opportunities is their job."

payment plans to break down high-ticket items into smaller monthly installments.

The "After" Phase (Customers → Raving Fans)

This phase is about converting your customers into raving fans, increasing their lifetime value and encouraging referrals.

Deliver a World Class Experience

Tribes are groups of people who're connected through an idea or leader. To build a tribe of raving fans, you'll need to (i) deliver a consistently wow experience, (ii) build lasting relationships, and (iii) be fun and easy to deal with.

Your ultimate goal is to help your customers to achieve results. If they fail to use your product in the intended way, they won't see results and will have no reason to stay or return, e.g. if they fail to start the 30-day health program that they purchased. So, it's not enough to sell them what they want; you must also give them what they need to get the desired outcomes.

- Break down the *post-purchase process* into bite-sized pieces and spoon-feed your customers so they'll take the required action to get the most benefits from their purchase. Help them to overcome potential obstacles.

Find ways to wow them with a superb experience:

- Use *innovation and showmanship*, i.e. creative ways to price, package, finance, market, deliver or support your product. For example, a restaurant can offer a pick-up and drop-off service to let their customers drink with a peace of mind. Blendtec used a series of videos to show how their blender (a typically "boring" product) can blend anything from golf balls to iPhones.

- Use technology to *reduce friction*, i.e. make the customer process as fast and seamless as possible. Think of each technology (e.g. website, email management software) as

KEY QUOTES

"Our goal is for our customers to achieve results."

"Sell them what they want but give them what they need."

"Buying it is just the first step. Putting it to its intended use is another."

"Your customers don't just want to be serviced. They want to be entertained. Give them what they want by creating a sense of theatre around your product."

an employee: what role are they hired to do and what's their key performance indicator (KPI)?

- Become a "voice of value" by sharing *insightful content and opinions* with your tribe.

- Don't just claim that your product is of the "best *quality*". Share exactly how much skill, effort, resources or attention go into delivering your product/service.

You can make money by selling products/services, but true wealth will come from building a **scalable, replicable business system**.

- A replicable business must include *4 crucial sub-systems*:

  (i) A *marketing system* to bring in a consistent flow of leads;

  (ii) A *sales system* to nurture and convert leads to customers;

  (iii) A *fulfillment system* to deliver what you promised; and

  (iv) An *administration system* (e.g. finance, human resource) to support the other business functions.

- These systems will allow you to consistently attract new customers, deliver a world-class experience, manage/reduce your operating costs, and potentially license, franchise or sell the business. If you're the sole business owner, such systems will also ensure that you don't become the bottleneck and have an *exit strategy* if you wish/need to stop working.

- To build your systems, start by *documenting the processes*:

  (i) Define the key roles in your business;

  (ii) Identify the key tasks performed by each role;

  (iii) Document how each task is performed (using checklists, video/audio training materials etc.) with clear steps and checklists for completing each task properly. These jointly form your operations manual or business know-how.

KEY QUOTES

"The purpose of any new technology in your business is to eliminate friction. We want the fastest and easiest path to the sale, while increasing customer satisfaction."

"Products make you money, systems make you a fortune."

"Systems allow mere mortals to run an extraordinary business."

"If you are indispensable, you are a bottleneck and the business will only move as fast as you can."

Increase your Customer Lifetime Value (CLV)

The real money is made by selling more to past or existing customers. Here are 5 main ways to do so:

- *Increase prices*. If your prices remain unchanged, you'll eventually earn less due to inflation. Explain the reasons behind the price increase (e.g. increase in quality or labor costs) to make it more palatable.

- Present a more expensive item, then *upsell* a relatively cheaper add-on, e.g. fries to go with a burger, a shirt/tie to go with a suit. You can use words like: "Most customers who bought A also bought B".

- *Upgrade* existing customers to a higher-priced tier, e.g. a more luxurious car model or a higher-speed Internet plan. Always include an ultra high ticket item in your product mix to (i) cater to your most affluent customers, and (ii) make the other items look comparatively cheaper.

- Increase the *frequency* of your customers' purchases through (i) reminders (e.g. post-cards, newsletters), (ii) reasons to return (e.g. cash voucher for next purchase), or (iii) recurring subscriptions.

- *Reactivate* customers who have stopped buying from you:

  (i) Identify customers who haven't made a purchase in a while;

  (ii) Create a strong offering to bring them back (e.g. coupon, free offer); and

  (iii) Contact them to find out why they didn't return (e.g. emails titled "We Miss You" or "Did we do something wrong?")

Track your key marketing metrics (on a monthly, if not weekly/daily basis) to know exactly how you're doing. These include: the number of new leads, conversion rate (of leads to customers), average transaction value, break-even point, CAC, CLV, recurring revenue and churn rate (% recurring customers who stop buying). Show these numbers on a dashboard so you can see the *real-time performance* of your business and be notified early if something is wrong.

KEY QUOTES

"Small hinges swing big doors."

"Filling the bucket is great but not if it's leaking at a rapid rate."

Retain good customers and remove bad ones.

- Generally, there are *4 types of customers*:

  (i) *Tribe members* are the raving fans and promoters of your business. They're crucial for your long-term growth/success.

  (ii) *Churners* can't really afford your services. They may buy during a sale, then leave and spread bad reviews about you.

  (iii) *Vampires* can afford your services but are more trouble than they're worth, e.g. those who make endless demands/complaints.

  (iv) *Snow Leopards* are high-value customers who contribute disproportionately to your revenue. However, they're extremely rare and can't be replicated.

- The *Net Promoter Score (NPS)* helps to classify customers into Promoters, Detractors or Passives based on their response to this question: "How likely is it that you would recommend our company/product/service to a friend or colleague?"

- Don't be afraid to *fire the problematic customers* who drain your time, resources and energy (including the detractors, vampires and churners). This frees you up to focus on the high-value tribe members and promoters.

Orchestrate & Stimulate Referrals

Hoping for word-of-mouth is like waiting for a free lunch. You need to proactively generate a steady stream of referrals.

One of the best ways to get referrals to simply to ask for them:

- *When you've delivered good results* for a customer, ask for referrals by appealing to their ego, offering something valuable they can give to others, and explaining how it'll benefit them too. For example, "Mr. X, we've truly enjoyed

KEY QUOTES

"If you take on toxic customers you'll generate polluted revenue, which makes your businesses sick."

"One of the best strategies for getting what you want in business and indeed in life—just ask."

working with you. If you know anyone who's in a similar situation as yourself, feel free to give them one of these gift cards which will give them $100 off their first consultation with us. Most of our new business comes from referrals from customers like yourself, which allows us to save on advertising and pass the cost-savings back to you."

- Set the expectations early *during the customer onboarding process*. Let them know that if they get great results from your service, you'd be asking them for referrals (in a way that would also benefit them).

Partner with complementary products/services who're likely to spend money to acquire the same customers.

- Consider the businesses your customers deal with *before* they engage your services. For example, if you're a pet food retailer, you can work with a vet to refer your services—offer a finder's fee, or provide gift cards which they can give to their clients.

- Find ways to monetize your customer database with the businesses your clients deal with *after* yours. For example, you may exchange leads (with permission from your customers), resell the complementary products/services, or become an affiliate referral partner.

Build your brand or the personality of your business. People can only get to know you after they purchase from you. Build brand equity or goodwill so people will want to continue doing business with you.

Conclusion and Other Details in the Book

This is a compact guidebook packed with useful insights and details to help any small/medium business owner or marketer to attract, nurture, convert and satisfy your customers to earn more money. However, they'll only work if you apply them. With practice, you'll deliver better value, refine your marketing process and see phenomenal results. You can find more details and download useful resources/templates at 1pmp.com.

KEY QUOTES

"Branding is something you do after someone has bought from you, rather than something you do to induce them to buy from you."

"Knowing and not doing is the same as not knowing."

COMPETING IN THE AGE OF AI

Strategy and Leadership When Algorithms and Networks Run the World

Marco Iansiti & Karim Lakhani

The Big "So What"

Artificial intelligence (AI) is transforming businesses and industries worldwide, creating new options that were simply impossible in the past. This book explains how individuals and companies alike can leverage AI-driven models to compete, grow, and thrive in the new digital economy.

Introduction

We are in the midst of an **AI revolution**. From healthcare to entertainment and retail, AI is reshaping how we live and work. In *retail*, AI-powered systems like Amazon vastly outperform traditional methods in predicting demand, automating restocking, and optimizing logistics. In *financial services*, AI is revolutionizing credit assessment and fraud detection, while in *healthcare*, it's driving earlier and more accurate diagnoses. Even in the *arts*, AI was able to recreate Rembrandt's painting style using algorithms and 3D printing.

This book explains how individuals and businesses can **harness AI's potential** to thrive in today's evolving digital landscape. In this summary, we've distilled and organized the insights into 2 parts:

- Transformation in the Age of AI; and
- Addressing Ethical and Leadership Challenges

KEY QUOTES

"AI presents new opportunities —for startups, established firms, entrepreneurs and intrapreneurs, for new economic, social, and political institutions, and yes, even for artists."

"AI is the 'runtime' that is going to shape all of what we do."
—Satya Nadella, Microsoft

"Our goal with this book is to provide leaders of organizations old and new, startups, and regulatory institutions a set of frameworks for understanding, competing, and operating in the age of AI."

Transformation in the Age of AI

Understanding the AI Revolution

During the **Industrial Revolution**, machines and new production methods drastically improved productivity, increased economic growth, and created new industries. However, they also disrupted labor markets, with many skilled artisans losing jobs to machines.

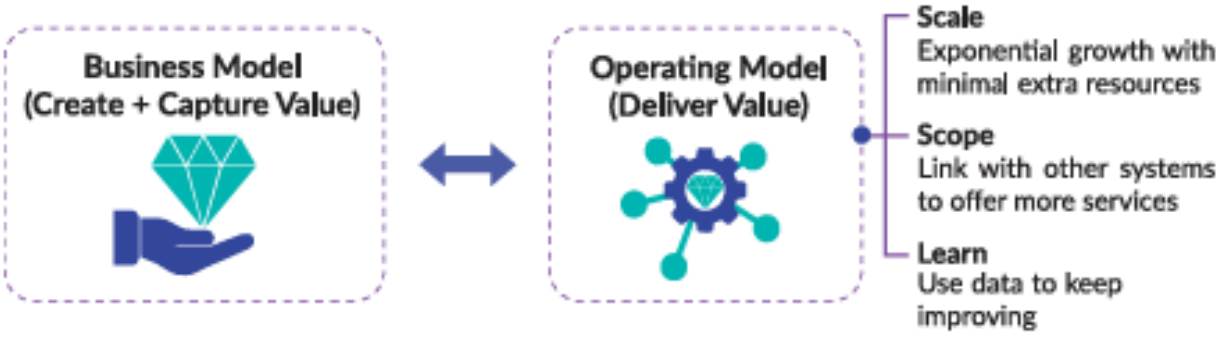
Today's **AI revolution** is similarly changing the dynamics of businesses, industries, and the global economy. It is reshaping the rules of competition and creating exponential improvements in efficiency and innovation. However, the impact of this revolution will be even faster and wider, due to AI's ability to learn, adapt, and scale rapidly.

Rethinking Business Models and Competitive Dynamics

AI-powered digital firms compete on a different playing field from traditional firms. To fully exploit AI's potential, firms must rethink their business and operating models.

A firm's success hinges on its **business and operating models**.

- The *business model* defines how it creates and captures value, delivering products and services that customers will pay for.
- The *operating model* includes the processes, systems, and capabilities to deliver that value efficiently with scale, scope, and learning.



KEY QUOTES

"AI is not only displacing human activity, it is changing the very concept of the firm."

"Strategy, without a consistent operating model, is where the rubber meets the air."
—Somewhat famous Italian proverb

"Whereas the business model creates a goal for value creation and capture, the operating model is the plan to get it done."

Traditional and digital models are drastically different.

- Most *traditional firms* rely on human decision-making and a hierarchical structure. Different departments operate in silos, and data are gathered, stored and processed inconsistently across departments, often on different IT systems.

  (i) This leads to *inefficiencies and wasted opportunities*, because it's hard to share information or see the big picture.

  (ii) Human-centered processes and decision-making also mean *manpower and resource constraints*, making it hard to scale up or adapt quickly to market changes.

- In contrast, *digital AI-driven firms* are built around data, software, and algorithms. This frees them from traditional constraints, allowing them to scale and adapt rapidly. Specifically, they can:

  (i) Automate operations and handle unlimited tasks without a proportionate increase in human labor *(scale)*;

  (ii) Easily integrate with other digital systems and platforms to offer more services *(scope)*; and

  (iii) Analyze huge amounts of data to continuously improve decision-making and operations *(learn)*.

Ant Financial is a prime example of how digital firms can achieve unprecedented scale, scope, and real-time learning.

- *Scale*: At the time this book was published, Ant Financial served over 700 million users with fewer than 10,000 employees. It could process over 120,000 transactions per second, due to its AI-driven digital infrastructure which automates processes like fraud detection, credit scoring, and loan approval. By comparison, the Bank of America served only 67 million customers with some 209,000 employees.

- *Scope*: Beyond basic financial transactions, Ant Financial also offers a comprehensive range of services, including payments (Alipay), investments (Yu'e Bao), credit scoring (Zhima Credit), and loans (MYbank). This ecosystem is powered by a centralized digital platform that integrates real-time data for decision-making, allowing Ant to monetize through scale and low transaction costs.

KEY QUOTES

"Devising and executing that operating model is where the real work would lie."

"The new breed of digital firms is all about innovation in the business model, experimenting and recombining various aspects of value creation and value capture."

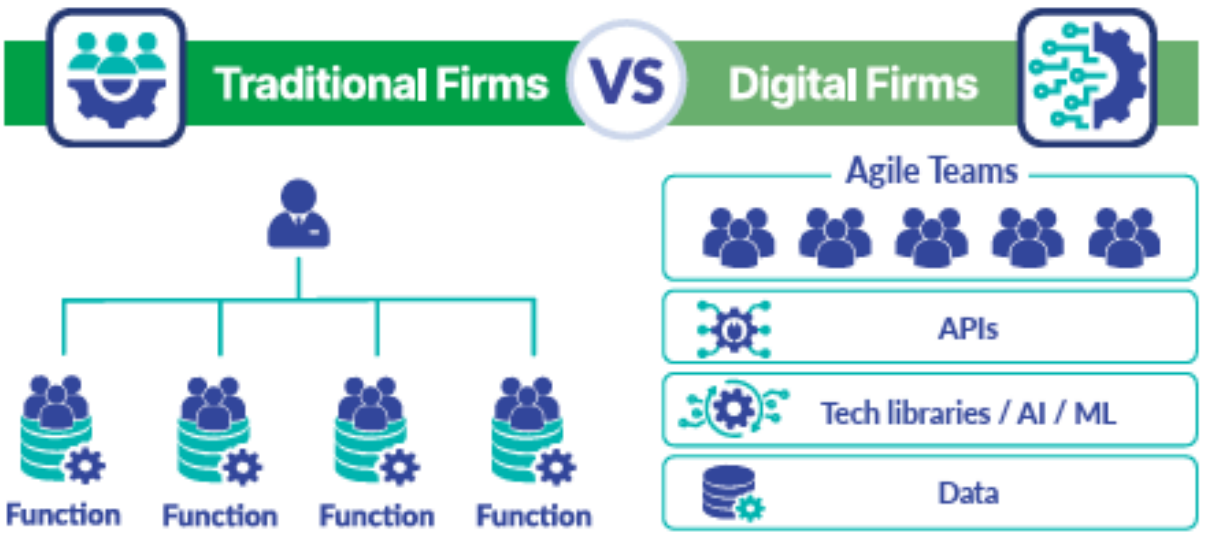
"Ant Financial is built with scale in mind. There is no way that a human-centric approval process can be deployed here."
—Ming Zeng, Alibaba

"Human beings can do everything that AI can do. They just can't do it to scale."
—Anne Marie Neatham, Ocado Technol

- Their algorithms *learn and adapt* real-time using customer data, so the larger they are the better they become at fraud detection, credit risk assessment, and personalized service offerings.

Rearchitecting the Firm

Business and operating models must be supported by the right business architecture. To thrive in a digital age, traditional firms must undergo a **structural transformation**—to shift from rigid, hierarchical architectures to flexible, data-centric ones.



AI-powered firms rely on **modular architectures** that seamlessly integrate data and software for agility and efficiency.

- The organization is built on *data as a foundation*. It continually collects, cleans, and stores in a unified way to ensure it's always accessible and consistent.
- *Technological libraries* house the AI and machine learning (ML) tools to analyze data, generate insights, and adapt/learn easily from new information without starting from scratch.
- *APIs* (Application Programming Interfaces) are the bridges that connect different pieces of software/data to avoid silos.
- *Agile teams* then use the digital tools to make data-driven decisions, quickly test ideas, adapt to changes, and implement solutions in real-time.

This setup makes AI-powered firms highly **flexible and scalable**. Instead of manual decision-making, they use real-time data and AI algorithms to repeatedly improve their operations, enabling them to grow quickly and adjust to changes.

KEY QUOTES

"A digital firm requires a different kind of operating model—one that is architected to take an integrated core of software, data, and AI and use it to power a new breed of organization."

"A firm's operating architecture has become a strategic consideration that should be thought through at the most senior levels."

"The organization reflects the system, and the system reflects the organization. This simple observation carries important implications for the evolution of firms."

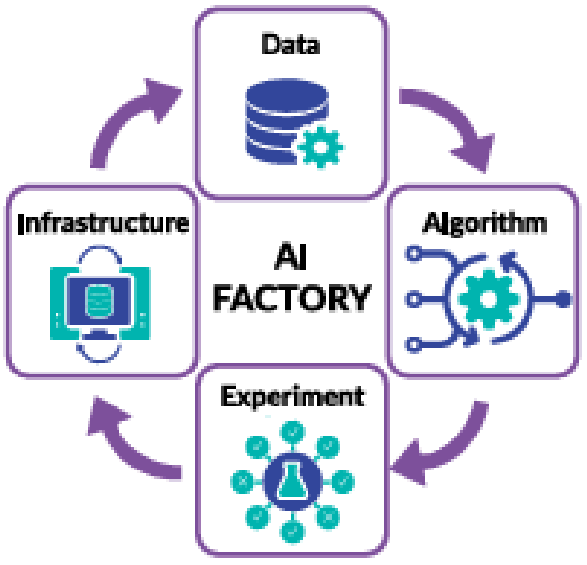
"In a digital operating model, the employees do not deliver the product or service; instead, they design and oversee a software-automated, algorithm-driven digital 'organization' that actually delivers the goods."

- In contrast, traditional firms face structural, resource, and technological constraints. Their outdated structure creates "*architectural inertia*," making even small changes hard to implement because they often require a total shift in how people think and operate. It's not just about technical challenges, but people's attitudes and entrenched processes.

The New AI Factory

The most advanced AI-powered firms operate like an "AI Factory" with minimal human inputs. Instead, they use **4 key components in a self-reinforcing cycle**.

- *Data* is gathered and refined;
- *Algorithms* use the data to make predictions;
- The predictions are *tested* to improve their accuracy; and
- The *software infrastructure* supports and scales these operations.



The stronger the algorithm, the better the results, and the more likely the company can acquire/retain users, which leads to even more data to strengthen the algorithm in *virtuous cycle*.

Data pipelines handle the flow of information in AI operations. They continuously gather data from multiple sources, clean it for accuracy and consistency, integrate it into a unified system, and safeguard data privacy and security.

AI relies on algorithms for decision-making. **Learning algorithms** create and refine computational models to interpret data, generate insights/predictions, and make decisions.

- A strong algorithm requires large, quality datasets and a robust infrastructure for rapid iteration/updates. There are different *types of learning algorithms*:

  (i) *Supervised learning:* Uses labeled data to predict outcomes, e.g. forecasting user behavior based on historical data.

  (ii) *Unsupervised learning:* Analyzes unlabeled data to

KEY QUOTES

"Frankly, the technology is the easy part. As many others have noted, organizational change is really hard."

"In its essence, the AI factory creates a virtuous cycle between user engagement, data collection, algorithm design, prediction, and improvement".

"Data is the essential input of the AI factory."

"The algorithms generate predictions about future states or actions of the business. These algorithms and predictions are the beating heart of the digital firm, driving its most critical operating activities."

uncover hidden patterns, e.g. grouping customers based on buying behavior.

(iii) *Reinforcement learning:* Learns through trial and error using feedback, e.g. optimizing marketing tactics based on user responses.

The **experimentation platform** tests hypotheses and validates new algorithms in a controlled environment before implementation.

- It provides a *continuous learning loop* to assess the impact of AI-driven decisions, and to rapidly iterate/refine the algorithms to enhance the overall efficiency and effectiveness of the AI Factory.

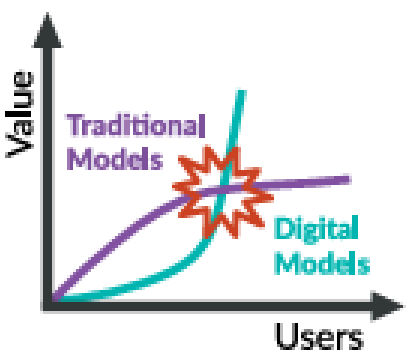
The **software infrastructure** supports the rest of the AI Factory. It provides scalable, reliable processing for large volumes of data, supports rapid adjustments to technological and market shifts, and ensures robust security and compliance.

Competitive Dynamics and Disruption

Strategic collisions occur when AI-powered firms directly challenge traditional companies, fundamentally shifting market dynamics.

Traditional and digital firms exhibit **different growth patterns**.

- *Traditional firms* often grow steadily until they hit natural limitations in resources or scalability.
- *Digital firms* grow slowly initially, then accelerate rapidly once they reach a critical mass of users and data. They continue to scale exponentially with data-driven strategies, making it hard for incumbents to compete.



Let's look at the **case study of Airbnb**:

- *Slow start*: When Airbnb was launched in 2008, it faced skepticism from the hotel industry, which was dominated by established hotel chains. Its initial growth was slow due to inconsistency in quality and a small user base.

KEY QUOTES

"If the data is the fuel that powers the AI factory, then infrastructure makes up the pipes that deliver the fuel, and the algorithms are the machines that do the work. The experimentation platform... controls the valves that connect new fuel, pipes, and machines to existing operational systems."

"Beyond shaping the fate of leading firms, the impact of these collisions is being felt across our entire economy and into our social and political system."

"The collision between digital and traditional travel companies shows what happens when traditional user needs are met in new ways by a different kind of operating model that digitizes some of the most critical tasks in the delivery of value."

- *Rapid scaling*: From 2011 to 2015, Airbnb rapidly expanded to over 190 countries, leveraging AI to optimize search, pricing, and recommendations, enhancing both host engagement and customer experience.

- *Market leadership*: By 2019, Airbnb surpassed the largest hotel chains with over 7 million listings worldwide. Its AI-driven platform kept improving, drawing in more users and data, and creating a network effect that traditional hotels struggled to compete with.

Shifting from Industries to Strategic Networks

AI-powered firms aren't just disrupting industries. They are transforming the global economy into a **massive digital ecosystem** that transcends traditional industry boundaries.

- This global network consists of many interconnected *subnetworks powered by AI*. They connect digital nodes across industries, enable seamless data interaction through advanced algorithms, and facilitate continuous learning and evolution.

- In this *network-based economy*, competitive advantage depends on a firm's ability to shape, control, and extract value from its digital ecosystems. Companies that leverage data and AI to dominate their networks (e.g., Google, Facebook, Tencent) have become central, global players.

Accordingly, companies must shift from industry analysis to **strategic network analysis**.

- *Industry analysis* assumes that industries are distinct and separate. It focuses on how firms compete in specific industries, and how to optimize internal resources and efficiencies within their own sectors.

- *Network analysis* focuses on how a firm connects with broader economic networks to shape data flow, learning, and competitive advantages.

Use strategic network analysis to understand your ecosystem, leverage opportunities and minimize risks, to **improve value creation and capture**.

KEY QUOTES

"Our entire economy is starting to resemble a vast, highly connected network coalescing around a small number of digital superpowers."

"Competitive advantage is increasingly defined by the ability to shape and control these networks and harvest the volume and variety of the transactions they carry."

"Just as industry analysis dominated strategy over the past few decades, we believe that network analysis will increasingly shape strategic thinking in the future."

"While creating real value for users, these companies also capture a large and expanding share of the value generated, and they're shaping our collective future."

- *Map out the business networks*: Start by mapping out the most critical networks connected to your business, such as links to customers, suppliers, or partners. Identify where value is created, and how data flows across the business landscape. For example, Uber's business involves its networks of riders, drivers, and food providers. Each network presents many opportunities to create and capture value.

- *Improve value creation* by exploring how to create more value as your networks grow and evolve. This could come from:

  (i) *Network effects*, where the value or utility of a product/service grows as more users engage with it. For example, the more users on a social network, the more valuable it is.

  (ii) *Learning effects*, where value is created as more data flows through the network, allowing businesses to learn and improve the service for users.

  (iii) *Clustering*, which is about focusing your efforts on specific areas/groups of people. For example, Uber might expand its ride-sharing services one area at a time, to better address the needs of users in each location.

- *Improve value capture* by exploring how your company can secure and retain the value created within the network. Some factors to consider include:

  (i) Reducing *multihoming*, which occurs when users or providers engage with multiple platforms (e.g. using both Uber and Lyft) thus diluting a firm's market share.

  (ii) Reducing *disintermediation*, which happens when users and providers bypass the platform once they've established a direct connection. Firms can counter this by lowering fees or adding unique services to retain their users.

  (iii) Increasing *network bridging*, i.e. connecting various networks to enhance value. For example, Alibaba linked its e-commerce platform to financial services, allowing it to use transaction data to offer credit.

KEY QUOTES

"These self-reinforcing loops in network and learning effects make a big difference in the nature of competition."

"Strategic analysis should examine the nature and potential of all applications to discover what uses may be made of complementary networks, considering the full variety of possible network interactions."

Building an AI-Driven Organization

After analyzing more than 350 enterprises across multiple sectors, the authors identified several principles and stages of AI transformation.

To make the transition from traditional to digital models, there are **5 principles for AI transformation**:

- *Strategic clarity*: Leaders must define clear goals, align resources behind those goals, and continually reinforce the vision.
- *Architectural clarity*: Have a clear vision of the future operating architecture, then integrate data, analytics, and AI into a unified framework to create a single source of truth.
- *Agile mindset*: Adopt agile methodologies, embedding AI into product design and decision-making at all levels.
- *Governance*: Go beyond technical security to develop ethical, responsible AI policies, engage stakeholders, and address societal impacts.
- *Capability development*: Invest in talent and build AI capabilities with robust data science.

There are usually **4 stages in becoming an AI-powered company**:

- *Siloed data*: Organizations begin with data dispersed across different departments. They might rely on basic tools like Excel spreadsheets, and outsource data analysis to external vendors or consultants.
- *Pilot projects*: Firms use small-scale initiatives to show the potential of data-driven decision-making, but without major structural changes.
- *Data hub*: Firms centralize their data to create a unified platform. This requires significant technological investments, as well as a cultural shift towards data-driven thinking.
- *AI Factory*: Firms develop a standardized AI operating model including centralized data, powerful algorithms, and modular software components. They focus on building AI skills

KEY QUOTES

"To operationalize a new strategy, especially one involving transformation, it's imperative that there be no doubt as to the seriousness of the effort, its sustaining power, and the clarity of the end goal."

"Even the most advanced AI factory in the world will not deliver the promised value if it is not embedded in an operating model that leverages its strengths."

"At the heart of it, building an AI-centric operating model is all about taking many traditional processes and embedding them in software and algorithms."

across the entire organization and continuously evolve their AI-driven systems to improve decisions and operations.

The last transition from Data Hub to AI Factory is the most challenging as it involves a complete overhaul of how data is used and requires capabilities to be built across the organization. However, companies that achieve these also saw the most **substantial benefits**, ranging from enhanced customer experience to risk mitigation, operational efficiency, and market insight.

Case studies: Netflix and Microsoft

Netflix is a great example of how firms can use data and machine learning to drive user engagement and operational efficiency.

- Netflix's AI Factory began with a *recommendation engine* that personalized user experiences, significantly boosting user engagement and viewer retention.
- As its subscriber base grew to millions, it leveraged its *expanding dataset* to generate deeper insights into user preferences and behaviors, such as:

  (i) *Optimizing thumbnail images* to create the most appealing visuals for each user to increase click-through rates;

  (ii) Predicting the *types of content* that would resonate with various audience segments, then producing or acquiring the ideal types of shows and movies; and

  (iii) Predicting drivers of *customer loyalty*, identify at-risk users and design personalized retention strategies.

- Today, Netflix has grown to *over 150 million subscribers* across 190 countries, delivering more than 5,500 shows on its platform.

Microsoft's transformation was even more comprehensive. To transit from a traditional to digital model, it had to address many cultural, operational, and technological challenges.

- When Satya Nadella took over as CEO of Microsoft in 2014, it was at risk of becoming obsolete. Nadella set a *clear and bold mission* to "empower every person and every

KEY QUOTES

"Ultimately, the AI-centric firm, with its vast variety of AI-driven processes, is the actual "product" of a modern, transformed, core services organization."

"The first essential principle in transformation is to develop strategic clarity and commitment."

organization on the planet to achieve more," signaling a move away from a Windows-centric strategy to a broader focus on cloud computing, AI, and cross-platform solutions.

- Microsoft invested heavily in *AI and cloud capabilities*, focusing on their cloud platform Azure, and integrating AI capabilities into Microsoft's software products like Office 365.
- They positioned Azure as a *modular digital operating system* that could be integrated with various technologies. They made Azure's architecture open and scalable, with the use of APIs, AI models, and data layers.
- They also formed *strategic partnerships* with other industry leaders, and acquired platforms like LinkedIn and GitHub to expand Microsoft's influence in AI and cloud. They developed a partner ecosystem that integrated Azure with other digital and AI-driven platforms to accelerate AI adoption across industries.
- These were supported by *cultural and organizational changes*, with a focus on continuous learning and collaboration. They broke down internal silos, encouraged data sharing and cross-functional innovation, and promoted a growth mindset with experimentation and embracing failures as part of the learning process.
- Under Nadella's leadership, Microsoft became a *leader in the cloud computing space*. Azure was positioned as one of the top cloud platforms globally, able to compete directly with Amazon Web Services (AWS).

Addressing Ethical and Leadership Challenges

To thrive in the new digital era, leaders must understand the new rules of the game, and address a range of strategic and operational challenges.

Understanding the New Rules in the Era of AI

As we've seen, the dynamics of businesses, competition, and the economy have changed. To compete effectively, organizational leaders must understand these new rules or meta in the age of AI.

KEY QUOTES

"Building this foundation will take time, but much can be done with a small number of motivated, knowledgeable people."

"Balance conviction with patience."
—Satya Nadella

"A new meta is like changing the moves allowed on a chessboard or the rules of bridge halfway through a game. The age of artificial intelligence is changing the game for all of us."

Change is widespread, not isolated. Changes driven by AI and digital networks affect entire systems, not just specific areas or industries. Such changes are instant and global, impacting multiple sectors, markets, and societies all at once.

Value creation is shifting away from physical assets and specialized resources to digital platforms and networks. Data has become the biggest competitive differentiator in this era, and firms that can gather, analyze, and act on data insights gain a significant edge over their competitors.

Conventional industry boundaries no longer hold. AI allows companies to easily expand their scope and enter/disrupt markets beyond their traditional areas of focus. Companies no longer need to specialize or compete just within their industry; they can quickly become significant players in entirely different sectors.

In a digital-first environment, processes are automated and optimized to run with **little/no friction**. AI-powered firms can adapt seamlessly to new inputs without traditional bottlenecks, moving and growing ever faster. However, they may also be more unstable, like a car without brakes that can't stop accelerating.

The **distribution of wealth and power will become even more imbalanced**. Not only do hub firms (e.g. Google, Facebook, WeChat) influence larger numbers of people and industries, they can easily link to one another to gain even more advantages over individual firms or standalone organizations. In fact, they're reshaping entire economies and the flow of power and value.

Ethics in the Age of AI

The rise of AI-driven companies presents 5 sets of ethical challenges.

Digital amplification: Digital platforms can amplify both positive and negative effects at an unprecedented scale. A small bias or error can grow exponentially as it spreads through digital networks to impact many users.

- For instance, during elections, false information about candidates can spread quickly, influencing public opinion and potentially altering the elections outcome.

KEY QUOTES

"Our new engine of change appears to be tackling all industries, globally, at just about the same time.

"We are moving from an era of core competencies, differing from firm to firm and embedded deep in each organization, to an age shaped by data and analytics, powered by algorithms and hosted in the computing cloud for anyone to use."

"Removing friction is not always a good thing. Frictionless systems are prone to instability and have difficulty finding equilibrium... Once in motion, frictionless systems are hard to stop."

"Leaders are finding their business and operating models at risk if they do not understand the dynamics of scope expansion."

"In new as well as old firms, leaders should be aware of how their newly deployed digital capabilities can be used and misused in ways they never intended—or possibly even imagined."

Algorithmic biases can be embedded in AI systems due to flawed data or prejudiced algorithm designs.

- This includes *selection biases* (where the data used for AI training isn't representative of the population it will serve) and *labeling biases* (where the labels applied to training data are influenced by human prejudices).

Cybersecurity: As digital ecosystems grow, so do their vulnerabilities to cyber attacks.

- Threats include *data breaches* (unauthorized access to a company's data like customers' details or financial records), *system hijacking* (attackers taking control of a company's systems/data for their own gains/purposes) and *ineffective responses* to cybersecurity threats..

Platform control: Digital platforms have immense power over what content is distributed, shared, or suppressed, affecting societal narratives and even democracy.

- For instance, companies like Google or Facebook can use their control over vast amounts of user data to limit competition by prioritizing their own products or services in search results and recommendations.

Fairness and equity: AI and digital technologies might disproportionately benefit some groups while excluding or leaving others behind. This includes people with less access to technology or those who are marginalized due to biased algorithmic decisions.

Leaders of digital organizations have the responsibility to ensure their technologies are used ethically and inclusively. These include:

- *Promoting transparency and accountability* to ensure AI-driven decision-making processes are transparent and understandable to users and stakeholders.

- *Ensuring fairness and inclusivity* in AI systems/design. Create multidisciplinary teams to audit AI algorithms for bias, promote diversity in data sources, and actively seek to remove prejudices in decision-making processes.

- *Building trust through ethical data use*: Prioritize data privacy and user consent and respect user preferences in data usage.

KEY QUOTES

"Navigating the ethics of digital scale, scope, and learning has become a universal management imperative."

"The same hub firms that benefit from the ecosystems they control have important reasons to sustain the economic health of not only their shareholders but also the broader communities they are organizing and serving."

"While the problem is real, it is also important not to fall in love with simplistic solutions...we should work to fix and improve digital operating models, and not destroy them.

"The greatest responsibility lies in the organizations that wield the most power and occupy the central network positions in our economy and society."

- *Strengthening cybersecurity and risk management* by investing in advanced cybersecurity technologies, training employees on data security best practices, and collaborating with industry experts to stay ahead of evolving threats.

- *Ethical decision-making and governance*: Establish ethical frameworks that guide AI and data-related decisions at all levels, such as ethical review boards to oversee AI projects, organization's strategic goals.

Navigating Leadership Challenges

Despite the massive potential of AI, most leaders and managers today are still using frameworks suited to a pre-AI world. Many of them lack the knowledge and flexibility for AI-driven business models, leading to a **gap between business potential and managerial approaches**.

Leaders of AI-powered firms must focus on **4 key pillars**, each requiring distinct skills and strategies:

- Leaders must guide their organizations through *continuous transformation* in face of rapid changes. This goes beyond digital upgrades to include a rethinking of business models, operations, and strategies. Leaders must create agile teams, flexible structures, overcome resistance to change, build technical expertise, and transform the organizational culture.

- *An entrepreneurial mindset* is essential for all types of companies today, not just startups. Leaders must foster a culture of innovation and agility, where people embrace ambiguity, experimentation, risk-taking, and data-driven decision-making.

- Leaders must also understand and influence the evolving *regulatory landscape* around AI and data. This includes navigating complex AI-related laws and policies, and balancing the need for innovation and compliance.

- Leaders are also responsible for building a strong, trusting relationship with customers, stakeholders, and the broader *community*. They must ensure that AI technologies not only address business goals, but also benefit society as a whole.

KEY QUOTES

"Most platform companies [seek] to shape and control its ecosystem and make sure that its tools and technologies do not cause harm. But how to properly exercise such control is not at all obvious."

"In contrast with the current wealth of data, analytics, and AI, we still appear to be suffering from a shortage of managerial wisdom."

"Managers will have their work cut out for them, as they reflect on their evolving role in our increasingly digital economy."

"Transformation…starts at the top, with motivating and grooming a generation of leaders to do the hard work involved."

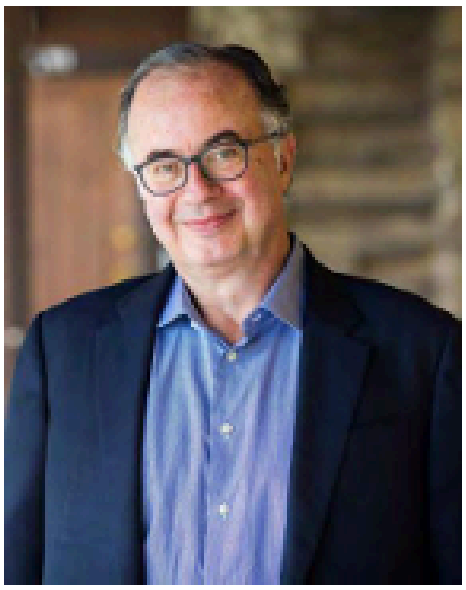
"Transformation does not apply only to traditional firms…every hub company must transform to survive and must do so repeatedly."

In this era, no single leader or individual can navigate the complexities of AI and digital transformation alone. Instead, we need **collective intelligence**—to leverage insights from teams, communities, and AI itself. This in turn requires: a learning and collaborative culture, diversity and inclusion, transparent decision-making, and balancing AI's analytical capabilities with human creativity and intuition.

Other Details in the Book to Look out For

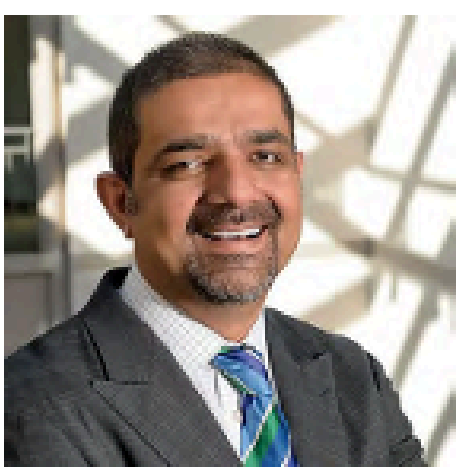
AI is here and it's already transforming every aspect of the business landscape. To thrive, we must learn to ride the wave of innovation. This book includes detailed case studies ranging from fitness to grocery delivery and finance, with critical insights and frameworks on how to adapt and thrive in the age of AI. For more details, please visit www.ageof.ai.

About the Authors



Marco Iansiti is a professor at Harvard Business School, specializing in the impact of artificial intelligence and digital transformation on business strategy and operations. He has numerous books and articles on innovation, technology, and strategy, and his research has shaped how leaders think about data-driven decision-making and the role of digital platforms in creating competitive advantage.

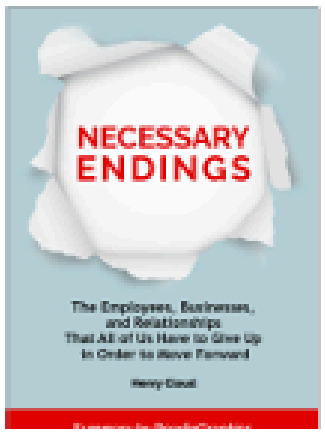
Karim R. Lakhani is a professor at Harvard Business School, where he leads research on AI, digital innovation, and crowdsourcing. He is well-known for his expertise in technology-driven entrepreneurship and the development of AI-based strategies for companies across industries.



KEY QUOTES

"We must find wiser ways to lead the increasingly digital firm...we must find better ways to manage the new assets and capabilities that are being created and deployed, every day, across every organization."

"There is no longer a rationale for staying behind, doubling down on old strengths and capabilities, and ignoring the emergence of a new operating model that is overwhelming every major sector of the economy... No organization should be standing still."



NECESSARY ENDINGS

The Employees, Businesses, and Relationships
That All of Us Have to Give Up
in Order to Move Forward

DR. HENRY CLOUD

The Big "So What"

Often, we must end something before we can begin something else. Yet, it's hard to know when an ending is necessary, and it's even harder to execute it. In this book, Dr. Henry Cloud explains why endings are so difficult, and presents specific strategies and tools to help us move on at the right time.

Introduction

Endings—such as a loved one's death, a divorce, or being laid off—are an inevitable part of life. When we avoid endings or handle them badly, we get stuck in problematic situations, miss out on opportunities, and repeat the same mistakes.

Often, we must end something bad before we can start something good. We may have to "kill" something that we created, or give up something we used to cherish (e.g. ending a toxic relationship or shutting down a failed project/business) to move on to something better.

- *There's a season for everything*: living and dying, building and deconstructing, mourning and celebrating, etc. We have to end infancy to start toddlerhood, and leave an old job to move to a new one. Likewise, businesses must let go of old products, strategies and business models to stay relevant.

- In this book, Dr. Cloud explains how you can *proactively navigate endings* to move toward your goals, and to bring relief, hope, and growth.

KEY QUOTES

"Today may be the enemy of your tomorrow."

"When we fail to end things well, we are destined to repeat the mistakes that keep us from moving on."

"Good cannot begin until bad ends."

"Often, in necessary endings, you have to give something up or be willing to lose something in order to gain it."

What are Necessary Endings and Why They Matter

All living things need energy to grow, and we have limited fuel to sustain that growth. To thrive and reach your full potential, you must channel your finite time, money, energy, and talents toward a specific vision. If you spread your resources too thinly, you'll dilute your focus and results.

To grow and thrive, we need 3 types of necessary endings. It's like how a gardener tends to a rosebush by pruning away 3 things:

- What is *good, but not the best*: All plants, such as rosebushes, generate more branches and buds than they can fully support. Gardeners remove the sub-optimal buds/branches to free up resources for the best roses to reach their full potential. Likewise, people and businesses take on more than we can handle sustainably, so we must prune away the less essential items.

- What is *sick and won't recover*: Sometimes, no amount of effort and resources can heal a sick branch. Gardeners prune away such branches to free up resources for the healthy ones. In our life and business, we get stuck with certain issues when we keep doing the same thing and expecting a different outcome. Learn to let go of the old in order to embrace the new.

- What is *already dead*: Dead buds/branches occupy space and block the healthy branches from reaching their full height and length. Likewise, we need to remove the stuff that take up dead space in our lives.

Despite their necessity, endings make us uncomfortable because it's human nature to avoid loss, pain and uncertainty. We don't want to confront or hurt others, or we may lack the skills to execute the endings effectively.

- Take a moment to do a "*gut check*". Examine your beliefs, thoughts and feelings about pruning and endings. What do you feel when you think about ending or pruning away something? Do you encounter any inner discomfort or resistance?

KEY QUOTES

"Are you only achieving average results in relation to where you or your business or team is supposed to be?"

"Both businesses and individuals will begin, gather, and have more activities than they can reasonably sustain."

"To do the same thing over and over again expecting different results is not only crazy, it is a recipe for staying stuck."

Before you start pruning, define the purpose and standards that you're pruning toward.

- Necessary endings should help to achieve your *strategic mission or purpose* in life. Consciously apply the 3 types of necessary endings—the good, sick, or dead—to all areas of your life, e.g. improving your relationships, business strategies, or project effectiveness.

- Former CEO of General Electric (GE), *Jack Welch*, is an example of someone who was crystal-clear on what he wanted. His relentless focus drove GE's revenue from $26bil to $130bil during his tenure. Welch based his pruning decisions on 4 criteria:

  (i) GE would only be in businesses where it could be #1 or #2;

  (ii) Any business that was struggling must be fixed, closed, or sold;

  (iii) The bottom 10% of the workforce was fired each year; and

  (iv) All layers of bureaucracy that hindered ideas, communication and productivity were removed.

Moving Forward with Necessary Endings

Normalize Endings

Start by seeing endings as a normal part of life, instead of seeing them as problems. This moves your brain out of fight-or-flight mode and into problem-solution mode.

See things as they really are, not as you wish them to be. Instead of hoping for things to remain unchanged forever or wishing for unlimited time/resources, accept reality so you can deal with it. Normalize endings with 3 organizing principles:

- *Embrace life's seasons and cycles*. Realize that everything moves in cycles, e.g. day and night, life and death. Match your activities to the life season that you're currently in.

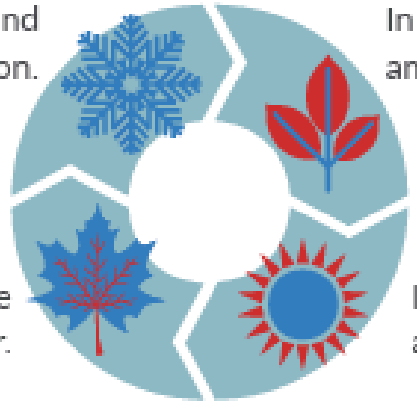
KEY QUOTES

"Pruning is strategic. It is directional and forward-looking."

"Pruning can bring health into the small branches of business or life as well as the big."

"If you see [endings] as normal, expected, and even a good thing, you will embrace them and take action to execute them."

"In business and life, there comes a moment when that reality must be seen and grasped."



(i) In *spring*, prepare the fields/resources, sow the seeds, and lay your foundations for growth. A business may build its network, hire new staff, or secure new clients.

(ii) In *summer*, tend to the crops, protect them from pests and diseases, and prune the plants as they grow. As a business grows, it must manage its resources and systematize its operations.

(iii) In *autumn*, harvest the crops before they deteriorate, taking care not to deplete/harm the fields. In business, you must be ready to harvest low-hanging fruits or opportunities.

(iv) In *winter*, close your accounts, organize your resources, repair your equipment, and review your successes and areas for improvement. Rest, regroup, and prepare for the new season.

Don't sow when you should tend, or tend when you should harvest. It's also unsustainable to stick solely to 1 season (e.g. to only sow or only harvest).

- *Accept that there will always be excesses in life*. Life generates more life, and every individual or organization will accumulate more things that they can sustain.

  (i) For example, you'll have more relationships than you can develop fully, more activities than you can sustainably commit to, or more things than you can store. When you juggle too many things, quality naturally drops. Good companies can have too many customers, partners and business activities, and must shut down certain programs or product lines.

  (ii) You will also have partners, products, or strategies that become outdated or irrelevant over time. Let go of what's no longer essential, so you can focus on what matters.

KEY QUOTES

"Believe in life cycles and seasons. They are real."

"When the numbers are too high, quality suffers."

- *Accept the existence of evil and terminal illnesses*. You will encounter destructive or incorrigible people who will harm or drain you. Protect yourself and cut them out of your life.

Examine your Internal Maps

Our beliefs and experiences shape how we see the world. Become aware of the mental maps that keep you stuck, so you can change them.

Neuroscience research found that the more we think and behave in a certain way, the more it creates and reinforces certain pathways in our mind. Eventually, we form mental maps which shape how we see the world, think and act.

- Pain is nature's way of telling us that something needs our attention. For example, if you put your finger over a flame, the pain alerts you to remove your finger quickly. However, we can get so used to pain that we assume it's the norm and there's nothing we can do about it. Psychologists call this "*learned helplessness*".

- When things seem helpless, use this exercise to regain a sense of control, get unstuck, and gradually *redesign your mental map*:

  (i) Create 2 columns on a piece of paper. On the left side, write down all the things *beyond* your control e.g. weather, market conditions. Then, on the right side, write down the things you *can* control e.g. reaching out to new contacts, learning a new skill.

  (ii) You can also brainstorm ideas/options as a team.

Your internal maps come from a mix of your **beliefs and past experiences**, especially those from your formative years. For example, you may find it harder to leave a dysfunctional relationship if your parents had a similar relationship. Consider if any of these 5 beliefs are holding you back from necessary endings.

- Having an *unusually high pain threshold*. You get so used to numbing or suppressing your pain that you tolerate issues which can/should be addressed, such as an under-performing employee or an abusive spouse.

KEY QUOTES

"Pain by its nature is a signal that something is wrong, and action is required. So pain should be driving you to do something to end it."

- *Covering for others* out of a desire to be responsible or nice. You end up shouldering others' responsibilities and thinking that everything depends on you.

- *Equating endings with failures*. You refuse be a "quitter" and persevere at all costs—even if it hurts your health and relationships, and there are better ways to use your energy, effort, and resources.

- Feeling *mistaken loyalty* toward others. You take on others' burdens at your own expense. You keep thinking "I'm doing this *to them*" instead of thinking "I'm doing this *for me*".

- Creating an *unhealthy dependency* by helping people who refuse to take responsibility for their own growth and outcomes.

Get to the Moment of Change

You need some hope to persevere in face of difficulties, but not so much that you live in denial and cling on to something long after it's time to let go. The "pruning moment" comes when we embrace reality and realize that it's hopeless to keep doing what we're doing.

Sometimes, such realizations come from past experiences.

- When Julie Shimer became the CEO at Welch Allyn, the company was in a leadership position, and the employees were satisfied with their existing products. However, Shimer's experience with Bel Labs and Motorola had taught her the risks of sticking to a "proven" technology. So, she hired a consultant to thoroughly assess the market and Welch Allyn's position. She concurrently worked with the team to define how they could best serve their clients (doctors and nurses).

- The team envisaged a future where medical staff could enjoy Welch Allyn's solutions with the same experience on any device, much like how Apple's products work seamlessly on a single platform. They quickly realized that the only way to achieve this vision was to phase out the technology they had used for almost 100 years, and to adopt a new integrated platform for all their medical devices.

KEY QUOTES

"Failing well means ending something that is not working and choosing to do something else better."

"Necessary endings happen when you get to a 'good hopelessness'."

"To continue our legacy of being a leading innovator, we had to change to a new and much bigger chapter in Welch Allyn's history."
—Julie Shimer, former CEO of Welch Allyn

If you don't have the experience to know if an ending is necessary, you must rely on diagnostics (below) to gauge if there's real hope for change, or if you're just engaging in wishful thinking.

To identify if you should keep investing time/effort in someone, or if you should initiate an ending, look at their track record.

- Have they *consistently performed* up to expectations in the past?
- If not, are some of these *9 factors* present to suggest that things could change in the future?

  (i) Participation in *valid change processes*, e.g. rehabilitation or counseling.

  (ii) New change structures, e.g. scheduled updates to a trainer.

  (iii) Monitoring systems to track progress/performance.

  (iv) New skills, experiences, or know-how.

  (v) A real need to change, with signs that they're taking ownership of the problem and actively looking for solutions.

  (vi) Self-motivation to sustain the change.

  (vii) Support from like-minded people (e.g. we're more likely to become overweight if we're surrounded by overweight people, and vice versa).

  (viii) Help from people with the right skills/experience.

  (ix) Evidence of success or progress.

  Without these factors, you must expect more of the same from that person.

You can also diagnose someone's character. Know which of these 3 types of people you're dealing with, and adapt your strategy to the person/situation accordingly.

- *Wise people* embrace feedback and adjust their behaviors accordingly, to gain wisdom from their experiences. They

KEY QUOTES

"Nothing mobilizes us like a firm dose of reality...only reality gets us to do difficult things."

"The best predictor of the future, without other variables, is the past."

"It is often irrational to listen to a seemingly good idea from a proven nonperformer."

"We are looking for some sort of movement, instead of ongoing stagnation."

"While hope is a great virtue, hope in unreality is not."

"When truth presents itself, the wise person sees the light, takes it in, and makes adjustments."

genuinely regret it when their actions create a negative impact on others, and seek to improve.

  - When dealing with wise people, talk through the issues, discuss possible strategies, and give them resources to solve the problem.

- *Foolish people* are the opposite. They're unreceptive to feedback, find excuses for their actions, and blame other people or external circumstances. They dismiss their impact on others, refuse to take ownership of the problem, and even see themselves as the victims.

  - When dealing with foolish people, don't bother discussing the problem or giving them resources because they won't listen or change.

  - Instead, set clear limits and consequences. Highlight the lack of change/progress, set limits to minimize the negative impact on others, and let them feel the repercussions of their action/inaction. For example, "Jim, we discussed this issue several times, but there has been no improvement and it has affected the entire team's performance. If this next deadline is not met, I'll be replacing you with someone who can do what's needed."

- *Evil people* will seek to harm or even destroy you.

  - When dealing with such people, don't try to help or change them. Protect yourself physically, emotional and financially. Distance yourself as much as possible, and preferably limit any communication through lawyers or law enforcement officers.

Don't expect people to change long-standing patterns of behavior unless there's strong evidence of the 9 factors above to suggest otherwise. However, you can facilitate changes by:

- Helping people to operate optimally in their areas of *strengths* rather than weaknesses. If your colleague or spouse is better at technical details, don't push them to work on creative tasks.

- Bringing in the right *wisdom or know-how*, e.g. hire consultants or experts who have the skills/experience that you lack.

KEY QUOTES

"The fool tries to adjust the truth so he does not have to adjust to it."

"Whereas you talk to wise people about problems and you talk to fools about consequences, do not talk to evil people at all, period."

- Infusing the right levels of *energy and structure* to drive the change. This could come in the form of additional manpower, partners, daily reviews, or monthly meetings. It's like having a regular intake of food/nutrients to sustain your body.

Make the Change and Sustain It

Endings are hard. Without deliberate effort, you're likely to avoid them or return to old patterns/habits.

There are several internal barriers which can hold you back from a necessary ending.

- Such *barriers* include:

  (i) *Conflicting desires* that keep us from acting decisively. For example, you believe you should end a relationship, but you also believe it's bad to hurt others.

  (ii) A *hoarder mentality*, which is associated with the fear of losing out. You hold on to things just in case you need them in the future, or cling to outdated ideas/models in hope that things may turn around.

  (iii) *Putting things off* by telling yourself you'll do it "later", or justifying the status quo by looking selectively at the good aspects while neglecting the bad ones.

- *See the full picture*—both the good and the bad—so you can deal with the situation more realistically.

- Be clear on your desired outcome, but *hold it loosely* so you can adapt if circumstances change. Don't cling on to something (e.g. a title or relationship) too tightly, as it may actually increase your risk of losing it.

You're also likely to encounter external barriers to change. This includes people who resist/thwart your efforts because (i) the change doesn't serve their interests, (ii) they feel threatened by your progress, or (iii) it's simply their nature to oppose any idea regardless of whether they have valid reasons.

KEY QUOTES

"Endings, no matter how needed, are hard."

"Incompatible wishes are a formula for resistance."

Create urgency and momentum to initiate and sustain change. Concurrently play up the fear of bad things that will happen if you don't take action, as well as the rewards if you do.

- Imagine the future as vividly as possible, like playing a movie in your mind. If you're frustrated with a colleague's non-performance, imagine speaking with him/her on the same issue 6 months, 1 year, and 2 years from now. *Experience the future misery* now so you'd feel motivated to act.
- Concurrently hold a *clear vision* of the future you'd enjoy if you take action today. Regularly see, hear, and feel the details as if you're already living it. Write it down, talk about it, and surround yourself with pictures that remind you of the vision. Get attached to that future so you'll be motivated to stay on the path.
- If the people who must make the changes are too distant from the problem, get them to *experience the pain first-hand*. For example, get product developers to use their products or observe customers struggling with them.
- Find *allies or supporters* who will support your goal and push you to move forward. Surround yourself with people who already live the desired end-state. At work, find influencers to spread the new norms. If necessary, bring in external resources (e.g. a coach or accountability partner), or get someone with authority to step in.
- *Establish structure* in the form of timelines, milestones, action plans, review sessions, resource allocation, and so on.
- Set *firm deadlines* with specific consequences if the requirements are not met.
- Track your *key metrics* to monitor if you're making progress.

Equip Yourself for Success

Master the skills and strategies to execute endings effectively.

Use self-selection to achieve your desired outcomes without having to judge or reject people. Set your standards clearly, then let others decide if they're willing to match your standards.

KEY QUOTES

"We need is to make the threat to our future as real in our minds as it is in reality."

"The external structure creates the rails for the train to run on."

- For example, a woman was in a dilemma because she couldn't decide if her boyfriend was the right partner for her. At Dr Cloud's suggestion, she explained the situation honestly to him—that she loved him but couldn't see herself marrying him unless he started to plan ahead and take financial responsibility for their future. By laying out what she wanted, she could stay true to herself and let *him* decide if he was willing to change to be with her.

Ending conversations can be difficult and uncomfortable. Unless you prepare for the conversation, you're likely to side-step the issue.

- *Specify your end-goals* in advance, e.g. "to express that I care for him", or "to say that I'll call the police if he contacts me again".

- *Address conflicting desires*. Come to terms with the fact that you can care about someone, yet have to share a painful truth for their own good. Commit to be clear, honest, yet compassionate.

- Prepare the key points or a script. Then, get someone you trust to *rehearse the conversation* with you and provide feedback.

- *Adopt the right tone*. People tend to be more receptive when you adopt a soft/caring tone, empathize with them, and validate their feelings.

- *Separate the issue from the person*. Validate the person and the relationship, while clearly explaining why the issue necessitates an ending.

- *Invite the person to repeat* what he/she heard, to ensure the message has been clearly understood.

- Once you've truly decided on an ending, *do it decisively*. Don't leave loose ends to be tied up later. So long as you're clear and kind in your communications, the outcome will usually be positive.

- As a rule of thumb, don't burn bridges except with evil people. In those cases, you should consider having a third party (e.g. a lawyer, HR personnel, or friend) to join you as a *witness*. Make sure you document the discussion clearly in writing.

KEY QUOTES

"Just as in pulling a tooth, quickly and thoroughly is usually best."

"Don't leave an open door or window if you don't want one. Close it now, so you will not have to do it again."

Internalize the ending so you can move toward your desired vision.

- *Embrace the grief* rather than avoiding or denying it. This helps you to accept the ending and move on. You can even hold a symbolic "funeral" to create a proper closure.

- Take some time to *dissect the experience* so you don't repeat the same mistakes or patterns. Ask yourself: (i) what can you learn from the experience, and (ii) what should you consciously let go? It's like how your body metabolizes food by breaking it down into nutrients (that you absorb) and waste (that you discard).

Conclusion and Other Details in the Book

To live to your true potential, you must make the most of where you are right now, *and* do what's necessary to move toward your vision. Start by taking stock of the things that are draining you emotionally, physically, mentally, energetically, spiritually or financially. Then, look for ways to stop and reverse the negative outflow. If that's not possible, then it may be time to plan an ending.

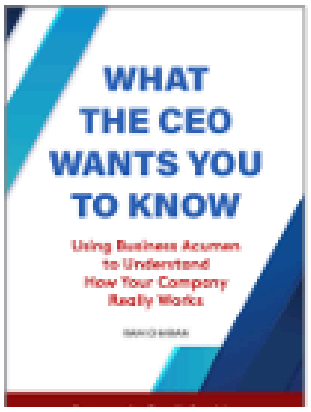
This book is written in a casual, conversational style, with many real-world examples and anecdotes from the author's experiences. For more information, please visit https://www.drcloud.com/.

About the Author

Dr. Henry Cloud is an author, coach, speaker, and clinical psychologist. He has authored 45 books, and coached many leaders, executives and teams on performance, leadership skills and culture. Dr. Cloud founded and built a healthcare company for 10 years, before selling the company and devoting his time to consulting, coaching, speaking, and writing. He holds a BS in psychology with honors from Southern Methodist University, and a PhD in clinical psychology from Biola University.

KEY QUOTES

"At any given moment, you are an amalgam of what has happened up until that moment."



WHAT THE CEO WANTS YOU TO KNOW

Using Business Acumen to Understand How Your Company Really Works

RAM CHARAN

The Big "So What"

To do well in any profit or non-profit organization, you must understand how your company truly works. This book helps you to develop business acumen and learn the universal language of business. It allows you to become better at any job, feel more engaged and fulfilled with your work, and make a bigger impact.

Introduction

Every business has the same fundamentals. This is true for a roadside stall or a Fortune 500 company, a profit or non-profit organization. Great CEOs (i) possess great business acumen and (ii) help everyone in the company to understand these fundamentals.

The insights in this book are relevant for business leaders and anyone who wishes to make a bigger impact in their work. They're especially helpful for 2 groups:

- *Millennials* born between 1982-2000 who will be propelling the digital revolution and holding key leadership positions in the coming decades; and
- *Business-to-business (B2B) salespeople* who must understand their clients' businesses in order to prove that they bring real value.

This summary is organized in 2 parts: (i) learning the 4 business fundamentals, and (ii) applying the fundamentals in the real world.

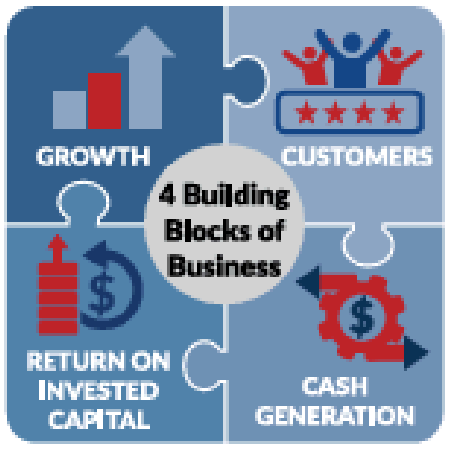
KEY QUOTES

"The best CEOs are like the best teachers."

"I want to share with you...what the CEO wants you to know, so that you can learn, grow, and make a greater contribution to not only your organization but the world around you."

Mastering the Universal Language of Business

All businesses—regardless of size, type or industry—have the same 4 building blocks: customers, cash generation, return on invested capital, and growth.



- Imagine you're a *street vendor* selling food.

  (i) You must decide how much ingredients to buy based on how much you expect to sell that day (sales forecast). You must decorate your stall (retail display) or compare what rivals are doing (market analysis). You must set prices and possibly offer discounts at the end of the day to get rid of the perishables. You might shout to catch customers' attention (advertising) or add set-meals and promotion items (product bundling and customer value).

  (ii) You must also consider your profit margin (how much cash you keep as a percentage of the total cash you earn). You may increase your margin by raising prices (but not so much that you lose customers) or buying cheaper ingredients (provided it won't hurt your food quality). You may also consider whether to add more dishes or just sell a few high-margin items. You know you're doing well if you generate enough money to buy the next day's ingredients and still have extra cash left in your pocket.

- Likewise, an *automobile company* must decide how much materials to order, what prices to set, when to run a promotion, and how to do so without cheapening the brand. They must decide whether to invest in a new manufacturing plant and make sure they have enough cash to pay for production, rental, operations and employees' salaries.

- Operating a public-listed company is more complex than running a street stall. Yet, *the fundamentals are the same*. The street vendor merely juggles all 4 building blocks in his mind while a large corporation must do it on a much bigger scale. They must:

  (i) Satisfy *customers* better than competitors;

KEY QUOTES

"The language of business is the same everywhere."

"Business is always changing, but the basics remain the same."

(ii) Generate enough *cash* to stay in business;

(iii) Produce a *good return* on the money invested in the business; and

(iv) *Grow* the business profitably.

To do well, a business must master all 4 fundamentals and integrate them.

- Most employees see their work through their *specializations or silos*, e.g. engineering, sales, or accounting.
- Once they can *see the big picture*, trade-offs and interdependencies across functions, they'll be in a better position to help the business to grow and thrive. In the process, they'll feel more connected to their work and company, can identify opportunities, make better suggestions, create a greater impact and accelerate their career progression.

1. Customers

You can't have a business without customers, and a company can only thrive if it has satisfied customers.

- Know your *customers* (the people who buy your products) as well as your *consumers* (the people who use your products). For example, Procter and Gamble must consider the needs of its customers (retail stores like Target) and end-consumers (people who use their diapers, shampoos etc.)
- Know *what your customers/consumers are truly buying* and why. Are they buying your product, or are they actually buying convenience, reliability, or a peace of mind? You earn their loyalty when you can consistently deliver what they truly need/want.

The best way to understand your customers is through personal observations. Don't rely on surveys, focus groups or analytics alone.

- Study the *end-to-end customer experience*, i.e. how customers interact with your product at every step of the buying journey.

KEY QUOTES

"No matter what we do for a living, will be better at our jobs if we learn how moneymaking tools are applied within our organizations."

"Learning to speak the universal language of business will advance your career."

"If you don't have a customer, you don't have a business."

"The CEO wants you to know your company's customers."

(i) If you're a retailer, try observing how many customers leave your store without making a purchase. Identify the stores they visit before yours (by looking at the shopping bags they carry) and the ones they visit after that. Talk to a handful of customers each week to learn what they're thinking.

(ii) Speak directly to your end-users as well as your distributors or wholesalers (if any). Don't go through a middleman.

- Once you have an insight (e.g. changes in lifestyle or new products they may like), *test it with the customer*.

2. Cash Generation

Any business needs cash to operate and grow. Cash generation refers to the difference between cash that flows *into* the business and cash that flows *out* of it, in a given period of time. This is also known as "cash flow."

- Sources of *cash inflow* include: cash, checks, credit card payments and product sales.

- Sources of *cash outflow* (how the money is used) include: salaries, taxes, or payments to suppliers.

Know the difference between cash vs income.

- Most companies sell their products/services first and collect the money later. The money owed to them is called *accounts receivable*. They also buy supplies first and pay for them later. The money they owe is called *accounts payable*.

- Companies can *get into trouble* due to low margins, high expenses, or when they take too long to sell their products and collect receivables. Look for warning signs such as decreasing cash, income or profit margin. A company goes bankrupt when it doesn't have enough cash and can't borrow more.

- On the other hand, a company with cash can invest it to *build capabilities* to generate even more cash. Take Amazon for example. It started out by selling books without any book inventory. It processed the orders online and shipped them

KEY QUOTES

"Invested wisely, cash improves the company's moneymaking ability."

directly from others' distribution facilities, which meant they could receive money from customers upfront and pay for the books much later. The cash generated could then be used for marketing to bring in even more sales. Amazon later added a variety of third-party products, which allowed them to earn commissions without carrying inventory or handling fulfillment.

Any employee can contribute to cash generation. Know your company's cash situation and how to improve it. Ask yourself:

- Is your division or department generating cash for the company? Is your company generating *net cash*?
- Which of your own actions generate cash or use cash? How can you *improve cash generation*? For example, a sales rep can negotiate for clients to pay in 30 days instead of 45 days. A production manager can reduce inventory levels to free up cash. Even mailroom clerks can ensure outbound invoices or inbound checks are processed asap so they're converted to cash.

Gross margin is crucial to cash generation.

- *Net profit margin* = Revenue minus all expenses, *including* all operating costs, taxes and loan interest payments.

$$\text{Net Profit Margin} = \frac{\text{Revenue} - \text{All Expenses}}{\text{Revenue}}$$

- *Gross margin* = Revenue minus the costs of goods sold (COGS). COGS refers to the costs *directly* associated with creating the product/sale, such as materials and direct labor costs. It *excludes* other costs like taxes, interests, distribution or general administration. It tells you how profitable a product is, e.g. if you pay $60 for ingredients and labor for every $100 sold at your food stall, you have a gross margin of 40%. You can increase your gross margin by changing your mix of products, customers, prices, distribution channels, and the material/labor costs involved.

$$\text{Gross Margin} = \frac{\text{Revenue} - \text{Cost of Goods Sold}}{\text{Revenue}}$$

KEY QUOTES

"If you understand gross margin, you are well on your way to understanding the heart of the business."

3. Return on Invested Capital (ROIC)

Every business uses money or capital. This may be its own money (profits accumulated from previous years) and/or someone else's money (e.g. money from banks and shareholders). The Return on Invested Capital (ROIC) shows how well you're using the money. The bigger the number, the better.

$$\text{Return on Invested Capital (ROIC)} = \frac{\text{Net Income}}{\text{Total Invested Capital}}$$

R = M x V. Simply put, ROIC depends on your *margin* (how much you earn for every product sold) and your *velocity* (how quickly you move products through your business).

$$\text{Return (R)} = \text{Margin (M)} \times \text{Velocity (V)}$$

- Velocity is also known as "*inventory turns*", or how many times your inventory turns over within a period of time. Walmart has 360 inventory turns in toilet tissue per year, which means it sells all of its toilet tissue almost daily.

- *The faster your velocity, the higher your returns*. Consider how long it takes your company to convert raw materials to a finished product that's sold, or how long it takes from the time you receive a customer order to the time you deliver the product. If you take 90 days to produce and sell a car, it means your cash and potential profits are tied up for 90 days. How can you help to improve ROIC through your work?

- ROIC is especially crucial for companies with a lot of *fixed assets* (e.g. machinery and factories). If you can grow your business using existing assets, you'll conserve cash and get higher returns on your assets. For example, AT&T can maximize the returns from its investments in cables, wires, satellites etc. by moving more services (mobile, internet, TV) through its network.

Your ROIC must be higher than the cost of capital. That's why companies sometimes sell or discontinue a product line to free up capital for more effective uses.

KEY QUOTES

"Return is nothing more than profit margin multiplied by velocity. This is a universal law of business."

"Things must move through a business to the customer, and the faster the better."

4. Growth

Growth is essential for any individual or organization to thrive and prosper. A company that doesn't grow cannot stay ahead of its competitors, meet evolving market needs, or retain great talents.

- However, don't grow for the sake of growing. *Bad growth* can actually hurt a company. This includes: cutting prices to gain market share, borrowing aggressively to invest in non-profitable products, or using mergers and acquisitions to boost financial figures without addressing the business basics. If your cash or profits are declining despite a growth in sales, stop to examine what's going on.

- The key is to focus on *good growth* that improves both your top line (revenue) and bottom line (profit), and meets 4 criteria:

  (i) It's *profitable* and capital-efficient, i.e. it brings higher returns than investing in a safe financial instrument (e.g. a Treasury bill).

  (ii) It's *organic* and builds on what the company is already doing.

  (iii) It's *differentiated* from competitors.

  (iv) It's *sustainable*, i.e. you can keep growing year after year.

Use the growth box to find good growth opportunities. Ask 4 sets of questions:

	EXISTING CUSTOMERS	NEW CUSTOMERS
EXISTING NEEDS	How to better serve our customers with current core competencies?	Can we sell what we have to new customers?
NEW NEEDS	What new needs can we satisfy for existing customers?	Should we pursue new customers with new needs?

- How can you better serve *existing needs of existing customers*? This is about leveraging your core competencies to expand the current pond you're fishing in. For example, home

KEY QUOTES

"Either you are growing or you are dying."

"Don't use size as a measure of success."

"Growth energizes a business. A company that is expanding attracts talented people with fresh ideas. It stretches them and creates new opportunities."

improvement chain Home Depot linked customers to contractors to install their purchases.

- How can you satisfy *new needs for existing customers*? These are problems that're not addressed by you or your rivals, e.g. Toyota created Lexus to cater to customers who wanted something in between a Cadillac and a Mercedes.

- Can you address *existing needs for new customers*? This is about selling what you have to new customer segments, like how Avon extended its ladies' beauty products to teenagers.

- Should you try to fulfill *new needs for new customers*? It may make sense to enter a new business if your existing business or strategy is becoming obsolete, e.g. Nokia shifted from cellphones to networking equipment and software.

Putting It Together: Understanding the Whole Business

Business acumen is about understanding all 4 building blocks and combining them to see the full picture of how an organization is doing.

Start by examining 6 areas: sales, gross margin, net profit margin, inventory velocity, ROIC, cash generation and market share.

- The information can be found in a company's *annual report*.

  (i) The *Profit-and-Loss (P&L)* statement summarizes the company's revenues (sales) and costs (expenses).

  (ii) The *Balance Sheet* summarizes the company's assets, liabilities, and shareholders' equity. Shareholder Equity = Assets – Liabilities.

  (iii) The *Cash Flow Statement* shows the cash flowing in and out of the company (cash generation).

- If you work for a *public company*, speak with the investor relations department for a copy of the annual report. If you work for a *private company*, speak with your management or finance department. For each of the 6 areas, try to *answer these questions*:

KEY QUOTES

"A true businessperson masters the relationships among customers, cash generation, return on invested capital, and growth to get an intuitive grasp of the total business."

"If you and your company are going to succeed, you need to truly understand the business."

(i) Are the numbers increasing, flat or decreasing? Why?

(ii) How is your company doing compared to its competitors?

(iii) What's likely to happen in the coming months or years?

- If you can answer these questions, then you're *speaking the universal language of business*, to identify (i) if a company is doing well and (ii) which areas may require attention.

Charan used Amazon's annual reports from 2013-2017 to explain how their financial numbers showed a healthy business focus.

- The P&L statement showed *revenue* growing from $74mil in 2013 to $166mil in 2017, and *gross margin* rising steadily from 27% to 39%. This is a positive sign of their effort to increase customer value and add higher-margin products (e.g. Amazon Prime).

- A good company invests in things that improve its competitiveness and increase value for the customers and organization, and Amazon was investing heavily in technology and marketing. Between 2013 and 2017, tech/content *expenses* increased from $7mil to $23mil, while marketing expenses grew from $3mil to $10mil. However, general and administrative expenses only grew from $1mil to $3mil, which meant that they were also carefully managing their corporate overheads.

- Amazon's *profits* were relatively low, but there was no cause for concern since (i) this was partially due to investment in top talents and technology, and (ii) its Balance Sheet showed a steady growth in *shareholders' equity* (i.e. assets > liabilities). The *accounts receivable* was also much lower than accounts payable, since they were being paid by customers immediately and negotiating good payment terms with suppliers.

KEY QUOTES

"Use the universal laws of business, as they set the path and select the right priorities, so the organization can grow profitably."

Applying Business Acumen in the Real World

Cutting Through Real-World Complexities

Every organization faces a range of issues from strategy to finance, human resource and operations. Global companies like General Motors or Proctor & Gamble have to grapple with even more complexities since they have multiple product lines and geographical markets.

The best CEOs cut through the clutter to focus on just 3-4 priorities that will bring the business where they want it to go. They devote their time, energy and organizational resources to these priorities instead of diluting them over too many things. They also consider how these priorities will affect the 4 moneymaking fundamentals.

Generating Wealth

All public and private companies are expected to create wealth for their shareholders (including employees who own company stocks). The price-earnings ratio ("P/E" for short) is one of the best indicators of wealth creation. A P/E of 10 means that for every dollar of earnings per share, the stock is worth 10x as much.

$$\text{Price-Earnings Ratio (P/E)} = \frac{\text{Price of 1 share (P)}}{\text{Earnings of 1 share (E)}}$$

- In public companies, P/E is determined by analysts and investors. It reflects *market expectations* of the company's ability to make money, based on its past performance compared to competitors (or benchmarked against the S&P 500 index).

- A company is rewarded with a higher P/E multiple when it *delivers expected results consistently*, i.e. it predictably increases its revenue and profits without reducing velocity. If it fails to meet expectations, the stock price and P/E start to drop. After a series of misses, the P/E and stock price can fall so much that it's subject to acquisition by other companies.

KEY QUOTES

"Keep business basics in mind to cut through complexity and set the right path and priorities."

"The world has complexity but leaders provide clarity."

"Your company's price/earnings ratio is the key for turning money into wealth."

- Companies with a *higher P/E multiple* generate wealth for their shareholders, attract top talent, create job security and opportunities for employees to learn, grow and earn more.

Know your company's P/E multiple and how it compares with competitors and the S&P 500. The company is doing well if it has consistent, predictable and profitable growth, sustainable ways to generate cash, good ROIC, and is performing better than competitors.

- In a digital era, there are countless opportunities for traditional businesses to move into new areas of growth. Benchmark against companies outside your industry to *challenge your assumptions* on the possible rates of growth and profitability.

Developing an Edge Through Superior Execution

Knowledge alone isn't enough; you must also execute better than others. In the book *Execution: The Discipline of Getting Things Done*, Charan explained these essentials for execution:

- Be *crystal clear* on what you want to achieve.
- Break down the goals into *specific steps* (e.g. "Complete A in 1 week and B in 1 month") and *milestones* (e.g. "We know we're at the halfway mark when we get to X"). Ask for help if necessary.
- Consistently monitor progress and *follow through*.

Flawless execution helps to expand your organization's capacity. This requires that you:

- *Put the right people in the right roles*. The right person is someone who can thrive in the role, make sound decisions, deliver great results, and keep increasing his/her capacity.
  - (i) Maximize individuals' impact by matching each person's *strengths* (attitudes, aptitudes and skills) with what the business needs.
  - (ii) Regularly review the *job-person fit* as the business evolves.
- *Coach people* to expand their capacity and leadership skills.

KEY QUOTES

"Every time we raise value for a shareholder, we raise value for our people."
—Howard Schultz, Former Starbucks CEO

"Stop looking in the rearview mirror and imagine what will happen in the future."

"Leaders have to deliver results day in, day out, relentlessly and consistently. Delivering results is what gives an organization energy, builds confidence, and generates resources to go forward."

"Every business needs the right people in the right jobs."

(i) Treat every incident as an opportunity for coaching, and give honest, direct and constructive *feedback*.

(ii) Coach for *behavior* (e.g. listening well or finishing work on time) as well as *business aspects* (e.g. setting the right priorities and executing well).

(iii) If your company doesn't have a mentoring/coaching program, request for one or proactively approach someone who can help you to grow.

- If someone is wrong for the job or becomes mismatched as circumstances change, take *corrective action* asap.

Synchronize people's efforts so they move in sync toward a common goal and with minimum friction. This expands the company's capacity.

- As an organization grows, people must be organized into departments and roles. The larger the company, the harder it is to *share information and agree on priorities*. People may also hide their concerns or disagreements, leading to "false decisions" where people seem to agree yet fail to follow through.

- Identify the areas where it's critical to have information-sharing or joint decision-making, then design the effective *social operating mechanisms* with 4 characteristics:

(i) *Openness*: Make it safe to challenge status quo and discuss new ideas.

(ii) *Candor*: Be willing to share opinions honestly, speak up against consensus or highlight broken promises.

(iii) *Informality*: Be spontaneous, not formal or rigid.

(iv) *Closure*: After each dialogue, clarify decisions and expectations (including accountabilities and deadlines).

Getting Started

Start shifting your perspectives to think like a businessperson. This means (i) having a big picture of your company and the 4 moneymaking fundamentals, and (ii) linking it to your own priorities.

KEY QUOTES

"Synchronization expands the organization's capacity."

"Today, you have to be not only a team player, in the truest sense of the word, but you have to be an integrator as well."

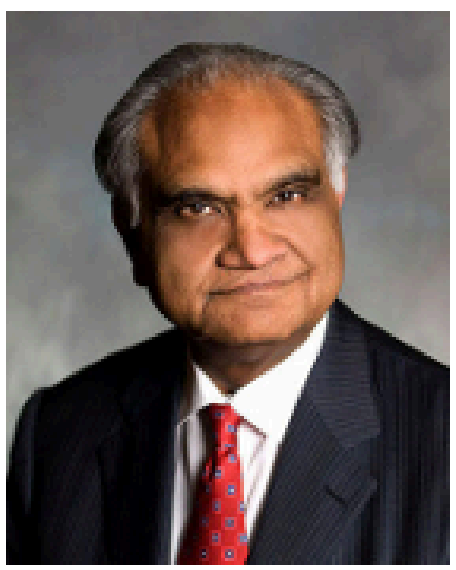
- *Know where your company stands* by looking into the 6 areas explained earlier: sales, gross margin, net profit margin, inventory velocity, ROIC, cash generation and market share.
- List down all the factors that affects your company's moneymaking ability (e.g. industry consolidation, innovation, currency fluctuations). Then, narrow down to *3-4 simple, actionable priorities* for your department or role. For example, if you're in HR, you can help to break silos, connect people or put the right people in the right roles. If you're in Finance, you can identify ways to add capacity, improve margins, or use cash more optimally.
- Help the people you work with to *expand their capacity and synchronization*.

Other Details in the Book to Look out For

This is a clear and easy-to-read book. Charan illustrated the key ideas in this summary using detailed examples and case studies of companies such as Netflix, Starbucks, Ford, Amazon, etc. For more details, please visit https://ram-charan.com/.

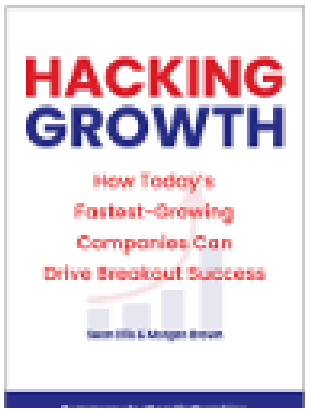
About the Author

Ram Charan (born 1939) is an Indian American business consultant, speaker, and author. He was formerly a Harvard Business School professor, and has consulted with leading companies like GE, Bank of America, Verizon, Coca-Cola, 3M, Merck, Aditya Birla Group and Tata Group. He has authored and co-authored several books on business strategy, execution, corporate boards and building a high performance organization.



KEY QUOTES

"If you can show your customers that your product will create more value for them, you will make more sales. And if you show your own company that you understand what will provide more value for it, you will be promoted."



HACKING GROWTH

How Today's Fasting Growing Companies Can Drive Breakout Success

SEAN ELLIS & MORGAN BROWN

The Big "So What"

How can you acquire new customers, keep them engaged, convert them to paying customers/ambassadors, and leverage technology to grow your revenue with a shoestring budget? This book presents the growth hacking method: using rigorous analyses and rapid tests to identify, test and implement high-impact growth opportunities. It can be used by any company (big or small) and for any function (e.g. marketing or engineering).

Introduction

In the 2000s, Sean Ellis started testing unconventional approaches to help various companies to grow rapidly given a limited budget and tough competition. These techniques and processes were gradually expanded and refined to become the growth hacking model presented in this book.

- For example, Dropbox grew from 100,000 to 4 million users in 14 months without any traditional marketing. Instead, it offered 250MB of free storage to each user who referred a friend to try Dropbox. Airbnb struggled until it cross-published with Craigslist to redirect searches for short-term vacation rentals to the Airbnb booking website.

- Growth hacking provides a rigorous method for rapid, cross-functional experimentation. Today, many leading firms—such as LinkedIn, Facebook, Quora, Tesla, Adobe and Airbnb—all use growth hacking as a key engine of growth instead of relying on costly advertising campaigns.

KEY QUOTES

"Growth hacking is so much more than a business strategy, or even an ongoing process. It's a philosophy, a way of thinking, and it's one that can be adopted in any team or company, big or small."

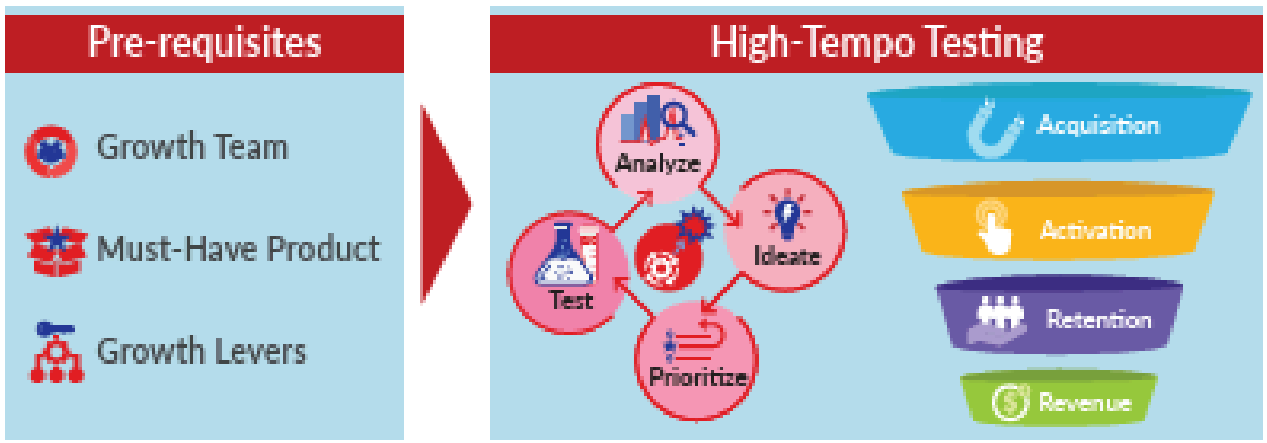
"Growth hacking isn't just about how to get new customers. It's about how to engage, activate, and win them over so they keep coming back for more."

"Growth hacking empowers companies to achieve breakout growth without pouring money into outdated and horribly expensive marketing campaigns of questionable business value."

In this summary, we'll explain growth hacking in 2 parts: an overview of growth hacking followed by a playbook for execution.

Part 1: An Overview of Growth Hacking

Here's an overview of the key components involved in growth hacking:



The Pre-Requisites

There're 3 pre-requisites that must be in place before you're ready to drive growth via high-tempo testing.

A growth team optimizes results by bridging the silos found in most organizations. Growth teams complement rather than replace traditional functions, and can range from 4-5 people to more than 100.

- The key is to have *cross-functional expertise* including business strategy/goals, marketing, data analysis and product development. Key roles include:

  (i) A *growth lead* who sets defines the experiments' goals, pace and metrics;

  (ii) A *product manager* who oversees the delivery of the desired product features;

  (iii) *Software engineers* who write the code for the required tests and product changes;

  (iv) *Marketing specialists* with the relevant expertise (e.g. social media, email marketing);

KEY QUOTES

"Start-ups and established companies alike...simply can't afford to be slowed down by organizational silos."

"Growth cannot be a side project."

(v) *Data analysts* who can collect, integrate and analyze data from multiple sources; and

(vi) *Product designers* who specialize in the relevant products.

- In startups and SMEs, team members often wear multiple hats. As the company grows, the growth team's size and composition will *evolve*. For example, LinkedIn's growth team grew from 15 people to more than 120 members spread over 5 units focusing on network growth, search engine optimization/marketing, onboarding, international growth, and user engagement.

- You can bring in external specialists to strengthen key capabilities, but the *responsibility for growth* must always rest with the top management, e.g. the founder/CEO or a senior executive. Typically, the reporting structure will follow (i) a *product-led model* where the team focuses on improving specific aspect(s) of a product's performance, or (ii) a *stand-alone* team reporting to a VP of Growth.

Don't start rapid growth experimentation until you have a must-have product, i.e. you know its *core value*, to *whom* it's a must-have, and *why*. Pushing for growth prematurely can be costly or even fatal since (i) you'll waste resources promoting something that no one wants and (ii) you'll end up generating critics instead of fans.

- Every wildly-successful product has an "*aha moment*": when a user experiences the core value or benefit of the product, finds it irresistible and becomes a fan. Yelp's aha moment is when users discover local restaurants or businesses via trusted community reviews. Facebook's moment is when users see instant updates and photos that show what their friends/family are doing.

- To assess if you have an aha experience, use these *2 tests*:

(i) The *must-have survey*. Ask users "How disappointed would you be if this product no longer existed tomorrow?", with responses on a 4-point scale (very disappointed, not disappointed, and N/A—I no longer user it). The goal is to have ≥40% users respond with "very disappointed".

KEY QUOTES

"It's vital not to outsource the core responsibility for growth…growth is too important to delegate."

"While creating a must-have product alone is not sufficient for breakout success, it is the baseline requirement for rapid and sustainable growth."

(ii) Whether your *retention rate* is higher than your competitors and stable over time.

- If your product passes both tests, it's ready for growth hacking. If not, you must first *address the gap(s)* using all 3 methods below:

  (i) Do additional customer *surveys/interviews* and/or observe how customers use your product.

  (ii) Run *efficient experiments* (minimum viable tests) for product/message changes across the entire funnel, such as A/B tests to compare 2 options or multivariate tests to compare all possible combinations of a component.

  (iii) Do a *deep analysis* of your user data. Consider creating a data warehouse to store all customer info, so you can identify the complete path for each group of users, exactly how an active user spends time on your website (compared with someone who doesn't), and when/why someone leaves the funnel.

- Be open to *unexpected discoveries* which may lead to a shift or pivot in your business focus. Instagram (originally called Burbn) dropped its confusing host of features after analyses showed that users only used 1 feature—photos. YouTube (originally a video dating site) made a pivot after analyses showed that users were uploading all types of videos, not just those for dating.

Once you know your aha moment, your goal is to get as many users to experience it as quickly as possible. However, you won't create a big-enough impact by testing lots of small changes (e.g. different button colors). You need to focus on high-impact, high-potential tests, i.e. you must identify the right growth levers and have a proper growth strategy.

- Start by figuring out your *growth equation*, which summarizes the key factors that drive your growth. Such equations will vary for different products/businesses, e.g. :

  (i) A news site with a subscription model: Subscriber revenue growth = Website traffic × Email conversion rate × Active user rate × Conversion to paid subscriber + Retained subscribers + Resurrected subscribers.

KEY QUOTES

"The key mission at this stage is to look for the behaviors that differentiate those customers who find your product must-have—that is, those who use or buy repeatedly—from those who don't."

"Growth hacking is not about throwing ideas against the wall as fast as you can to see what sticks, it's about applying rapid experimentation to find and then optimize the most promising areas of opportunity."

"Reducing the complexity of your business operations down to a basic formula is immensely helpful in allowing the growth team to focus on the right signals in this vast sea of data noise."

(ii) An ecommerce site: Gross merchandise volume growth = Number of sellers listing items × Number of listed items × Number of buyers × Number of successful transactions.

- Essential metrics are those that correlate most directly with your aha moment. Narrow down to 1 key metric that'll ultimately drive your growth—this is your "*North Star*" or the metric that best captures the core value for customers. eBay's North Star is the number of items listed for sale, while LinkedIn's is the number of people who have filled in their work profiles.

  (i) North Stars help to *direct your focus*. To improve the number of nights booked (Airbnb's North Star), the team zoomed in on New York City as an under performing market. They found that the quality of photos there were poorer than usual, and a test proved that postings with better photos got 2-3x more bookings. This led to initiatives to help hosts to improve their photo quality, improving global booking rates by 2.5x.

  (ii) North Stars may *evolve* as your company grows. A company can have 1 North Star yet have various growth teams focusing on different metrics, like how LinkedIn focuses on 5 areas of growth despite having 1 overarching North Star.

- *To make the most of your data and analysis*:

  (i) Use a mix of *quantitative analysis and qualitative probing* to figure out why certain trends or gaps exist.

  (ii) Make the North Star and key data/metrics *accessible* to the whole company. Use charts, visuals and ratios to present the key metrics at a glance, and show how you're performing relative to specific goals or benchmarks.

High Tempo Testing

Once the pre-requisites are in place, you're ready to start the growth hacking process. This comprises 4 key steps—analysis, ideation, prioritization and testing—that run in a continuous cycle.

KEY QUOTES

"You want to track, at a minimum, the metrics for each of the steps users must take to reach the aha moment and how often they are taking those steps."

"The companies that grow the fastest are the ones that learn the fastest."

You'll need to run lots of experiments because not all of them will yield significant or conclusive results.

- Small insights and successes add up. A 5% improvement in conversion rate each month will compound into an 80% improvement in a year. The faster you *test and learn*, the faster you'll grow.

- *Start slow and gradually ramp up*. Small teams can start with 1-2 tests per week, while larger teams can go up to 20-30 tests per week.

Kick off the process with a team meeting to define each person's role, and explain the growth hacking principles and processes. Then, adopt this 4-step process in a systematic and disciplined fashion:

- *Analyze: gather data and insights*. At this phase, the growth lead typically works with the data analysts to address questions such as: how do your best customers behave (e.g. shopping and usage patterns), what are their characteristics (e.g. source of acquisition and profile), and what causes users to drop off (e.g. pages with high exit-rates or bugs). The marketing specialists may concurrently conduct user surveys and interviews. The initial data and analyses are compiled and shared with the team in advance, to facilitate discussion at the next team meeting.

- *Ideate: generate ideas*. After the meeting, every member should take 4 days to submit as many ideas as possible in a templated format which includes:

  (i) The *idea name* (<50 characters) and *description* of the idea to be tested (including who, what, where, when, why and how).

  (ii) The *hypothesis* of the expected cause-and-effect, e.g. "By making it easy for shoppers to view and reorder previously purchased items, we can increase repeat purchase by 20%."

  (iii) The *metrics* to be tracked. Use multiple metrics since improvements in 1 area may come at the expense of others.

KEY QUOTES

"Generally, big successes in growth hacking come from a series of small wins, compounded over time."

"You cannot know ahead of time which experiments are going to be most effective. The best you can do is stay nimble and data-driven."

"Ideas are the rocket fuel of growth. And you need a pipeline of them delivering a steady flow."

"The more ideas that go into your pipeline the better your chances of finding winners that spur growth."

You can also get ideas from people outside the team (e.g. customers or suppliers) by sharing your growth levers and target metrics with them.

- *Prioritize what to experiment*. Each idea must come with a score to help the team prioritize what to do.

  (i) You can use the *ICE score* to rate 3 items: (a) *Impact* (how far the idea is expected to improve the key metric), (b) *Confidence* (how strongly the ideator believes the expected impact can be delivered), and (iii) *Ease* (the amount of time/resources needed to run the test). Use a 10-point scale for each component, then calculate the average score.

  (ii) The ratings needn't be perfect—they're just a tool to facilitate *debate and decisions*. The growth lead can review the ideas and suggest improvements prior to each meeting, or get the team to nominate the top ideas they wish to discuss so only the "finalists" are debated at the meetings.

  (iii) After you've shortlisted the experiments, focus on those that can be done in 1 week, and put the rest in the *experiment pipeline* (with an assigned timeline).

- *Test: run the experiments*. The selected tests for the week are moved up the work list, with 1 member in charge of each test.

  (i) Members must collaborate with other colleagues to implement the tests, while the growth lead helps to remove obstacles.

  (ii) Use these *2 rules of thumb* to ensure the results are statistically valid: (a) Use a 99% statistical confidence level so you only get 1 false-positive out of 100 samples, and (b) if there's a tie or inconclusive results, stick to the original/control version.

- *The cycle is repeated* when you review/analyze the results to decide on the next steps.

  (i) *Summarize the test results* including the name/ description, type of test, features impacted, key

KEY QUOTES

metrics, start/end date, hypothesis and results, other variables that may have affected the results, and your conclusions.

(ii) These should be shared and put into a knowledge database for future reference. *Communicate* the results (e.g. sending a "wins" email, creating a group chat or publishing test results on the company dashboards).

The authors recommend holding your growth meetings weekly (or bi-weekly). Any brainstorming and preparation should be done prior, so each meeting can focus on reviewing the previous weeks' results and setting priorities for the next week.

- Here are how GrowthHackers' own meetings are run:

(i) Growth meetings are held every Tuesday so people can finish their preparation on Monday.

(ii) The growth lead is responsible for sending the compiled data/updates and agenda in advance, and for running the meeting effectively within 1 hour.

SAMPLE MEETING AGENDA	
15 min	Review metrics, highlight key positives vs negatives, and update the focus area
10 min	Review last week's test activity (including tempo, # tests and reasons if any tests weren't done as planned)
15 min	Share key lessons learned (e.g. experiment outcomes, Q&A, team's conclusions on next steps)
15 min	Select the next set of growth tests (for the coming week)
5 min	Check the idea pipeline to ensure there's a healthy pool of fresh ideas being added

Part 2: The Growth Hacking Playbook

In this section, we'll break down how you can implement high-tempo testing across the entire sales and marketing funnel: acquisition, activation, retention and revenue.

KEY QUOTES

Hacks for Acquiring Users/Customers

A must-have product means you've already achieved Product-Market Fit, i.e. you have a compelling product for your target market. To start acquiring new customers rapidly, you must achieve 2 additional types of fit and create viral customer loops.

Language-Market Fit is about describing your product in a way that resonates with your target audience. People's online attention span is extremely short and you only have 8 seconds to convey how your product will improve their life.

- When iPod was launched in 2001, it succinctly conveyed its aha experience with 5 words: "1000 Songs in Your Pocket". To find good words/phrases, try *using your customers' language*: talk to your customers and examine the words they use to review, share or describe your product.

- Small word changes can have a huge impact, and can be tested with *A/B tests*. Tickle's growth skyrocketed after it changed just 1 word from "Store your photos online" to "Share your photos online". A dating app saw a jump in growth when they switched from "Find a Date" to "Help People Find a Date".

- Changes in wording can also affect your *brand and product focus*. For example, P&G launched Febreze with the words "cleans bad smells out of fabrics for good". After observing how avid buyers used Febreze, they added scent and changed the words to "for freshness that surrounds you like never before".

Channel-Product Fit is about selecting the most effective marketing channels for your target audience. It's better to optimize a few top channels than to spread your resources too thinly across many channels. This involves 2 parts:

- *Discovery*: Explore channels across *3 key categories*: viral/word-of-mouth (e.g. social media, games), organic (e.g. search engine optimization, email marketing), and paid (e.g. offline or online ads). Consider channels that're the *most appropriate* for your business model and your

KEY QUOTES

"As you plan your first hacks to test, start with language, and then go from there."

users' characteristics (e.g. the types of words they search for, where they shop, the social networks they use). Once you have specific ideas to improve acquisition, *score/prioritize* which ones to test first. You can score each idea against these 6 factors (on a scale of 1-10), then calculate the average score:

(i) Expected *cost* of running the experiment

(ii) Ease of *targeting* or reaching your intended audience

(iii) How much *control* you have over the experiment (e.g. if you can easily adjust or stop it halfway)

(iv) How much *input time* is needed to launch the experiment

(v) How much *output time* is needed to extract the results

(vi) What *scale* of audience can you reach with the experiment.

- *Optimization*: As the team starts to run the experiments, some options will stand out and new ideas will surface. Keep refining the channels that work and eliminating those that don't.

🔁 Design customer loops. Virality can come from word-of-mouth or be built into your product (instrumental virality).

- *Virality = Payload × Conversion Rate × Frequency*, where (i) payload is the number of people to whom a user will send an invite (e.g. a link/widget) each time, (ii) conversion rate reflects the response rate to the invite, and (iii) frequency is how often people are exposed to the invites.

- Here are some *useful tips* for creating successful viral loops:

  (i) Consider possible *network effects*, i.e. the users' product experience will improve if they bring in other users (e.g. social networks like Facebook or LinkedIn).

  (ii) Offer an *incentive* that's aligned with your product's core value, e.g. Airbnb giving $25 toward your next stay.

KEY QUOTES

"If they don't love it, they're not going to share it. Virality is a balance of how good the packaging is and how good the content is."
—Eli Pariser

"While finding the right words to appeal to people is vital, offering true value is a necessary ingredient for achieving viral growth."

(iii) *Integrate the invitation* into the user experience, e.g. once you join LinkedIn, you're instantly prompted to view your connections and import your contacts.

(iv) Ensure the invitees have a *good experience*, e.g. Airbnb includes the name and picture of the person who invited you, with a personal message and a call-to-action to claim your free credit.

(v) *Keep experimenting* to create a great referral program. After rounds of testing, LinkedIn discovered that the optimal number of invites for their service was 4 (2 invites were too few and 6 were too many).

Hacks for Activating Users/Customers

Having attracted your potential customers, you must now activate them, i.e. get them to use your product.

Use these 3 steps to activate customers effectively:

- *Step 1: Map out the steps* that users must take to get to the aha moment, then calculate the conversion rate for reach step. Consider the channels that brought the customers to you and their journey after they found you.

- *Step 2: Create a funnel report* to show the conversion rates for each step (and how they differ across user segments). Look for the areas with the highest drop-offs, and consider differences between active users, activated users who went cold, and those who were never activated. For example, HubSpot found that users who signed up with their work emails were more active for their new product (compared to those with a personal email), so they started asking for users' work email in the sign-up form.

- *Step 3: Conduct surveys/interviews* to understand why people are dropping off at certain points, then test high-impact ideas based on those insights. Never rely on your own assumptions.

  (i) To avoid irritating users, keep your surveys brief to ideally 1-2 questions. Focus on 2 situations: (a) when they seem confused (e.g. they stay too long on a page

KEY QUOTES

"Improving activation is at its core about increasing the rate at which you get new users to your aha moment. The more visitors who experience what makes your product a musthave, the more of them will stick with you."

"Always remember that there are no silver bullets in growth hacking, and that even what seem like slam-dunk ideas can fail."

or are about to leave the website), or (b) just after they've finished a step that others don't take (e.g. make a purchase). For instance, you can ask why someone didn't complete an order, or what convinced them to complete an order.

(ii) You should also test your mini questionnaires to improve engagement (e.g. the choice of words, images and visuals).

Removing common obstacles to activation. Make sure that the landing page for new users (i) conveys relevance, (ii) shows the value of the product, and (iii) has a clear call to action (CTA).

- Explore *hacks* like allowing users to register with a single click, or letting them enjoy your product before they sign up. You can also improve engagement via questionnaires or gamification.

- *Triggers* (e.g. website CTA buttons, emails or push notifications) are commonly used to improve activation. You can experiment with notification triggers for account creation, purchase, reactivation, new features launches, top user incentives, etc.

(i) As a *rule of thumb*, you should only get in touch with users when there's an opportunity of real value to them.

(ii) When crafting triggers, try to incorporate Robert Cialdini's *6 persuasion principles*: reciprocity (e.g. give a freebie for signup), authority (e.g. use endorsements from influential people/firms), social proof (e.g. show a large number of users), liking (e.g. use referrals from friends), scarcity (e.g. limit the number of freemiums), and commitment and consistency (e.g. break it down into a series of tiny steps).

Hacks for Retaining Users/Customers

When you retain customers, you can get more repeat purchases (without the corresponding acquisition costs), have more opportunities to understand them and improve your product,

KEY QUOTES

"While we certainly notice the friction in the products we use, we often don't recognize sources of friction in the ones we've been involved in creating or marketing."

"Creating positive friction is a delicate art of putting manageable, ideally engaging steps in the path of visitors that help them understand what the value is and get to the aha moment with greater predictability."

"The longer you retain customers, the more opportunity you have to earn more revenue from them."

and get additional word-of-mouth referrals. A study found that a 5% increase in customer retention rates can improve profits by 25-95%.

A healthy retention rate varies with each product/business, but you can study similar products/services to decide on your metrics. Ideally, you should see a *growing retention rate* over time, like how Instagram becomes more valuable with time as people post more photos and follow more people. You should also do *cohort analyses* to examine why some groups of users are staying longer than others.

Retention can be broken down into 3 phases:

- *Initial retention* is the period when a new user either decides to keep using the product/service or goes dormant. This window varies for different products. Your goal is to identify the minimum level of activity required (e.g. they must return ≥3x in 2 weeks to stay engaged) and focus on getting users to that tipping point. Retention hacks are similar to activation hacks, i.e. you want to get users to the aha moment asap.

- *Medium-term retention* kicks in when the initial novelty fades. Your goal is to help users to form habits so your product is incorporated into their daily routine. According to Nir Eyal, you can design a habit-forming loop in 4 parts: by using a *trigger* to lead to an *action*, which brings a *reward*, which leads to an even greater *investment* by the customer. Focus on testing different rewards to see what works best for different cohorts, e.g.

  (i) *Brand ambassador programs* with a blend of social rewards (e.g. social "likes" or elite status) and tangible ones (e.g. discount tiers or credits).

  (ii) *Recognizing achievements*, e.g. when a customer passes a certain milestone or takes certain actions.

  (iii) *Personalization*, e.g. customizing your email communications and product recommendations.

  (iv) More value "*coming soon*" (e.g. upcoming features or offerings).

KEY QUOTES

"One general rule that holds true across most product types is that improving the perceived value of the rewards leads to greater retention."

- *Long-term retention* requires product improvement—by enhancing existing features and adding new ones. Remember to continually educate your customers about the value they can get, to renew their perception of your product as a must-have.

Resurrection: To win back users who've abandoned your product, you must find out why they left in the first place. When a customer's purchases or activity drops to zero after a designated time period, the team should experiment with resurrection flows (e.g. sending emails or targeted ads) to win them back.

Hacks for Monetizing Users

Ultimately, your goal is to earn more revenue from each customer over time, i.e. to increase your customers lifetime value (LTV).

Refer to the customer journey map to identify *all* the opportunities for monetization from acquisition to retention.

Next, analyze (i) which parts of the customer journey generate the most money, and (ii) where are the pinch points where potential revenue is being lost.

- Once again, compare different *cohorts*, e.g. slice the data by location, gender, age, items purchased, features used, webpage engagement etc. For products sold internationally, you should also consider different payment norms or fees for each country.

- It's useful to develop customer *personas* for groups of customers with similar characteristics, needs and wants. You can run experiments for each persona, get targeted feedback via surveys, or send personalized product recommendations or offers.

- One of the hardest areas to optimize is your *pricing*, which is set based on certain value metrics. Consider if your value metric (i) is aligned with perceived customer value, (ii) scales with product usage and (iii) is easy to understand. Since pricing is closely related to perceived value, lower prices don't always increase sales volume

KEY QUOTES

"Lower prices do often lead to a higher volume of sales—but not necessarily. In some cases, lowering the price can actually hurt sales or at least fail to provide the boost in demand hoped for."

or revenue. The only way to optimize pricing is through continual and careful experimentation.

- You can also apply Cialdini's *6 persuasion principles* to optimize monetization. The key is to use data to measure what works, what customers will pay for, and experiment how best to meet those needs and maximize LTV.

Conclusion and Other Details in the Book

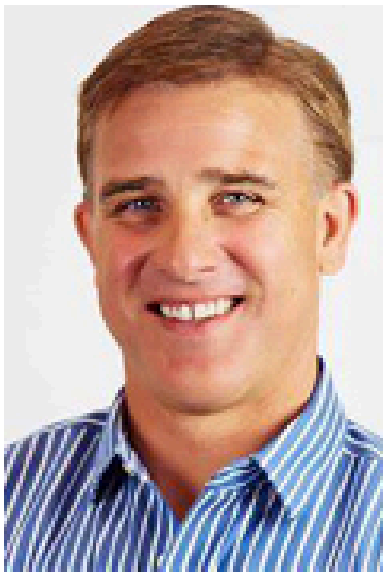
Ultimately, every product and business is different. The only way to uncover the best growth opportunities and hacks is to keep experimenting.

- When a growth team hits upon a *winning idea*, invest to get the most from it (including opportunities for cross-fertilization) instead of simply moving on to new areas.
- The job of growing a business is never finished. Prevent complacency by using growth teams to drive continual data-driven innovation and create a *virtuous cycle of growth*.

This is a detailed guidebook that takes you through the process of hacking growth step-by-step, including specific guidelines, case studies, sample questions and tips to help you grasp the concepts and tailor them to your specific product or business model. For more details and resources, please visit https://growthhackers.com.

About the Authors

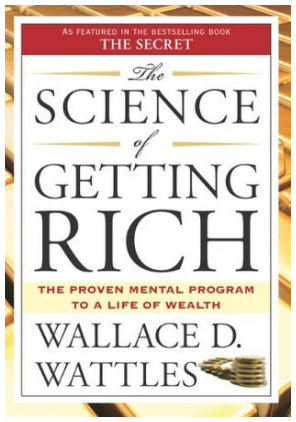
Sean Ellis is an entrepreneur, investor, and startup advisor. He is the CEO of Growth Hackers and was previously founder and CEO of Qualaroo. Ellis graduated from the University of California. He was the head of marketing at LogMeIn and Uproar, and was the first marketer at Dropbox, Lookout and Xobni. He is an advisor to KISSmetrics and Eventbrite, a mentor at 500 Startups, a Board Member for Mavenlink and SignNow, and an investor in Bitium. For more details, visit www.seanellis.me.



KEY QUOTES

"Doubling down is a powerful way to stack one growth win on top of another."

"Driving growth is a job that is never truly done. The breakout companies that sustain their success are those who constantly push for more, leveraging their success, capitalizing on new opportunities, and creating a virtuous cycle of growth."



THE SCIENCE OF GETTING RICH

The Proven Mental Program to a Life of Wealth

Wallace D. Wattles

The Big "So What"

First published in 1910, this was one of the earliest self-help books that explained how to acquire wealth in a scientific way based on metaphysical concepts. Wattles promises that if you truly grasp the ideas in this book and apply them like a scientific formula, it will be the only book on getting rich that you'll ever need to read.

Introduction

This book is based on Wattles' study of philosophers like Descartes, Spinoza, Leibniz, Schopenhauer, Hegel and Emerson. Wattles focuses only on the practical insights you'd need to get rich, without going into detail on how metaphysics works. He urges that you take the facts presented in the book as true. If you wish to do further research on your own, he recommends the works by Hegel and Emerson.

Defining wealth. Richness in this book refers to having *everything* you can possible want in life.

- *Being successful involves much more than money*. It's about being who you want to be and living to your full potential, which also includes contribution, fulfillment, appreciation of beauty etc.

- *However, it is important to have money*. Our society is structured such that we need money to buy, use and organize things. When you have lots of money and can put it to good use, you can multiply your growth and impact.

Getting rich is a science. According to Wattles, getting rich is an exact science. It works like a set of algorithms, much like

KEY QUOTES

"Getting rich is the result of doing things in a Certain Way...any man or woman who can do things in that way can become rich."

"The man who owns all he wants for the living of all the life he is capable of living is rich."

"In order to know more, do more, and be more we must have more."

"Wherever there is unexpressed possibility, or function not performed, there is unsatisfied desire."

the mathematical laws of addition and subtraction. *By applying the science in this book, anyone can get rich.*

- Your *ability to become rich* does not depend on your environment, talent, ability to save money, nor your choice of business or profession. Two people with similar circumstances or talent can end up with vastly different levels of wealth.

- Instead, it depends solely on whether you think and act in accordance with *the laws of getting rich*. To test if this law is real, you need to apply it yourself.

The book is presented in 17 short chapters. In this summary, we've organized the key ideas into 3 key parts: Establishing the Truths, Thinking in the Certain Way and Acting in the Certain Way.

Part 1: Embracing the Truths

The Science of Thinking Rich begins with you fully embracing several truths, so you can think and act in accordance with these truths to create massive wealth.

At the most fundamental level, **everything in this universe is made of the same "Original Substance".**

- It is *formless, supremely intelligent and permeates everything* around us—including organic and inorganic things and the spaces between them.

- It is behind the very creation of this universe; *it is everywhere, infused in and connected to everything*.

- Wattles uses many terms interchangeably to describe this substance, including "Formless Substance", "Thinking Substance" "Original Substance", "Supreme intelligence", "Living Presence" "God" and "Nature". For this summary, we'll refer to it mainly as *the Source*, and occasionally as Nature or God.

- The Source is *pro-life and pro-creation*. It flows naturally toward anything and anyone that supports life, creation and a fuller expression of life.

KEY QUOTES

"You can become what you want to be only by making use of things, and you can have the free use of things only as you become rich enough to buy them."

"The universe is a great Living Presence, always moving inherently toward more life and fuller functioning."

"It is the nature of intelligence to enlarge itself, and of consciousness to seek to extend its boundaries and find fuller expression."

Thoughts trigger the process of creation. Every thought leaves an impression in the Source, and triggers the process of giving form to that thought.

- If you think of a house, the form of the house is impressed upon the Source. It *automatically sets the wheels in motion* to create the house. This could be in the form of changes to the commerce or construction industries, or the formation of raw materials required to someday build that house.

- Such creation generally flows along *existing paths/lines of growth and action.*

- *The results are not instantaneous.* For example, the thought of an oak tree will immediately trigger the process of its creation, though it may take centuries for that tree to be fully formed.

Human beings are "thinking centers". Mankind can originate thought—when we imagine things, we form them in our minds and impress these thoughts on the Source. This triggers the process of creation.

- Every action you take, everything you create with your hands and every item that you see all originates from an *invisible thought.*

- The only way to create tangible wealth is to *begin with your thoughts.*

Part 2: Thinking in the Certain Way

We'll now take a closer look at how the Source works and how to think in the specific way that brings wealth to you.

Create, Don't Compete

Most people have the **wrong perspective about wealth.** They see it as a finite resource that's limited and/or controlled by certain people or institutions.

KEY QUOTES

"No thought of form can be impressed upon Original Substance without causing the creation of the form."

"Every form and process you see in nature is the visible expression of a thought in Original Substance."

"The Creative Power within us makes us into the image of that to which we give our attention."

"All the forms that man fashions with his hands must first exist in his thought; he cannot shape a thing until he has thought that thing."

"Nature is an inexhaustible storehouse of riches; the supply will never run short."

- Thus, they are *afraid to lose out* and fear that others will steal their riches or opportunities.

- They try to *get more at the expense of others*, competing or even taking advantage of others for their own gains.

In reality, **there is more than enough for everyone.**

- The Source is of *infinite supply* and can never be depleted. Thus, there is always more than enough riches for everyone.

- *No one can monopolize opportunity or wealth.* There are always opportunities around you, even though the *form* of such opportunities constantly evolves. If you follow the rules in this book, flow with the tide and capture available opportunities, no one can keep you down or withhold riches from you.

Abundance for all. Earlier, we explained that the Source is pro-life and pro-creation. It does *not* take something away from one party to give to another. Instead, it moves in a way that gives more life to *all*.

- *Do not* seek riches solely for *personal gratification* (i.e. for your own selfish enjoyment or interests), engage in *rivalry* (i.e. compete with others), nor *charity* (i.e. sacrifice yourself solely for the good of others).

- *Do* seek riches in a way that creates more for you *and* others. To do so, you must look beyond what's visible. Focus on creating with the Source, which will never run out and cannot be taken away from you.

You have the right to be rich. Remove all notions that money is bad or that God frowns upon.

- Paul said that "it is God that worketh in you to will and to do". The Source, God, Nature or the Universe (whichever term you relate to) wants you to be rich and have more. It wants you to *become the vessel* through which it channels creative energy.

- The key to creating wealth while *staying in harmony* with the Source is to benefit others as well as yourself.

KEY QUOTES

"There is abundance of opportunity for the man who will go with the tide, instead of trying to swim against it."

"No man is kept poor because opportunity has been taken away from him."

"Remember that extreme altruism is no better and no nobler than extreme selfishness; both are mistakes."

"You are to become a creator, not a competitor; you are going to get what you want, but in such a way that when you get it every other man will have more than he has now."

"Desire is possibility seeking expression, or function seeking performance."

The secret to creating value for all involved is to **give more to others in "use value" than what you take in "cash value".**

- For example, if you sell an Eskimo a famous piece of art (worth $2mil) for $200, you are not creating value, for he has no real use for it. However, if you sell him a gun or heater for the same amount, you are adding value. It's always possible to transact in a way that creates *more value for everyone involved.*

- The value of *knowledge* (like the ideas in this book) can be worth much more to the user than the cash value of the book. Likewise, you can set up your business to give your employees *opportunities* to grow and make much more money than just the cash salary you give them.

Faith and Gratitude

Once you've impressed your thought on the Source, have the faith that your request will definitely arrive. **Claim it as if it's already yours.**

There's no need to keep **worrying or talking** about your request or how it will be delivered. The Source is connected to all things, and knows the best way to make things happen in a way that benefits everyone involved. It may create certain events or bring certain people to you, all of which jointly deliver what you want.

What you must do is to think in harmony with the Source, have faith, and act in a Certain Way (which we'll cover in the next section). To **build your faith**, you can make progressively bigger requests, rebuilding your vision as you do so.

The **Law of Gratitude** says that action and reaction are always equal and move in opposite directions. When you offer gratitude in response to a gift, the forces of giving and receiving are in harmony.

- The *stronger your gratitude*, the stronger the reaction from the Source, and the faster good things come your way.

- It's common for people to cut off their connection with God or the Source once they get what they want. They fail to

KEY QUOTES

"Give every man more in use value than you take from him in cash value; then you are adding to the life of the world by every business transaction."

"You will not need to deal with (others) unfairly; you do not have to give something for nothing, but can give to every man more than you take from him."

"The answer to prayer is not according to your faith while you are talking, but according to your faith while you are working."

"To permit your mind to dwell upon the inferior is to become inferior and to surround yourself with inferior things."

acknowledge their gifts with gratitude, or even complain about what they've received. If you feel *discontented* or focus on your inadequacy, you impress these thoughts on the Source and bring them to you.

Gratitude and faith reinforce each other: when you are grateful, you expect more good things (faith), which brings them to you.

- *Develop the habit of being grateful* for every good thing (big or small) that comes to you.

- *Don't waste time and energy* feeling upset about what you lack, nor complain about others' inadequacies or mistakes.

Have a Clear, Consistent Mental Picture

In order for the Source to deliver what you want, you must first hold and transmit a **clear, precise mental picture** of it.

- It's not enough to have a *vague idea* that you want to "live better" or have "more money".

- Consider what exactly you want, and go over it in *great detail* to sharpen your mental picture. For example, crystallize every detail of your desired house, including its surrounding and furnishings.

Once you have a clear mental image of what you want, **hold it consistently in your mind.**

- Most people never get down to crystallizing what they want, or they get distracted easily by other things. To form and hold a clear, consistent image of something, you must have a *strong desire* for it.

- Formulate your vision in *vivid images*, not tons of words. Without clarity, no amount of contemplation, prayers, or affirmations will work.

- Create a *self-reinforcing cycle*: crystallize a definite mental picture of what you want, constantly replay the details and sensations so it strengthens your desire and makes it easier to hold the picture in your mind.

KEY QUOTES

"You can never get rich, or start the creative power into action, by sending out unformed longings and vague desires."

"Unless you really want to get rich, so that the desire is strong enough to hold your thoughts directed to the purpose as the magnetic pole holds the needle of the compass, it will hardly be worthwhile for you to try to carry out the instructions given in this book."

Apply Willpower to Yourself, not Others

Don't direct your energy and willpower toward **influencing or changing others.**

- *Do not impose your will on others*, e.g. take things from others, force them (mentally or physically) to do what you want them to do, or even insist they do something "for their own good".

- Likewise, *don't try to project your will out into space*, or insist the Source delivers something in a certain way. This will only create negative impressions that negate your positive requests.

Instead, **use your willpower on yourself.**

- Use the energy to *clarify your mental picture* and impress it on the Source. Then, let the Source chart the best path to attain those goals. Once you know what to think and do, use your willpower to force yourself to think and do those things.

- What you notice and think about will shape your beliefs. Use your willpower to *focus only on what you want*. If you want to get rich, do not think of your past financial struggles, complain to others about your problems, or envy others for their wealth and fame. Spend your time, energy and attention now on the things you want to create.

- The best way to *address poverty* is not to fight it or even sacrifice what you have for charity. It is to get rich yourself, inspire/educate others to become rich, and focus on new ways to create riches for yourself and the world. Treat poor people with joy and respect (not with pity), as if they're already becoming rich, and inspire them to find their own way to riches.

Part 3: Acting in the Certain Way

The Source sets things in motion by sending people, solutions and opportunities your way. You'll need to take personal action

KEY QUOTES

"You cannot retain a true and clear vision of your wealth if you are constantly turning your attention to opposing pictures."

"The poor do not need charity; they need inspiration.

"By thought, the thing you want is brought to you; by action you receive it."

to receive these gifts and convert them to money and riches. In so doing, remember not to take advantage of others or to give charity. Instead, give more use value than the cash value you receive.

Take Efficient Action

Taking efficient action means to **"fill your present place":**

- You can only *take action now, in the present*. If there's something you can do now to create success, do it. Don't fret over the past or wait for things to happen in the future. Do all that you can today, every day.

- However, *don't overwork* or rush into work meant for the future (out of worry that you won't have enough time or opportunity). It's not about how much you do, but how efficiently you do them.

- The key is to *ensure every small action you take is a success*—if you do so, these will accumulate to make your entire life a success.

Most people set their intentions fervently, then end up taking action in a half-hearted, distracted way. Put **100% of your focus** into whatever action you're currently taking, holding your vision as you perform your tasks.

- It won't work if you pray fervently once a week then forget about your vision. Everything you think, say, do must be aligned with your *definite purpose*.

- Have the *faith and gratitude* that what you're doing now is part of the process of delivering your vision.

- Use your leisure hours to *contemplate your vision* so it gets even clearer, more definite, and deeply lodged in your mind.

Getting into the Right Business

You can succeed in any area if you put your mind to it. However, it's generally easier to get rich and achieve success if you play to your strengths and focus on an area where you already have **well developed talent.**

KEY QUOTES

"Do, every day, all that can do that day, and do each act in an efficient manner."

"Do all that you can do in a perfect manner every day, but do it without haste, worry, or fear. Go as fast as you can, but never hurry."

"You can get rich in ANY business, for if you have not the right talent for you can develop that talent."

- Wattles recommends that you start with a business or vocation that fits your *inborn talents* or existing skills.

- If you feel a strong desire for another business or vocation (but have no existing talent or skill for it), set it as an *end-goal*, and gradually develop your abilities while growing your wealth. No matter what new business or career you wish to venture into, you must start with your current work.

It's common to start doing something, then realize that it's **not what you really want**, or it may even be something you hate to do.

- In such cases, *don't force yourself* to keep doing it, unless it's a means to get to an end.

- However, *don't rush into decisions* or quit immediately. Spend 1-2 days contemplating the vision of what you want—get connected with the Source, so you know the right action to take. You may very well find new ways to improve your current situation and grow yourself.

KEY QUOTES

"You will get rich most easily in point of effort, if you do that for which you are best fitted; but you will get rich most satisfactorily if you do that which you WANT to do."

Advancement

Every human being has an innate desire for advancement and to express himself/herself more fully. Thus, we seek greater wealth and and are attracted to those who can give us a more abundant life. You attract people when you **seek advancement** both for yourself and for others.

- Show that you're making progress in everything that you do, that you're *confident* of getting rich and can help others to get rich too. This will naturally draw customers and followers to you.

- Being confident is not the same as *boasting or bragging* about your success. As you gain influence and wealth, don't give in to the temptation to exert power over others, or compete with them to prove your worth/success.

"You are a creative center, from which increase is given off to all."

"Do everything that you do in the firm conviction that you are an advancing personality, and that you are giving advancement to everybody."

Regardless of whether you're running your own business or holding a job, embrace the concept of **continuous advancement.**

- Aim to *more-than-fill your current place*. When you become too big for your current role, you'll naturally progress to the next level.

- Take every opportunity to *be more than you are now*, and do it not to please others but to improve yourself.

Live and Spread the Truth

The Science of Getting Rich is essentially built on this simple truth—that you can generate any thought and impress it on the Source to cause it to take concrete form.

When you embrace this truth and know you can create whatever you want, you will **no longer fear scarcity and competition.**

Unfortunately, this truth contradicts most of what we see and hear around us. To think in a way that'll make you rich, you must **focus only on the truth**, regardless of how things appear to be.

- Put aside whatever you know or think you know about theuniverse, money, and wealth. Stop reading or watching any *material that contradicts the truths* in this book.

- Instead, keep reading and contemplating the statements below until you know them by heart and *believe 100%* that they are true.

"There is a thinking Stuff from which all things are made, and which, in its original state, permeates, penetrates, and fills the interspaces of the universe.

A thought, in this Substance, produces the thing that is imaged by the thought.

Man can form things in his thought, and, by impressing his thought upon formless substance, can cause the thing he thinks about to be created.

In order to do this, man must pass from the competitive to the creative mind; he must form a clear mental picture of the things he wants, and do, with faith and purpose, all that can be done each day, doing each separate thing in an efficient manner."

KEY QUOTES

"There is no such thing possible in this universe as a lack of opportunity for the man who is living the advancing life."

"The men and women who practice the foregoing instructions will certainly get rich; and the riches they receive will be in exact proportion to the definiteness of their vision, the fixity of their purpose, and steadiness of their faith, and the depth of their gratitude."

Live and spread the truth, so you become rich and also help others to get rich.

- *Existing governments and people in power* may try to keep the masses ignorant and in poverty. However, no institution or system can stop you from becoming rich if you follow the truths in this book.

- When there are enough people advancing and becoming rich, *entrenched systems* (that perpetuate scarcity and poverty) will naturally change.

Other Details in the Book to Look out For

This is a relatively thin book, presented in short chapters. Wattles reinforces the key ideas above in various ways to help us understand the abstract concepts and how to apply them in real-life. He promises that if you truly grasp the science in this book (like how you grasp the concept of addition or subtraction), then this will be the only book on getting rich that you will ever need.

KEY QUOTES

SO YOU WANT TO START A PODCAST

Finding Your Voice, Telling Your Story, and Building a Community That Will Listen

KRISTEN MEINZER

The Big "So What"

Podcasts are one of the fastest-growing media as people become busier and more mobile. This is a useful guidebook to help you start your own podcast, be it for personal interest or to market your business.

Introduction

Kristen Meinzer is a successful podcast host who has reached 10 million people over 10 years of her podcasting career. She has hosted numerous shows, produced podcasts for various brands, developed shows, taught classes on audio production, and spoken at various conferences.

This book provides the motivation for you to find your voice, with specific steps to help you develop the ideas, direction, and know-how to get started. To build a successful podcast, Meinzer recommends that you supplement this book with video tutorials on the more technical aspects of podcasting.

7 Steps to Build A Successful Podcast Channel

1) Dream it: Define your Whys and Whats

Start by defining your purpose or why you want to start a podcast.

- Don't start a podcast just because everyone is doing it. *Know your "why"*, e.g. to build a community around a specific cause, to teach a skill, or to grow the brand for your

KEY QUOTES

"I want this book to fill you with both information and affirmation. I want it to be a toolbox you can both rely on and stand on as you share what's in your heart."

business. For example, *By the Book* is a show co-hosted by Meinzer and Jolenta Greenberg. In each episode, they choose a different self-help book, follow it for 2 weeks, then assess if it made a difference. Through this self-help-cum-reality-show concept, they sought to push the boundaries of podcasting and spread empowering messages in an interesting way.

- Consider if a podcast is the best *method* to achieve your goals. Would your "why" be more effectively achieved through a book, blog, video or social media feed?

Define who your audience is, or who your podcast is for.

- Think of your *ideal listeners* in such detail that they're like real people you know and love to spend time with.

  (i) For example, Meinzer and Greenberg wanted *By the Book* to be for self-help lovers and haters, feminists and comedy fans. These may include single mums, women of color, men listening with their wives, or misfits who want to feel less alone or insecure.

  (ii) Meinzer and Greenberg each created 2 imaginary audience in their minds. Meinzer's fictional listeners are Louise and Anwar—one black and one white, one gay and one straight. She knows their personalities, interests, what they do in a typical day, how they were like in high school etc. Each time she has a question (e.g. whether a joke would work or whether it's ok to curse on the show), she'd imagine how specifically Louise and Anwar would react.

Decide on the subject/topic or what your show is about.

- *Don't settle for a 1-word answer*. For example, it's not enough to say that your show is about "movies". Elaborate on the idea, e.g. "Each week, a movie critic interviews 1 person who has had a similar experience as a movie character."

- Explore your concept, then distill it down to *1-3 sentences* that summarize your idea and why it's unique.

- Make it snappy and practice saying it out loud—you now have an *elevator pitch* to help you share your concept easily.

Creating and maintaining a podcast is hard work. So, be honest with yourself: do you really love or care about the topic or

KEY QUOTES

"Your show has to be something you can obsess over and that makes your heart sing."

outcome enough to want to keep working on it week after week? How will the podcast fit into your life?

2) Write it: Give it Structure and Substance

Choose your podcast format. You can choose any of the common formats below, combine/vary the formats or invent your own:

- *Interviews*: where the host speaks with different guests each episode;
- *Roundtable*: where a team of 3-4 opiniated hosts discuss and debate a topic;
- *Lists*: where the host goes through lists such as "the worst things to eat" or 10 things to do before you die;
- *Daily news*;
- *Advice*: where the host offers advice to people who write/ call in;
- *Documentaries*: where the host presents a different story each episode or 1 story over several episodes;
- *Investigations*: where the host unravels mysteries or cases;
- *Game shows*: where guests play games or solve puzzles; and
- *Stories*: where the host narrates a short story each episode, or a long story over several episodes.

Every great show—no matter how fun or spontaneous—needs a structure or blueprint. For example, *By the Book* follows a structure like this:

Intro	Hosts play the theme song, introduce themselves and the book of the week (including a summary, the author's bio and the steps/tips they'll be following), all within 6 min
Review of Week 1	Hosts share their 1st week of living by the book (6 min each). Followed by a music bump or ad break.
Review of Week 2	Hosts share their 2nd week of living by the book (6 min each). Followed by a music bump or ad break.

KEY QUOTES

"The one thing that's guaranteed to kill any podcast…is a lack of love."

"Structure is something to be grateful for, not to resent."

Verdict	Hosts share their verdict on the book (3 min each).
Closing credits and easter egg (a funny/surprising outtake).	

- Once you have a rough structure, *test it out* using practice/ pilot runs. Keep adjusting until it feels right.

- Remember: the *first 5 minutes* of the show is the most critical. Share just enough to acquaint new listeners to your show, then move straight into the action!

Before every show, you must prepare your script, including your research, supporting materials and notes.

- Here are some *quick tips*:

  (i) For *news shows*, start with a table of contents followed by the biggest story.

  (ii) If you're using *recorded tape or audio* collected outside the studio, let the recordings tell the story. Choose clips that best illustrate your story and work your narration around them.

  (iii) For *stories/reality shows*, get creative and take some risks!

  (iv) For *lessons and histories*, make sure you string the facts into engaging stories.

- *Read aloud* to test out the effect of the words. Inject your unique sense of humor, vocabulary, and personality.

- Ultimately, your podcast will only shine if you *become a superb storyteller*. Go for short, punchy sentences, and choose words that are visually-rich to bring facts to life. Fill the high points and low points of the story with visual details to touch your listeners' hearts and minds.

Once you're clear what your show is about, choose a strong title. Research what's out there and avoid a title that's already being used. Make sure the title reflects what your show is about. Keep it brief, easy to say and remember.

3) Host it: Select your Ideal Host(s)

Consider diversity when choosing your host(s) and team/ guests.

KEY QUOTES

"Find the arc in each story you're telling, or create it. Play up what's exciting, and give gravity to what's serious. Make things come alive."

"Talk in stories, not facts...As much as possible, show, don't tell."

- In the USA, where the majority of podcasts are hosted by white men, diversity can bring several *benefits*. It can help you to stand out, connect with more listeners, and expand your perspective.

- To *recruit a diverse team*, guests and experts, you can attend minority networking groups, place ads in minority newsletters or university job boards, reach out to social media communities or research experts in any domain.

Don't worry about your accent, voice or if you sound like a "professional" podcaster. Just sound like yourself—use your natural voice, laughter, figures of speech, and share your passions, opinions and sense of humor.

- *Being professional* isn't about imitating others. It's about being prepared for each show and producing a quality podcast.

  (i) Prepare your materials in advance, and warm up before each show (e.g. do a few jumping jacks or sing a song).

  (ii) Place the mic 1 fist away from your mouth (and slightly to the left/right), enunciate your words, and minimize fillers (e.g. "um", "uh" or "like"). Energize your voice by standing up, smiling and gesturing with your hands.

Consider having a co-host to add contrast, balance and diversity to the show, transform the dynamics and make it much more fun.

- Approach people whom (i) you enjoyed working with, (ii) admire, and/or (iii) have complementary skills or personality. You can do a few *pilot runs* with different people before making a decision.

- Your co-host is basically your *partner and co-pilot*.

  (i) Agree on your respective roles/persona *on the show* (e.g. skeptic vs believer, conformist vs revolutionary) as well as *off the show* (e.g. focusing on research vs production).

  (ii) Do your part, but learn to give and take if one person occasionally does more than the other.

- Make time to *address conflict* instead of avoiding it. You won't enjoy the show if you're fighting, and listeners can

KEY QUOTES

"A diverse team means you're part of the solution, not the problem."

"It's your show, my friends. Make it sound like you."

"Podcasts—even the most informative of them—are entertainment, conversation, and companionship."

"Be a 'yes, and' host, not a 'no, it's all about me' host."

sense the underlying tension even if you pretend everything's ok.

KEY QUOTES

4) Cast it: Get the Ideal Guests On Your Show

Identify who you want on your show in order to tell your story. There are 3 main types of guests:

- *Real people* help to bring specific ideas to life, e.g. individuals who're affected by a new policy or trend. You can reach out to your personal contacts, or search online for virtually *any* community (from activist groups to religious organizations and gay communities).

- *Experts*. If you know the experts' names and organizations, contact them through their website, social media accounts or their organizations' PR department. If you don't have a specific expert in mind, then start by researching professional clubs, associations or networking groups.

- *Celebrities* may be famous because they're movie-stars, award winners, or influencers on social media.

  (i) Identify the agencies that represent them, identify yourself as a journalist, and ask for the publicist's contact. Then, email the publicist to clearly and succinctly share how their client will benefit from being on your podcast.

  (ii) If the celebrity has recently released a book/album or appeared in a movie, ask to interview them about the project. If they're philanthropists, approach the charity's PR team and ask to discuss their latest work. You can always add other questions during the interview.

- The key is to *be persistent*—keep sending emails, messages, and making phone calls until you get a reply.

Once you get a positive response, start preparing your guests:

- If you definitely want the guest on your show, reply immediately to *confirm the deal* and give the details for the interview.

- If you need to assess the person further, set up a 10-min phone *pre-interview*.

  (i) Introduce your show (topic, tone and what to expect). Explain that this is a brief get-to-know-you session, not the actual interview.

  (ii) Ask questions to assess if their experience/story fits with your show, if they're willing to share openly, and if their energy level is high and positive. Take notes.

  (iii) If you decide to proceed, confirm the deal right away and send a follow-up email with the interview details. If not, thank them for their time and send a reply within 24 hours to say that you've decided to go with a different story angle.

To conduct a great interview:

- *Prepare in advance*. Learn what you can about your guest (e.g. background, achievements, aspirations, setbacks) and know why exactly they're on your show.
- Define the *5 most important points* you want to hit, and structure your questions/conversation around them.
- *Make your guest feel welcome*. Let them know what to expect (e.g. "This will be a casual 5-min chat about your adventure"). Since it's a recording, they can redo a section if there's a mistake.
- *Listen more, talk less*. If the guest says something interesting, ask follow-up questions to invite them to share more.
- Be human and *bring out their humanity*. Show that they have hopes, fears, passions and failures just like the listeners.
- *After the interview*, thank them and follow up with an email. When the episode is out, remember to send them the link.

Meinzer recommends that you learn the entire production process first, then consider hiring a producer if you can afford it. A producer can handle almost every aspect of the show, e.g. develop story ideas, create production schedules, book and manage guests, research and write scripts, edit/publish/promote episodes, etc.

Get objective feedback so you can improve:

KEY QUOTES

"Know not just about them, but know for certain why you want to talk with them."

"Be human. Let them be human...More than anything, be you."

"Knowing all parts of the machine means you can fix any part of the machine, and it also means you can prevent certain problems from happening in the first place."

- *Review your own podcast* closely. Look for points when the energy drops or it feels draggy. Consider which parts went well or badly, and why.

- Ask your *team members* for inputs, or ask the *listeners* what they want more or less of.

- Join a *podcast club* where you can connect with other aspiring podcasters, or attend a relevant *class or workshop*.

5) Make it: Create Your Podcast

To get started, you just need a few key pieces of equipment inaddition to your computer. These include:

- A good-enough *microphone* (or 2-3 mics if you have co-hosts). There's no need to spend a fortune on a top-grade microphone—you can start with just a USB mic (that can be directly plugged into your computer) and a pop shield (to reduce popping sounds).

- A set of *headphones* so you can listen to yourself while recording and editing.

- *Recording and editing software*. Beginners can start with simpler options such as Adobe Audition, Audacity or Garage-Band.

- *Optional: a portable audio XLR recorder* that allows you to plug in 2-3 mics to record multiple tracks in separate audio files. This requires XLR microphones (not USB ones) and a memory card.

- A *quiet room* to do your recording. You can even do it in your closet with your clothes serving as acoustic padding.

There are several options to record the podcasts with your guests.

- Invite the guest to your *home studio*.

- Rent a *recording studio* at a mutually-convenient location.

- Go to your *guest's location* with your equipment.

KEY QUOTES

- Do a *remote interview* or tape-sync, where each party records the conversation from their respective ends. You can:

  (i) Send the guest a USB mic, ask them to plug it into their computer, record the conversation, then send you the file; or

  (ii) Hire a local producer to go to their place (or a studio near them) with the equipment.

- Do a *conference call* (via Skype, Zoom etc) and record the call. Or, explore other options like Report-IT or ipDTL.

- Connect over the *phone* only as the last resort, since the sound quality is usually terrible.

Next, edit the audio files. The process and outcome will be better if you had recorded separate tracks for you and your guest.

- Get a *transcript* of the raw audio so it's easier to find the ideal moments and stitch them together.

- Focus on the *big picture* first. Based on what you've recorded, what story do you wish to tell? Find the sections that best tell your story, paying attention to the parts that tug at your heartstrings (vs those that put you to sleep).

- With the end in mind, start *cutting and editing* the tape.

  (i) Never present your guests' words out of context or edit them to mean a different thing.

  (ii) Remove the rambling, coughs/sneezes, or unexpected noises.

  (iii) Remove most of the fillers (e.g. "ums") but not to the point it sounds unnatural. Fillers can even be useful for connecting 2 disjointed parts.

  (iv) Avoid abrupt changes to tempo, tone, volume, or loud/long stretches of music. Keep any theme song to <30s.

- As you edit, identify *areas to improve* for future recordings, and have fun in the process!

Other important considerations include:

- *Intellectual property rights*. As a rule of thumb, go for *podsafe* (royalty-free) music/movie clips and written material. Official

KEY QUOTES

"Do what you can to make them sound like the truest version of themselves."

movie clips and trailers are safe for the purposes of movie reviews or discussions, though you can contact the TV or movie press-reps for *electronic press kits*. Always credit the creator/author and consult an attorney if in doubt.

- *Podcast length*. Ideally, keep your podcasts to 20-40 minutes. Meinzer recommends starting with a shorter show of ≈20min as it's easier to manage and you'll be forced to make every second count. You can always extend the duration in future.

- *Know what all listeners love or hate.*

  (i) Listeners love solid takeaways (e.g. clear insights and conclusions), hosts who're willing to reveal their personal and vulnerable side, and predictability with some surprises (e.g. a standard structure with occasional twists).

  (ii) Listeners hate poor sound quality (e.g. noisy background), overproduced audio (with too much special effects), inconsistency (in schedule, tone or structure) and a lack of empathy for listeners.

KEY QUOTES

"Make sure that every word must be."

"[Listeners] want their hosts to be human, not perfect."

6) Share it: Distribute your Podcast

Create your release schedule.

- *Be consistent* with your podcast releases so listeners know exactly which day/time to expect your show. Generally, it's fine to do a release *every 1-2 weeks*. Don't be too ambitious (e.g. daily releases) or too infrequent (e.g. monthly releases).

- *Communicate* your schedule clearly:

  (i) If it's an ongoing series, remind listeners that you'll be back at the same time/day next week.

  (ii) If it's a seasonal show (e.g. 1-2 seasons per year), indicate when the next season will start.

  (iii) If it's a short-run series (i.e. a limited number of episodes), thank listeners for joining you for that duration.

Make your podcast stand out.

- Create an attractive *show art*. This will be just a tiny square on a small screen. So, keep it simple and make sure the words are clear and legible. Decide on your color palette and image, then use the same style across all your marketing messages.

- Make sure your *episode titles and descriptions* are catchy.

  (i) Finalize the *episode title* only after you've edited the episode. Focus on what's interesting e.g. "Ariana Grande on her saddest childhood memory." Number your episodes if they run in sequence, e.g. "Ep. 1: ABC", "Ep. 2: XYZ".

  (ii) Keep the *episode descriptions* succinct. Include a hook that highlights the story you'll be telling, names of notable persons, events or places, contact information, links and advertiser acknowledgements.

Distribute your podcast in 4 steps:

- Save your episode in the *right format* (typically mp3);

- Choose your *hosting platform*. You can use a podcast-friendly hosting option (e.g. Libsyn, SoundCloud) or your own blog (e.g. Wordpress, Wix, Squarespace).

- Set up your feed. An *RSS feed* is basically a list of your episodes with key metadata (e.g. title, author, description, cover art, categories, and duration).

- Send your podcast/feed to as many places as possible (e.g. Google Podcasts, Apple Podcasts, Spotify)—a process called *syndication*. When you update your RSS feed in future, all the stores you're registered with will be automatically updated.

Sadly, most podcasts don't make money. To get listeners to pay, they must first feel engaged and invested in your show. To attract advertisers, you probably need ≥5000 listeners per episode. Here are some monetization options to explore:

- *Donations* from your listeners in return for gifts, shout-outs or other rewards;

- *Paid membership or subscriptions*, e.g. offering perks like ad-free listening or bonus content for a few extra dollars each month;

KEY QUOTES

- *Advertising*: Look for advertisers who're open to smaller shows and want to reach your specific audience. For example, a show about motherhood is ideal for companies selling baby food or diapers; and

- *Sponsored content*: This is where advertisers pay for their products to be a central part of your story. However, this could mean a longer production process and some loss of control over your storyline.

7) Grow it: Promote your Podcast

It's not enough to create a great podcast. You must promote your show if you want more people to discover and enjoy it. One of the best ways to spread the word is to build a community.

- In every episode, *create engagement within the show*:

  (i) Mention how people can reach you and why they should write/call. You can set the phone number to go to voicemail for people to leave a message.

  (ii) Invite listeners to share their experiences for a specific topic, let them contact you for advice or to offer advice.

  (iii) Add assignments, e.g. get listeners to answer questions or solve a puzzle, then selectively acknowledge the participants.

  (iv) Ask listeners questions that lead to new stories, e.g. their most embarrassing incident, their first love.

- You can also *build engagement outside the show*:

  (i) Create a space (e.g. a Facebook community) where listeners can interact with one another.

  (ii) Use social media or your website to share glimpses of your personal life, what you're reading or thinking about, etc.

  (iii) Create opportunities for people to meet you in person, e.g. via live shows and meetups.

- Encourage your community to *bring others onboard*:

KEY QUOTES

"The onus is on you to get the word out—every week, for several hours a week."

(i) In every episode, ask listeners to rate/review your podcast. Occasionally read out the reviews and thank your listeners.

(ii) End every interaction with a reminder to spread the word, e.g. "Thank you so much for following the show and for spreading the word to all your friends and family!"

Here are 7 additional ways to get the word out:

- *Tell everyone about your show*: share your elevator pitch with links to your show.
- *Create a web-page* so people can find you.
- Use *guerrilla marketing*, e.g. jump onto podcast discussions (on Reddit, Twitter etc.), and say something provocative so people will respond and learn about your podcast.
- Do *promo swaps* with other hosts with a similar audience size and profile. Or, *pitch yourself as a guest* for these shows. When you're being interviewed, don't just answer the questions directly. Steer the conversation to what you wish to say. Imagine that your show is about macho men with a sensitive side, and the other host is asking a question about rugby. You can pivot the discussion by saying, "Interestingly, rugby is seen as one of the most "macho" sports. The macho men on my show..."
- After each interview, send the guests a *thank you note* with a link to the episode and a request to share the link. Tag them in your social media posts (along with a great quote from the show) so they're more likely to share/retweet the post.

When you receive harsh criticisms or mean comments, don't take it personally. Try to sieve out the constructive feedback from the insults, and see it as an opportunity to create engagement and publicity. By acknowledging and addressing your shortfalls, you can win your listeners' loyalty.

Embrace your identity as a podcaster. Use the title in your name cards, say the title out loud and immerse yourself in the world of podcasting to build your knowledge and contacts. For example, you can (i) subscribe to podcasting newsletters and publications, (ii) join podcasting communities and weigh in on the discussions, (iii) attend conferences about podcasting,

KEY QUOTES

"Say what you want, not what you're asked."

"Turn all your thank-yous into self-promotions."

"Embrace your voice! Share it with the world!"

(iv) reach out to people you admire, and (v) take classes and courses.

Other Details in the Book to Look out For

This is a fun, lively book written in short and easy to read chapters. Besides the tips captured in this summary, the book also includes useful information such as podcast statistics, sample email pitches and confirmation emails for guests. For more information, please visit www.kristenmeinzer.com

About the Author

Kristen Meinzer is a podcast host, producer, and former director of nonfiction programming for Panoply. Her hosting credits include Stitcher/ Panoply's By the Book, CNN's Decades of Movies, and WNYC/PRI's Movie Date. Her producing credits include Happier with Gretchen Rubin, The Sporkful, Food 52's Burnt Toast, Girlboss Radio, and other award-winning shows. Kristen's work has been mentioned in numerous publications including Time, Washington Post, Buzzfeed, and Indiewire.

About ReadinGraphics

READINGRAPHICS
Ideas Come Alive

ReadinGraphics captures pearls of wisdom from the best books around the world, chunks down concepts into simple, actionable steps, and presents them in graphics that you can absorb at a glance.

We cut through the clutter to bring ideas to life, making it easier to see, organize and apply insights to create breakthroughs.

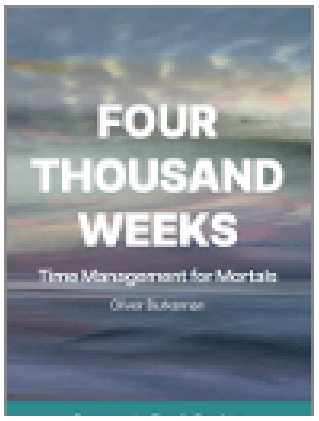
KEY QUOTES



FOUR THOUSAND WEEKS

Time Management for Mortals

Oliver Burkeman

The Big "So What"

If you live to 80 years old, you only have 4,000 weeks on Earth. Rather than cram more into your life, how can you live each day more meaningfully? This book helps you to answer this question, so you can make peace with your limitations, focus on what truly matters, and live a more purposeful and fulfilling life.

Introduction

Today, we're surrounded by strategies, tools, and resources to help boost our productivity. Yet, the more efficient we become, the more we cram into each day, only to end up feeling more rushed, more impatient, and unfulfilled.

- We often feel guilty for not accomplishing all that we expect of ourselves. We get frustrated by time-wasters, without pausing to consider what all the frantic rush is *for*.

- Burkeman, formerly a productivity geek, used to believe that he'd get a peace of mind when he finally got on top of his tasks. However, that day never arrived, and he only felt increasingly stressed and unhappy.

This book offers a new perspective on productivity and time management. Burkeman suggests that the solution is to stop trying to manage time as a resource. Instead, accept that you have a finite amount of time on Earth, and consciously choose what to do with it.

KEY QUOTES

"Time management, broadly defined, should be everyone's chief concern. Arguably, time management is all life is."

"The world is bursting with wonder, and yet it's the rare productivity guru who seems to have considered the possibility that the ultimate point of all our frenetic doing might be to experience more of that wonder."

Shifting from Productivity to Purposeful Living

Rethink Your Relationship With Time

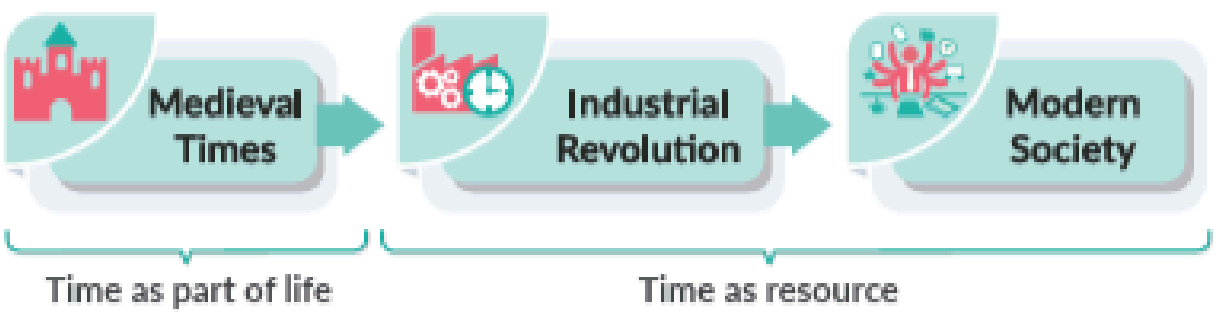
A lifespan of 80 years translates to merely 4,000 weeks, which means your time is limited. Yet, the problem isn't with our finite time, but how we think about it.

Historically, **people used to think of time differently**.

- Before mechanical clocks, people viewed time as the essence of life, or the river in which life flowed. They "measured" time using the day's natural rhythm (e.g. sunrise and sunset), and accepted that things took as long as they needed to take. A medieval farmer, for example, worked in tune with nature's schedule, not a clock. He wouldn't try to compress a year's harvest into 1 month, or get a month's worth of milk in 1 day.

- With the mechanical clock and Industrial Revolution, our relationship with time was fundamentally changed. Laborers were paid by the hour, factories operated during fixed hours, and a new demarcation appeared between work and leisure. We could literally see the minutes and hours slipping by, and started to treat *time as a resource* to be used and traded. We try to "save" time, feel guilty if we "waste" time, and seek to work ever harder, faster, and smarter.

- Our perspective on time is also shaped by *external forces*. For example, Capitalism views everything (including time and people) as tools for profit. If you're a lawyer who bills your clients by the hour, you may start to see each hour with family or friends as an opportunity cost, and thus an indulgence you can't afford.



KEY QUOTES

"Before, time was just the medium in which life unfolded... Afterwards...time became a thing that you used."

"[Time] stops being the merely the water in which you swim and turns into something you feel you need to dominate or control."

Beware the Efficiency Trap

Research shows that people are feeling busier than ever, and this sense of overwhelm occurs at every economic level. Those further down the economic ladder might feel overstretched as they work 2-3 jobs to pay the bills, while those further up the ladder might feel overloaded due to higher mortgages, job demands or social obligations.

Ironically, we try to solve our busyness by doing more. Instead of cutting back, we pack more into our days, believing efficiency can somehow help us to do it all. We use productivity hacks (e.g. "batch" our work or use prioritized to-do lists) to work faster.

- However, the more you fit into your life, the more you have to do. *The goal-post keeps shifting*. This is summed up by Parkinson's Law, which says that "Work expands so as to fill the time available for its completion."

- Burkeman calls this the "*efficiency trap*". For example, the sooner you reply to emails, the sooner others reply, which means more emails in your inbox. And, if people know you reply quickly to emails, they're more likely to write to you. As a result, the faster you respond, the more emails you get. The more you try to control time, the more you become controlled by it.

"Existential overwhelm" is the feeling that there's always more to do or explore than possible.

- In modern societies, secular changes have led to fewer people believing in an afterlife. As a result, people feel pressured to *make the most of this life*—the only life they have. We try to pack our lives with experiences, yet we feel dissatisfied because there's always *more* to be experienced.

KEY QUOTES

"You have too much to do, so you try to fit more in, but the ironic result is that you end up with more to do."

"The trouble with attempting to master your time, it turns out, is that time ends up mastering you."

"The problem with trying to make time for everything that feels important–or just for enough of what feels important–is that you definitely never will."

- There's an infinite number of *leisure activities* you can do, and it's impossible to experience all of them in your lifetime. The Internet further amplifies what you're missing out on.

As you cram more into your life, the quality of your activities also drops.

- If you think that you can somehow get everything done, you're more likely to *accept a task/request* without stopping to consider if it's worth doing, or what you must sacrifice to do it.

- When you're busy and overwhelmed, you're also more likely to opt for *convenient solutions* instead of valuable ones. You might message a friend instead of meeting up in person, or grab some fast-food instead of cooking a meal.

To overcome anxiety and overwhelm, the best solution is to accept reality. There are infinite things you could do, but you're limited by finite time, energy, attention, and resources. Rather than try to tick off every item on an endless to-do list, consciously choose how to spend your finite time meaningfully.

KEY QUOTES

"Convenience...makes things easy, but without regard to whether easiness is truly what's most valuable in any given context."

"I'm aware of no other time management technique that's half as effective as just facing the way things truly are."

Live in the Present, Not in the Future

Viewing time as an instrument makes us treat each moment as a means to an end.

- We often *put our lives on hold*, thinking "After this, I can relax" or "Once I get that promotion, I'll find love." We treat every task and event as a stepping stone to something else.

- Burkeman's perspective shifted with fatherhood. He wanted to savor his son's early years, yet found most parenting advice focused on preparing children for the future. When we treat childhood as a training ground for adulthood, we rob it childhood of its *intrinsic value*.

When we live mentally in the future, we miss out on the present.

- Burkeman observes how tourists at a museum often take photos and videos of the art pieces instead of enjoying them there and then. We use mindfulness practices to try and be present, missing the fact that we are *already* present in the

"Stop postponing the 'real meaning' of your existence into the future, and throw yourself into life now."

"[To live] more fully in the moment starts from noticing that you are, in fact, always already living in the moment anyway, whether you like it or not."

moment. Many rich people are unhappy despite their wealth, because they see the current moment as a *stepping stone to a happier future*.

- You don't necessarily need more money and status to feel happier, and you don't need to keep doing more to prove your inherent worth. Learn to *appreciate the present while keeping an eye on the future*. Find contentment in the simple pleasures already available to you.

Embrace Your Finitude

Philosopher Martin Heidegger argued that humans don't have a finite amount of time; we *are* a finite amount of time. He used the term "finitude" to describe how our limited time fundamentally defines us.

- Here's an uncomfortable truth: our time on Earth is not an entitlement. *We are all living on borrowed time*. If you died tomorrow, there's nothing you can do about the time you "lost", because you never owned it in the first place. You don't actually *have* time; you merely expect it, and there's no guarantee you'll have more time beyond the present moment.

- People who've had a close brush with death often start to see time differently. You don't need a tragedy to *shift your perspective on time and mortality*. The next time you feel annoyed at waiting in queue, or feel frustrated that someone is late, pause to appreciate the fact that you're alive right now. Instead of feeling cheated of time, cherish the present moment as it might be all you have.

Every decision you make closes off other alternatives, and propels you down a certain path. This is happening whether you're aware of it or not. If you're not choosing your paths intentionally, then you're just stumbling through life blindly.

- *Accept the trade-offs* in every choice. When you choose 1 important thing, it means giving up lesser priorities and saying "no" to other opportunities. Make peace with that.

KEY QUOTES

"Usually there'll be no way to know, in the moment itself, that you're doing it for the last time."

"We cannot get anything out of life. There is no outside where we could take this thing to... The life of this moment has no outside."
—Jay Jennifer Matthews

"Once you stop believing that it might somehow be possible to avoid hard choices about time, it gets easier to make better ones."

Dispel the Illusion of Control

We want to see time as a separate tool or resource, because it gives us the illusion of control.

- In reality, *you cannot control time*. The Hofstadter's Law says that tasks always take longer than planned. You might think you have 5 hours to complete a project, but issues crop up. You expect to meet with a friend next year, but she passes away before then.

- *You also cannot predict the future*. If you look back at the events that led to where you are today, you'll find that many were beyond your control. For example, your parents might have migrated to a new country while you were young, or you might have met your spouse at a random party. You survived those chance encounters in the past, and will probably survive whatever life throws at you in the future.

While planning is useful, remember that plans don't give you the power to control the future. You can't prevent bad things from happening, nor force things to go according to your expectations. Instead of resisting your circumstances, allow things to happen at their own time and just do the best with what life offers.

Reclaim Your Focus

Your attention is limited, just like your time. What you focus on defines your reality, e.g. if you constantly follow news about crimes and disasters, you'll see the world as a dangerous place. In the end, your life will be the sum of what you pay attention to.

- Social media isn't really "free" because the tech companies are selling your attention to advertisers, and using data tracking and psychological tactics to keep you hooked. Our *digital devices* often distract us from other important matters—we spend hours on our devices daily, and our minds tend to linger on trivial online interactions even when we're offline.

KEY QUOTES

"You can never be truly certain about the future. And so your reach will always exceed your grasp."

"All a plan is–all it could ever possibly be–is a present-moment statement of intent... The future, of course, is under no obligation to comply."

"What you pay attention to will define, for you, what reality is."

"The distracted person isn't really choosing at all. Their attention has been commandeered by forces that don't have their highest interests at heart."

Burkeman argues that we choose to get distracted to avoid painful issues or decisions.

- For example, when it's time for an important task, you might suddenly feel the urge to check your emails or surf the internet. That's because taking action means *facing up to your realities* and limitations, instead of just dreaming about ideal outcomes.

- Fixes like digital detoxes typically won't work in the long-term, as they don't address the root causes of the discomfort, and you'll just turn to other distractions. The best way to overcome a distraction is to accept and *pay attention to the underlying discomfort*. When Steve Young trained as a Buddhist monk, he had to pour freezing water over himself daily. In the process, he learned that trying to distract himself from the cold only worsened the agony. The best way to ease his discomfort was actually to focus on it. This training helping him to drastically improve his concentration.

Cultivate Patience

Burkeman suggests that we're getting more impatient as a society. In a traffic jam, people start honking even though it doesn't change anything. We stop the microwave oven before the time is up, just to save a few seconds.

- Our *addiction to speed*, much like an addiction to alcohol, is often a form of emotional avoidance. We feel as if we must move faster to be happy, when it only leaves us feeling more anxious and restless.

To break this cycle, stop trying to move faster and allow things to take their time. Cultivate patience to enjoy better results and satisfaction.

- In face of a problem, *don't rush to adopt the first solution* that comes to mind. If you can sit with the unease of not having an immediate answer, a better solution will often emerge.

- Adopt *3 principles of patience*:

  (i) *Embrace challenges* as a part of human existence. Recognize that a problem-free existence would be meaningless.

KEY QUOTES

"The paradoxical reward for accepting reality's constraints is that they no longer feel so constraining."

"As the world gets faster and faster, we come to believe that our happiness, or our financial survival, depends on our being able to work and move and make things happen at superhuman speed."

"If you're willing to endure the discomfort of not knowing, a solution will often present itself."

(ii) *Choose incremental progress* over immediate completion. Stop work each day when the time is up, even if you still have excess energy. This builds patience for long-term success.

(iii) Give yourself *time to develop mastery and originality*. When you first learn something new, it's normal to imitate others. Your unique style tends to emerge as you grow over time.

Enjoy Rest and Leisure For Their Own Sakes

In the past, ancient philosophers like Aristotle viewed leisure as the goal in life. Work was just the means to enable more leisure time. Religious traditions like the Sabbath (a day for rest and observance) are also built on the belief that whatever work done by week's end is sufficient.

By contrast, modern societies now treat leisure as the means to an end.

- We feel compelled to justify leisure as a way to boost productivity, improve ourselves, create memories, or to build the foundation for some *future payoff*.

- We feel guilty for being idle or lazy, a concept that sociologists call "*idleness aversion*." We try to pack every day of the week, with shops staying open daily and digital devices keeping us connected all the time.

- In "Midlife", Kieran Setiya highlights the difference between *atelic and telic activities*.

  (i) Atelic activities are valuable in themselves and there's no need to "complete" them. For example, you can enjoy walking or listening to music for their own sakes. Telic activities are done to achieve a specific outcome.

  (ii) Midlife crisis often kicks in when we start to realize our mortality, the futility of chasing future goals, and start to focus more on present experiences.

KEY QUOTES

"The presence of problems in your life...isn't an impediment to a meaningful existence but the very substance of one."

"Enjoying leisure for its own sake–which you might have assumed was the whole point of leisure–comes to feel as though it's somehow not quite enough."

"Results aren't everything. Indeed, they'd better not be, because results always come later–and later is always too late."

Burkeman urges us to enjoy rest and leisure for their own sakes, without guilt. Pursue hobbies that bring you joy and satisfaction, even if you're mediocre at them and there's no financial or social benefits to be gained.

Adopt Intentional Neglect

Everyone procrastinates. "Bad" procrastination stems from being paralyzed by your limitations. This could come from:

- *Perfectionist expectations*: You hold back because you think you lack what it takes to achieve your dream outcome; and/or

- *Indecision*: You're stuck between choices, e.g. you can't decide between various career options, or you want to leave an abusive relationship yet secretly hope for things to change. You fail to commit—until the ship has sailed and you no longer have to decide.

"Good" procrastination comes from accepting that you can't do and have everything you want. You make sound decisions to (i) do what matters most, and (ii) procrastinate on lesser priorities.

- Burkeman shares *3 principles for intentional neglect*:

  (i) *Pay yourself first*. In personal finance, this means saving before paying your bills. Similarly, prioritize important goals (e.g. developing a relationship or learning a new skill) before other tasks. Don't wait.

  (ii) It can feel overwhelming to have too many tasks or projects running concurrently, and you can't get anything meaningful done if you abandon a project once it gets hard or boring. The solution is to *limit your work-in-progress*: (a) finish an old project before starting a new one, and (b) break big projects down to bite-sized chunks that you can finish.

  (iii) *Avoid the lure of secondary priorities*, as they're the most likely to distract you from your core priorities. List down your top 25 priorities, then focus only on the top 5 and deliberately avoid the rest.

KEY QUOTES

"In order to most fully inhabit the only life you ever get, you have to refrain from using every spare hour for personal growth. From this perspective, idleness isn't merely forgivable; it's practically an obligation."

"The real measure of any time management technique is whether or not it helps you neglect the right things."

Commitment gives you freedom. Research shows that when people commit to something, they appreciate it more than those who can still change their minds.

- Political theorist Robert Goodin argues that you must commit to something to attain *excellence or fulfillment*. For example, you can't be the best musician in the world if you don't devote your time and focus to music.

- Commitment is also essential for *relationships*. A romantic relationship can't be fulfilling if you break things off every few years in hope of finding a better partner. Ultimately, there's no perfect person who can meet all your conflicting needs. Someone who's stable and predictable is also unlikely to be a regular source of adventure and excitement.

- *Making a commitment* frees you from the need to keep choosing, so you can direct your focus in more meaningful ways.

Choose Shared Experiences Over Full Control

Many people love the idea of having full control over their lives—to have the freedom to do whatever they want, whenever they want, and without answering to anyone.

Burkeman argues that time should be shared, not hoarded.

- Sacrificing some personal freedom can lead to *greater fulfillment* if you get to spend the time with loved ones. For example, digital nomads have the freedom to travel, yet many feel lonely because their lifestyle makes it hard to form deep relationships.

- Time is a network good. Similar to mobile phones and social media accounts, *time is more valuable when it's shared with others*. Many activities, such as socializing or going on dates, require others' participation. In 2013, Terry Hartig found that Swedes were happier when they took time off work, and happiness levels were even higher when they had shared time off. He suggested that what people needed wasn't more control over their personal schedules, but better "social regulation of time".

KEY QUOTES

"We'll do almost anything to avoid burning our bridges, to keep alive the fantasy of a future unconstrained by limitation, yet having burned them, we're generally pleased that we did so."

"When you can no longer turn back, anxiety falls away, because now there's only one direction to travel: forward into the consequences of your choice."

"Freedom, sometimes, is to be found not in achieving greater sovereignty over your own schedule but in allowing yourself to be constrained by the rhythms of community."

"The value of time comes not from the sheer quantity you have, but from whether you're in sync with the people you care about most something intangible."

- Human beings are naturally inclined toward *synchronicity*: we tend to sync our steps when walking with someone, and Roman soldiers could march longer when they moved in unison. When you feel like a part of something bigger than yourself, it can be more fulfilling than having complete control over your personal time or schedule.

Find Freedom in Your Cosmic Insignificance

All of us want to believe that our lives mean something, and we feel a sense of grandiosity when we talk about "what matters most" in life. Yet, in the grand scheme of things, what you do doesn't matter at all.

- Human civilization (about 6,000 years old) is a blip in the universe's timeline, and each of us a miniscule part of history. At a cosmic level, no individual can make a dent in the Universe—even famous names like Mozart, Einstein, or Marie Curie.

Realizing our cosmic insignificance can be liberating, because (i) it puts our problems and daily struggles into perspective, and (ii) frees us from illusions of grandeur.

- Instead of holding yourself to unattainable standards, focus on *meaningful activities within your reach*. Ask yourself: How can I make the most of my time now, assuming this moment is all I have? This may include the things you're already doing but didn't seem grand enough. For instance, the Covid pandemic brought pain and disruption, but also reminded us of simple pleasures like gardening, cooking, and family time. It forced us to reevaluate our daily lives and routines, such as long commutes to work or under-appreciation of essential workers.

Let Go Of The Illusion of Time Mastery

We want to master time, stay in control and feel like our lives matter. Yet, time mastery is an illusion: No matter how good you get at time management or your specialization, you can't

KEY QUOTES

"Time just feels realer – more intense, more vivid, more filled with meaning – when you're synchronized well with others."

"Because now is all you ever get."

handle everything thrown at you. And none of our lives can truly matter in the cosmic timeline. Embrace life's finitude, free yourself to live fully in the moment, and focus on what truly matters to you and those around you.

Use these 5 questions to guide yourself:

- *What necessary discomforts are you avoiding*? Embrace risks and challenges that help you to grow, rather than hide behind the illusion of safety or control.
- *Are you holding yourself to unattainable standards?* Consider what you'd do differently if you stopped chasing after an impossible to-do/bucket list.
- *Have you accepted yourself as you are?* Or are you striving to be someone else (and living by others' standards)?
- *In which areas of life are you still holding back* because you don't feel prepared? Free yourself by taking action regardless.
- Most meaningful activities like care-giving or community-building cannot be measured by concrete outcomes. *How would you spend your time differently* if you didn't care about end-results?

Ultimately, we must each find our own path without knowing what the "right" course of action is. As Carl Jung advised, just do what feels necessary and trust that life will unfold as it should.

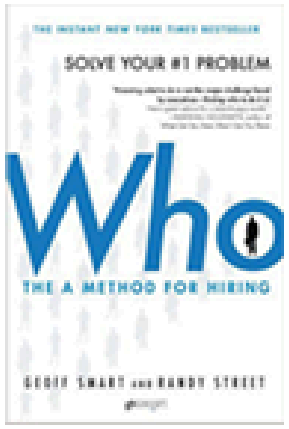
Other Details in the Book to Look out For

This book is written in a conversational style, packed with personal anecdotes, examples, and research references to help us reflect on finitude and rethink our relationship with time. For more details, please visit www.oliverburkeman.com.

KEY QUOTES

"Let your impossible standards crash to the ground. Then pick a few meaningful tasks from the rubble and get started on them today."

"The undodgeable reality of a finite human life is that you are going to have to choose."



WHO

The A Method for Hiring

GEOFF SMART & RANDY STREET

The Big "So What"

Almost every company finds it challenging to find and hire the right talents. The #1 problem isn't about the right strategy, products or processes; it's about finding and putting the right people in the right roles so they can make the right decisions and deliver outcomes that matter. The A Method for Hiring is a proven 4-step approach that you can use to hire A Players in any level of your organization.

Understanding the #1 Problem

Focus on Who, not What

Who vs What. Many leaders focus on the "*Whats*" in their organizations, e.g. the strategies, products and services, systems and processes. However, without the right people in the right place, whatever problems you fix will only resurface again. It's much more critical to focus on the "*Whos*", i.e. having the right people to make the "What" decisions. Once you address the "Who", the "What" will naturally fall in place.

After interviewing many CEOs, leaders and management experts, and then analysing the data in detail, ghSMART found 4 key mistakes that lead to hiring failures at all levels (from a front-line worker to a CEO):

- Lack of clarity on what the job requires;
- Lack of good candidates;
- Inability to choose the right candidate; and
- Losing the selected candidates.

KEY QUOTES

"The most important decisions that businesspeople make are not what decisions, but who decisions."
- Jim Collins

"In business, you are who you hire."

Such hiring mistakes are costly—besides wasting valuable recruitment time and resources, the wrong people can make bad decisions that hurt the company and team morale.

Hiring the Right People with the Right Approach

Most traditional recruitment and interview techniques are ineffective because they don't test if someone can really do a job well. Specifically, there are 10 common approaches that lead to poor hiring decisions—ghSMART calls them "voodoo hiring methods".

- The *art critic* uses gut instincts to make quick (and often inaccurate) decisions.
- The *sponge* allows everyone to interview every candidate, resulting in wasteful duplication.
- The *prosecutor* tests candidates' knowledge with quizzes and questions (which don't really correlate with performance).
- The *suitor* is obsessed with selling the job rather than evaluating the candidates.
- The *trickster* uses tricks to test the candidate (e.g. leaving things on the floor to see if the candidate would pick it up).
- The *animal lover* asks questions like "if you were an animal, what animal would you be?"
- The *chatterbox* wastes time on small talk.
- The *personality tester* makes decisions based on psychological/personality tests, which may not predict job success.
- The *aptitude tester* tests for aptitudes (e.g. persistence) which may be relevant but are inadequate for decision-making.
- The *fortune teller* asks hypothetical questions which won't tell you what the candidates would *actually* do.

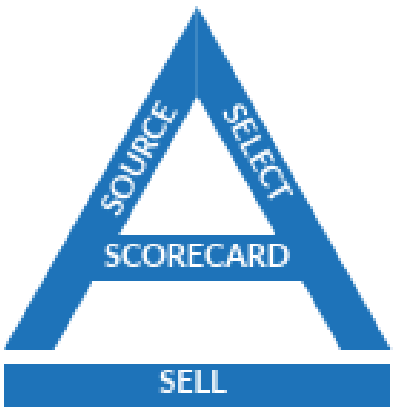
KEY QUOTES

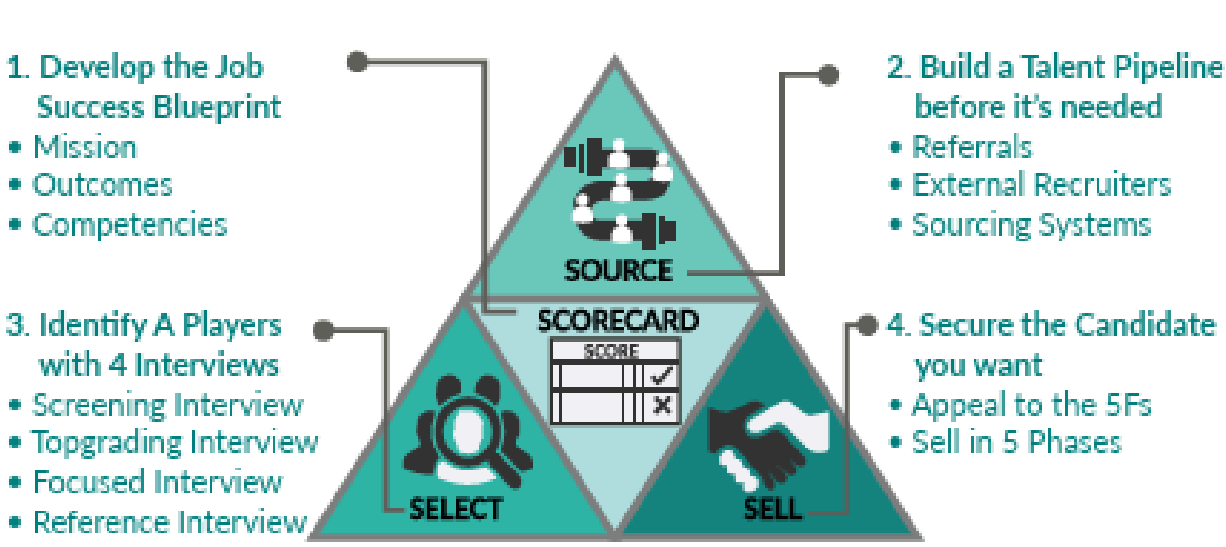
"One of the painful truths of hiring is this: it is hard to see people for who they really are."

Ultimately, you want to hire A Players who fit with your company culture and can accomplish a specific job with high standards. ghSMART defines an A Player as "a candidate who has at least a 90 percent chance of achieving a set of outcomes that only the top 10 percent of possible candidates could achieve". The question is: how can you find, identify and successfully hire these A Players?

The 4-Part Approach for Hiring A Players

The ghSMART A Method for Hiring is a simple, proven 4-step process to identify and hire A players at all levels of the organization. In the book, the authors used the strokes of the alphabet "A" to present the 4 components. We have used a different graphical representation in this summary.





Scorecard: Developing your Success Blueprint

You can only build a house with a blueprint. Likewise, you can only hire the right person with a scorecard. The scorecard is a job blueprint—it describes exactly what success in a role looks like, including the (i) mission (*why* the role exists), (ii) outcomes (*what* the person must deliver) and (iii) competencies (*how* the job should be done given the job requirements and company culture).

Mission = the job's essence or core purpose.

KEY QUOTES

"Hiring A Players takes hard work...You have to dig hard, ask tough questions, and be prepared sometimes for disturbing answers."

"Scorecards are your blueprint for success. They take the theoretical definition of an A Player and put it in practical terms for the position you need to fill."

- Keep it *succinct and precise* e.g. "Double revenues from business clients in 2 years by securing new accounts and growing existing accounts." Limit it to 1-5 sentences and avoid vague terms like "maximize shareholder value" or "improve efficiency".

- Don't hire generalists or all-rounders. *Hire specialists* who have the specific, in-depth competencies needed to succeed in a job. It's like how you'd go to a brain surgeon for a brain surgery instead of a general practitioner. This means that the existing managers must get crystal-clear on what's required. For example, are you looking for a visionary leader who can develop new markets, or someone to consolidate and systematize the existing businesses?

Outcomes are what must be achieved to get an "A" rating.

- A job will typically have *3-8 specific, measurable outcomes* e.g. "grow revenue from business clients from $10mil to $20mil by 31 Dec 2020".

- When the targets are *explicit and challenging*, you will automatically weed out the B and C Players and attract A Players with the right skillsets.

Competencies are behaviors that'd fit the job outcomes as well as the company culture.

- Competencies define how a new hire should achieve the job mission and outcomes. You must address *2 sets of competencies*:

  (i) Job-specific skills and behaviors needed to achieve the outcomes; and

  (ii) Cultural competencies to ensure organizational fit (these should appear on every scorecard).

- Based on their research and experience, ghSMART found that most A Players have several *vital competencies* such as accountability, analytical skills, assertiveness, attention to detail, efficiency, honesty, initiative, learning abilities, organization skills, and persistence.

KEY QUOTES

"The mission should help you find not the generalist who points you to the problem but the very best specialist to help you solve it."

"The first failure point of hiring is not being crystal clear about what you really want the person you hire to accomplish."

Scorecard ↔ Strategy. You can't develop great scorecards without first having clarity on your company's strategy and culture. Unfortunately most managers start hiring with only a vague idea of what's required, or using a general/standard job description.

- Start by *crystallizing your strategy and goals*, and translating them into specific objectives and activities for each person in the organization. That's the only way to directly link individual jobs to the overarching strategy.

- A good scorecard should reflect your business plan and the needs of all key stakeholders. All parties should agree on the scorecard and feel excited at the prospect of having someone like that on the team. The scorecard *creates alignment*, lets the candidate know how exactly he/she will be evaluated, and can be used to monitor and evaluate performance after the person is hired.

- The job role/requirements will change over time as the company faces different challenges/opportunities. Thus, a scorecard must be *updated/recrafted* each time you rehire; you can't simply reuse the scorecard. Here's an example of how a scorecard may look like:

BUSINESS SALES DIRECTOR, ABC INC. **MISSION**: Double revenues from business clients in 2 years by securing new accounts and growing existing accounts.	
OUTCOMES	**RATINGS/COMMENTS**
1.Grow revenue from business clients from $10mil to $20mil by 31 Dec 2020. • Add 50 new business accounts with at least $100k contract value each • Grow existing business accounts by 50%, by up-selling and cross-selling the 5 new product lines A, B, C, D and E	
2.Build & lead a team of 15 sales professionals. • Build a hunting team to secure new accounts • Build a farming team to grow existing accounts • Ensure 100% of sales team are A Players • Provide coaching & mentorship for team.	
3.Design and implement sales training for all customer-facing staff by 31 Dec 2019	

KEY QUOTES

"Scorecards translate your business plans into role-by-role outcomes and create alignment among your team, and they unify your culture and ensure people understand your expectations."

"Scorecards...ensure not just that you have A Players but that the A Players are delivering A performances."

"Scorecards need to be evolving documents, not static ones."

"Properly constructed and used, scorecards spread strategy through every aspect of your organizational life."

Source: Building a Pipeline of A Players

Most managers don't plan in advance. When a position opens up, they pull out an old job description and rush to fill the vacancy; a handful of candidates are shortlisted given the limited time and info, and one of them is hired using voodoo methods. Sourcing is about systematically looking for and identifying potential talents *before* you actually need the people.

The best way to find A Players is through referrals, not advertising.

- Get referrals from your *personal and professional networks*. Each time you meet someone who asks you "what do you do?", explain what you do and ask "Who are the most talented people you know that I should hire?" You can also list down the most talented people you know, and approach them to ask the same question. If you deliberately speak with 1 person a week, you'll build a pipeline of potential talents.

- Referrals from *employees*. Your employees know your company well, and can be one of the best sources of new hires. Teach them to ask the sourcing question above, and add sourcing as an outcome on every employee's scorecard. You can also reward or incentivize people for their sourcing contributions.

- Tap on your business network by offering bonuses or gifts to *partners and affiliates* who successfully refer candidates to you.

KEY QUOTES

"Talented people know talented people, and they're almost always glad to pass along one another's names."

"By turning employees into talent spotters, everyone starts viewing the business through a who lens, not just a what one."

You can use external recruiters and/or researchers to supplement your hiring efforts—the main difference is that researchers will only identify potential candidates without qualifying or interviewing them. Help your recruiters to know your company thoroughly—share your scorecards and get their suggestions for improvement.

Once you have a flow of potential candidates, you need sourcing systems (e.g. index cards, software systems) to capture the contacts and follow up with them. The goal is to dedicate time weekly for sourcing, and to keep track of the talents and your conversations with them. Even if they're happy with their current jobs, you can still get to know them and ask if they know other talented people.

Select: Identify the A Players using 4 Interviews

Traditional interview techniques don't predict job performance because they focus on how someone behaves during the interview rather than on their track record. You need a structured approach to gather info and evaluate candidates against the Scorecard. You're looking for A Players who have a history of delivering the desired outcomes, have competencies that fit the role and culture, and are passionate about the role.

The screening interview. Sift out the B and C Players quickly using a short (30-45min) phone-based interview. You can potentially weed out 80-90% of the candidates at this phase, thus saving yourselves lots of unnecessary time and energy later on.

- *Review the scorecard* before the call.
- Start by *setting the right expectations*, e.g. "I'd like to take the first 20 min of our call to get to know you. Then, I'd be happy to answer your questions so you can get to know us. Is that ok?" The idea is to hear from the candidate before he/she is influenced by what you say about the job or company.
- Then, use these *4 key questions*:

  (i) "*What are your career goals?*" Listen for a fit between their personal goals and your company needs, as well as their passion for the things found in or required for the job.

KEY QUOTES

"Talent is what you need. Focus and commitment will get you there."

"Talented people know what they want to do and are not afraid to tell you about it."

(ii) "*What are you really good at professionally?*" Ask them to share 8-12 positive traits with specific examples, so you can understand these strengths in context.

(iii) "*What are you not good at or not interested in doing professionally?*" People may be less forthcoming with this than (ii), so you may need to prod for the real answers. If need be, explain that at the next step of the selection process you'll be asking to speak with references like their former bosses/peers/subordinates, then ask "What do you think they will say you're not good at or not interested in?"

(iv) "*Who were your last 5 bosses, and when we talk to them, how will they each rate your performance between 1-10?*" You only want candidates with scores of mainly 8-10.

- *Tips*:

(i) When people believe that you *will* be talking to their ex-colleagues, they're more likely to respond honestly.

(ii) Stay curious—keep probing for details and clarification by asking "what" and "how" questions (e.g. "what do you mean?", "how did that happen?"). Invite them to elaborate with 3 words—"tell me more".

(iii) Once you have clear picture, invite the candidate to ask questions. If you like what you hear, proactively sell to the candidate using your new insights. If not, shorten the call.

- After the call, ask yourself if there's a *match* with the scorecard given the candidate's goals, strengths and weaknesses. Only bring someone to the next phase if you're truly excited that this could be *the* right person.

The Topgrading Interview. This interview covers the candidate's career in a chronological order, using 5 questions to draw out specific facts and stories about each career phase. By the end of 3-5 hours, you'll have a much clearer assessment of the candidate.

KEY QUOTES

- Start by *setting the expectations* e.g. "We're going to walk through each job you've held, in chronological order, with 5 key questions for each job. After that, we'll discuss your career goals and aspirations, and answer questions you may have. Is this ok?"

- The interview will feel like a natural conversation. If you stay curious and keep using what/how/tell me more, you'll get lots of useful info from the candidate. The *5 key questions* are:

  (i) "*What were you hired to do?*" You goal is to get an idea of what their scorecard would've looked like if they had one.

  (ii) "*What accomplishments are you most proud of?*" Listen out for outcomes related to the job you're hiring for. Beware of candidates who talk about events, people or activities without addressing actual results.

  (iii) "*What were some low points during the job?*" Be prepared to reframe this question a few times to get a real answer.

  (iv) "*Who did you worked with?*" Specifically, ask for the boss' name (and how to spell it), what it was like working with him/her, and what the boss will say the candidate's biggest strengths vs areas for improvement are. When interviewing for a management role, also ask them to rate the team they inherited, the changes they made, whether they hired/fired anyone, and to rate the team when they left it. Make sure you sound like you *will* be talking to these references.

  (v) "*Why did you leave the job?*" A Players tend to leave their jobs for *pull* factors (e.g. being hired by a client/ex-boss or being offered a bigger role). B to C Players tend to be *pushed* out of their jobs (e.g. conflict with their boss/ colleagues, missed targets or having their role reduced).

- *Tips*:

  (i) To keep the interview on point and on time, you'll have to *interrupt* the candidate regularly. The key is to smile and jump in enthusiastically on something they said (e.g. "wow that sounds like an exciting party!"), then bring

KEY QUOTES

the discussion back to point (e.g. "You were just sharing about the new product launch earlier. I've love to hear how that went!").

(ii) Clarify the value of their accomplishment by asking them to compare the results against *3Ps*: the previous year's performance, the plan and their peers' performance.

(iii) Listen out for *pull vs push factors*—don't hire anyone who left ≥20% of their jobs for push factors.

(iv) Keep asking questions until you have enough details to paint a *clear mental picture* of exactly what happened in their previous jobs.

(v) Look out for *subtle cues* that the candidate is lying or withholding info, e.g. shifting in the seat or avoiding eye-contact. Be curious and ask questions till the truth emerges.

The focused interview. This interview takes about 45-60 minutes, and the goal is to dig deeper for info on specific outcomes or competencies in the scorecard. You can also involve other team members, but make sure they follow the recommended script to avoid going off-tangent, e.g. assign 3 interviewers to focus on 2 outcomes and 2 competencies each.

- Always include competencies specific to the job and to the culture. *Set the expectations* for each interview, e.g. "The goal of this interview is to understand more about ____ (state the outcome or competency)."

- Then dive in with *2 questions*:

  (i) "What are your biggest achievements in this area throughout your career?"

  (ii) "What lessons have you learned from your biggest mistakes and what insights have you gained in this area?"

The reference interview. You're now ready to test what you learned about the candidate through reference checks. Never skip this step.

KEY QUOTES

"Keep asking until you understand what the person did and how he or she did it."

- For your reference interviews to be *effective*, (i) pick the references from your interview notes instead of using the candidate's list, (ii) get the candidate to set up the interviews, and (iii) aim for 7 reference checks (ideally 3 former bosses, 2 peers/customers, and 2 subordinates).

- Ask these *5 questions*, using how/what/tell me more to probe deeper:

  (i) "In what context did you work with (the candidate)?"

  (ii) "What were (the candidate's) biggest strengths?"

  (iii) "What were (the candidate's) biggest areas for improvement back then?"

  (iv) "How would you rate his/her overall performance on a scale of 1-10 scale? What aspects of his/her performance led to this rating?"

  (v) "(The candidate) mentioned that he/she struggled with ____ in that job. Can you tell me more about that?"

- Most people don't want to give a bad reference, so you have to listen for *false positives* and what's not being said. Some tell-tale signs include: the use of qualifiers, pauses, "ums" and "ers", or a lack of enthusiasm. A true A Player should call up a genuine sense of admiration and energy in the ex-colleague.

Deciding who to hire.

- Throughout the interview process, *red flags* may surface, e.g. the candidates may speak badly of past colleagues, seem self-centered, avoid talking about failures or find excuses for themselves. Don't ignore these tell-tale signs—keep asking questions and you may be surprised by the truth that emerges. Only move someone to the next phase of the interview if you're convinced they could be the ideal candidate.

- A candidate will have ≥90% chance of success if he/she has both the skills (that match the desired outcomes) and the will (that matches the mission and competencies). After the 4

KEY QUOTES

"Under the pressure of a hiring decision, even obvious clues can slide right past otherwise highly astute people."

"A truly positive reference... should brim with tremendous enthusiasm and obvious admiration."

interviews, complete the scorecards and give each candidate an overall grade of A, B, or C. *Only hire A-graders*. If you have no A-graders, keep sourcing; if you have multiple A-graders then hire the best.

Sell: Secure the Candidate

Your job is not done until the candidate is delivering results as your employee. To get them through the door, you must sell to them by sincerely appealing to the 5Fs that people care about.

- *Fit*. Show the candidate how his/her goals, talents, and values fit with your organizational vision, strategy and culture, as well as the job mission, outcomes and competencies.

- *Family*. Win over the family, especially if a relocation is involved—show them around, have meals with them, and make them feel at ease and excited about the shift.

- *Freedom*. A Players don't want to be micromanaged; they need the freedom to drive their results and prove themselves. Help them believe that they can thrive in your organization.

- *Fortune*. You can rarely win over an A Player just by throwing money at him/her. However, you can link performance objectively to the scorecard outcomes. A Players will be confident of achieving those results and find it fulfilling to earn top dollars for top performance.

- *Fun*. The definition of "fun" will vary with each culture and individual. However, if there's a genuine fit, the candidate should find it fun and enjoyable to take on the job in your company.

In reality, you'll have to sell *throughout* the recruitment process, not just at the end. Specifically, you must sell across 5 phases of the hiring process: during sourcing, during interviews, while waiting for the candidate to accept your offer, after the offer has been accepted, and during the new hire's first 100 days on the job. You can lose the person at any point in this process. Listen for concerns regarding the 5Fs and address them immediately. Do your best to maximize your A Player's chances of success.

KEY QUOTES

"Don't fumble the ball as you run across the goal line. You are not finished until your candidate becomes an employee."

"The key to successfully selling your candidate to join your company is putting yourself in his or her shoes. Care about what they care about."

Conclusion

Implementing the A Method for Hiring

Hiring A Players takes deliberate effort, hard work and persistence. However, the results are worth it, since the right talents will influence/shape your company culture/direction and define your long-term success. Eventually, your goal should be to build an A-team, i.e. a team of A Players, each with their own strengths suited for a specific role.

You don't have to be a CEO to use the A method of hiring—it can be applied at any level in an organization, be it a department, business unit or a function.

Other Details in the Book to Look out For

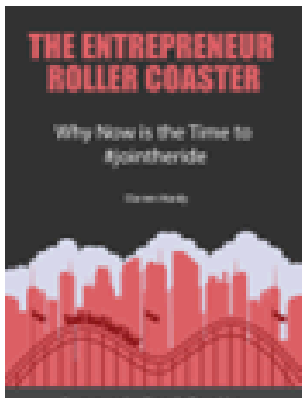
This is a clear, structured guidebook to hiring A Players. Besides the highlights in this summary, the book includes many other tips and insights, including: red flags or behavioral warning signs to look out for, 10 things required for installing the A method, legal traps to avoid, and numerous examples with specific scripts and phrases to help you get the most from your hiring process. For more details, please visit https://whothebook.com/.

About the Authors

Geoff Smart (born 1972) is an entrepreneur, speaker and author. He's the chairman and founder of ghSMART, a leadership advisory firm that helps companies with hiring, developing and leading talented teams. In 2017 and 2018, Forbes named ghSMART as the best management consulting firm in its industry segment based on surveys of business leaders.

KEY QUOTES

"Collectively, (A Players) form an A team because they know how to pull the oars together. They propel your business forward by making unique contributions that add up to something greater than the sum of parts alone."



THE ENTREPRENEUR ROLLER COASTER

Why Now is the Time to #Jointheride

DARREN HARDY

The Big "So What"

Most people have no idea how to start a business nor what to expect. This is a guidebook that explains what it takes to start a business and how to prepare yourself for the ups and down of the entrepreneurial roller coaster ride. It offers useful insights for anyone deciding whether to start a business, or who wants to maximize his/her chances of success in business.

Introduction

Today, there are more opportunities than ever to start your own business. Technology has opened up new possibilities for individuals and small businesses which were previously available only to big corporations. In the last decade, global wealth has increased by 69% and there's been a spike in the number of new millionaires. Hardy urges you to grasp the opportunity and join the ride.

Hardy started his first business when he was 18 and earned $20,000 a month by the age of 19. Although he has built several successful businesses—from door-to-door sales to real estate, online media and educational software—he has also made his share of mistakes.

In the book, he shares many stories and anecdotes from his own experience, as well as insights gained from interviewing top leaders and business magnates when he was the publisher of the SUCCESS magazine. The book is organized into 8 key chapters, with recommended action steps at the end of each chapter to be completed with free downloadable worksheets. In this summary, we've integrated the ideas from the book with key action steps from the worksheets.

KEY QUOTES

"This book is about helping you embolden that fiercely independent and powerfully self-reliant spirit that already resides inside you."

"This is what business is like...a frightening, exhilarating, and totally addictive thrill ride."

Meeting the Minimum Requirements

You need to be of a minimum height to get on a roller coaster. Likewise, there are 3 minimum requirements to succeed in business.

Find your Love/Passion

The entrepreneurial journey will be tough. Without love or passion, it's hard to stay the course. Passion is something that's already inside you and just needs to be switched on.

Your first role is to identify your switch, by considering 4 areas:

- *Loving **what** you do*. In reality, we can never be passionate about *everything* we do. What we see of someone's work is usually just a fraction of what they really do. We may see celebrities in the movies and on the red carpet, but we don't see the hours spent on casting, negotiations, research, meetings, makeup, traveling etc. Only 5% of our work is likely to be what we love; the other 95% is work that we *don't* love. Moreover, many of our passions are merely hobbies and can't be applied to our work.

- *Loving **why** you do it*. If you can find the outcomes that you can fall in love with (the "why"), you'll find it easier to bear with the 95% of the work you dislike. Hardy is driven by his passion for empowering entrepreneurs and helping people to achieve their desired results and success.

- *Loving **how** you do it*. Even the most mundane job—be it housekeeping or administration—can be motivating when you aim to deliver it to the highest standards. Bring excellence and passion to your work and people can't help but notice you.

- *Loving **who** you do it for*. You may also love your work because of the people who benefit from it, e.g. your loved ones or members of a community you care about.

KEY QUOTES

"Passion is like electricity in a light switch. It's always there...ready to be turned on."

"Don't over-romanticize the idea of being wholly passionate about what you do...Nothing is awesome all the time."

"Work is gonna suck 95% of the time. But that other 5% is freaking awesome!"

"The two most important days in your life are the day you are born and the day you find out why."
- Mark Twain

Find your Fight

We are driven by the pursuit of pleasure or the avoidance of pain. An "enemy" like injustice or poverty can trigger feelings of fear or anger which are powerful motivators. The key is to find something that fires you up and gives you the emotional drive to succeed in business.

Find your Strength

To succeed, you need more than sheer motivation. You must also identify unique advantages that will help you succeed in business. Over the years, Hardy discovered that his unique strength lies in his communication skills, and the businesses that thrived were those that tapped on his strengths.

Strength Training. After studying and interviewing many successful people for the SUCCESS magazine, Hardy found that success has nothing to do with your DNA or background; it's a result of mastery that comes from persistent hard work.

- The "10,000 Hour Rule" popularized by Malcolm Gladwell says that mastery comes from about 10,000 hours of *deliberate, focused practice*. Top performers in any field—from music legend David Foster to famous basketballer Michael Jordan—all attain mastery after years of repeated practice and learning. However, passion gives them an added boost to keep pushing for improvements and new heights.

- Don't let anyone tell you what you're born or not born to do. Only you yourself can *choose where/how to invest your efforts*.

Action Plan

Identify your Passion. Consider what you love about your current job/ business in terms of what, why, how and who. If you don't love anything about your current vocation, then consider what you'd do if you already had all the money you want, what makes you feel most alive and fulfilled (and why), and who you'd trade places with professionally (and why).

Find your Fight. Consider what enemy is keeping you from what you love or care about. What are you willing to fight for?

Find your Strength. Consider what areas you stand out in, and what you do relatively effortlessly compared to others. Identify ways to build those strengths.

KEY QUOTES

"The reality is love and hate are the same thing—just looking in different directions."

"DNA has nothing to do with success. Turn your genes into overalls and get to work."

"Everyone has talent, but ability takes hard work."
- Michael Jordan

Get Ready (Buckle Up)

One of the most challenging things about entrepreneurship is the amount of rejection and ridicule that you'll face. Even those closest to you may discourage you, tell you that you're crazy and try to convince you to follow the conventional path. Realize that the rejection is not about you; it's about them because you remind them of what they themselves dare not do.

Use these 5 strategies to crush these negative voices:

- *Don't be likeable.* When you create change and rock the status quo, it upsets people. Stop worrying about what others think about you and don't let their opinions hold you back. Treat disapproval and dislike as a sign that you're on the right track, rather than a sign of rejection or failure.

- *Get laughed at.* When revolutionary ideas like SpaceX and Disneyland were first conceived, people laughed at them. Arnold Schwarzenegger (an Austrian) faced his share of ridicule when he said he was going to become a big movie star in America, and again when he said he was going to become a governor in California. When people mock you, treat it as a sign that you have a truly original idea.

- *Define success in your own terms.* Most of us spend our lives trying to live up to others' standards. Hardy himself spent much of his life trying to gain his dad's approval, before he learned to define success on his own terms. Consider what real success means to you, what would bring you true happiness, joy and fulfillment, and how you'd measure it. Write it down.

- *Realize most opinions don't matter.* Most of the time, others are more interested in how you make them look, than in you or your idea. Before you allow yourself to be dragged down by someone's negative opinion of you, consider if that opinion really matters—will the person cry at your funeral or even attend it? The answer is probably "no".

KEY QUOTES

"People don't resent you for being brave. They resent themselves for being afraid."

"When you step outside the status quo, you become a giant mirror for those who stay, reflecting back their cowardice."

"If no one is ridiculing or laughing at you, you either don't have a revolutionary, change-making idea yet, or maybe you've been afraid to finally share it with the world."

"Don't let the noise of others' opinions drown out your own inner voice, heart, and intuition."
- Steve Jobs

"We all get knocked down. How quickly we get up is what separates us."

- *Shorten your recovery time*. So long as you're pushing yourself outside your comfort zone and trying/learning new things, you'll inevitably fail. In fact, you'll probably face repeated setbacks. Know that it's expected, give yourself some time to recover, then move on. Remind yourself that being rejected and knocked down are signs that you're growing and improving.

The surest way to fail is to quit. Crush the naysayers and persevere to achieve success on your own terms.

Action Plan

- Identify the **people holding you back** and apply the strategies above.
- Identify and write down your own **definition of success**

Power Up

As an entrepreneur, you'll find that there's way too much to be done in too little time. To get results, you must focus on the right things.

Know your main priority: Sales

The best businesses aren't the ones with the best products, star players, nor outrageous margins. 90% of the time, it's all about having great sales and marketing. Apple's iPod didn't take off until 3 years after its launch, because it changed its approach and convinced people that everyone should have "1,000 songs in your pocket".

No matter how big or small your business is, your #1 job is to sell.

- Many people find sales scary and try to hide behind other tasks on their to-do list. However, there's simply *no hiding from it*. Without sales, you have no business.

- Besides selling to customers (directly or via your sales team), you must also *sell your vision* to internal and external stakeholders, convince the *right people* to join you and give their best etc. You must sell to everyone, every day.

KEY QUOTES

"It is precisely in those moments of strife, struggle, and failure...that the true achievers are born."

"The ultimate success of a product or service is 10 percent product quality and 90 percent sales."

"You're going to sell. All day. Every day. That's business."

The good news is, all of us are natural salespeople. As babies and kids, we intuitively "sell" to adults to get what we want, be it crying or turning on our charms. Yet we convince ourselves as adults that we can't sell. Learn to build your sales muscles with these 9 steps.

- Don't think of your prospects as targets, as if they're on your hit list. Instead, think of them as *people you're going to help*. This simple switch in framing changes your entire sales approach to focus on what *they* want and how you can help *them* get it.

- The most vital ingredient of effective sales and marketing isn't conviction, passion, or even persistence. It's empathy. Take the time to *put yourself in their shoes* and feel how they feel. When you truly understand your customers, you'll use language that reflects who they are, who they aspire to be, and what they seek to do.

- In sales, the only need that matters is the *perceived need of the customer*. It's a common mistake to try and fill a need you think needs to be filled. Stop talking, pushing, pitching and assuming; instead, ask questions, probe for details, listen more and seek to understand your customers' perceive needs.

- Don't use a one-size-fits-all approach for everyone. To *find the hot button for each customer*, you must first connect with the customer by asking the right questions, then connect their desire or hot button with the solution you have.

- Don't do cold calls. Instead, find a *"relationship bridge"*, or someone credible who can introduce or refer you personally to your desired client.

- Don't sell to one person at a time. *Sell in bulk* through influencers who have a ready network or access to customers.

- *Make an impression by being shocking and awe-inspiring*. When Hardy was in real estate, he'd show up at the prospects' doorstep on the morning their listing expired, and asked that they list with him. For 2 weeks, he'd follow up daily with a series of cheesy-but-memorable actions, e.g. sending a package of combustible materials and explain why he was

KEY QUOTES

"Want to sell more? Stop selling. Help instead."

"Sales is filling a customer's perceived need, not your need to sell something."

Da-Bomb, or having an assistant deliver a "SOLD" sign which they'd need if they hired Hardy. Such an aggressive approach may turn off a minority of people, but it gets the attention of the remainder.

- *Focus 90% of your efforts on 10% of your best clients*; They love what you offer, buy more and buy more frequently, are a joy to serve and tell their friends about you. Identify your best clients using these 3 criteria: (a) *they're easy to reach*, (b) have the biggest, most evident *perceived need* and see the value of what you offer and (c) *are profitable* (with a higher lifetime value in terms of the size and frequency of purchases and referrals).

- *Find your Dream 50*, i.e. people or organizations who can bring you millions of revenue if they buy into your product or service. Just securing a few of such relationships can transform your entire business.

Action Plan

Assess & re-prioritize your strategic focus. Rate where your business stands for each of these strategic areas: product/service, leadership/management, margins, sales & marketing. Identify the *% of your time* currently allocated to each of the areas above. Identify how you'd *reallocate your time* to reflect that 90% of your business success will come from sales and marketing.

Find & capture your Dream 50 using the sales strategies above. *Identify* and list your Dream 50 customers. *Put yourself in their shoes* to consider their worries, fears, desires, goals, hopes and needs. *Customize your solution* to their unique pains, hopes and desires and consider how you'd show that you can give them what they want. Identify the *relationship bridges* to get introduced. Then go all out to *shock and awe* them.

Fill your Empty Seats

At some point, your coaster (or business) is going to take a plunge. Would you want the people riding with you (your team) to be fearful and paralyzed, or excited and ready to take on the challenge? Unfortunately, entrepreneurs tend to get so excited by people who love their ideas/vision that they overlook their skills/experience, or they try to hire people to put out fires rather than to bring their vision to life.

KEY QUOTES

"The key to greater profits is rarely capturing more clients. (It's) capturing more valuable ones."

"You can't hire enthusiasm. You need to hire evidence... Hire evidence, not hope."

Hire only A-Players

You must hire people who already have the right skills, character and experience (and can show evidence of that).

- For an average business, 65-80% of the operating costs go toward staff wages. You simply *can't afford to hire the wrong people*, since the real costs include not just their salaries, but also the mistakes and missed opportunities.

- As a busy entrepreneur, you also don't have the time to *train people from scratch*.

You should only hire A-players (not B-players or C-players) because they make your work easier, improve your business and free you up to do what you need to do as the owner. More specifically:

- *A-Players attract other A-players*. Having the right people on your team can be the best recruiting tool.

- *A-Players are winners*, and it's your people (not your products and systems) that will shape your company.

- *A-Players pay for themselves*. Don't worry about paying more—someone who earns $250,000 a year but brings in $5 million revenues for your company is effectively free.

Build a High-Performance Culture

You can't dictate or shape your company culture; you can only hire people with the attributes desired for your culture. Be personally involved in the hiring process and do these 3 things to recruit effectively:

- *Know what you want*. You're looking for A-Players who're (a) better than you and can deliver what you can't, (b) have the character traits needed to succeed and form your desired culture (e.g. discipline, friendliness), and (c) can fall in love with what they'll be doing in your company.

KEY QUOTES

"The single most important thing you need to do is pick the right people and keep them. There is NOTHING more important than this."
- Jim Collins

"Your business will only be as good as the people you recruit to join it."

"A great person in the wrong environment is still the wrong person."

- *Know what they want*. Generally, people look for 5 things in their work: the ability to work with other great *people*, being part of a meaningful *challenge* (or purpose), having the *opportunity* to move up or progress in their career, the ability to *grow* and become more of who they want to be, and being fairly *compensated* for their contributions. Realize that money is just 1 of the 5 components.

- *Make it fun*. Having fun at work doesn't always mean playing billiards or having free meals in the office. When the 5 factors above are met and people are excited about what they do and who they're working with, work can be fun and fulfilling.

Action Plan

Take stock of the top 5-10 key positions, competencies and skills you need to become the market leader. Assess if your current people in these roles are A-Players, i.e. better than you in their roles, have the desired traits for your culture and are in love with what they're doing for your business. Identify the positions that must be upgraded.

Define what you want, including the role, job description, how success will be measured, the results you're paying for, and the attributes, competencies, character or qualities required.

Define what you can offer in terms of: people, challenge, opportunity, growth, money and fun.

Take the Front Seat

In any organization, the quality of its leadership determines its performance. As the leader, you must bear 100% responsibility for *everything* that happens in your organization—share the credit but own the blame.

To be effective in the 21st Century, leaders must:

- *Lead by example*. People watch what you do, not what you say. Lead from the front so people can follow you, never ask others to do something unless you've done it yourself, and act as if *everything* you do—from being late for a meeting to gossiping about a colleague—is being watched by others.

- *Be willing to do what's right/necessary*, even if it's unpopular.

KEY QUOTES

"What makes work fun is doing meaningful work.
- Cody Foster

"The number one bottleneck or constraint to the growth of any organization is the leader."

"Only ask for others to do what you have done yourself first."

- *Bring out the best in your people*. Encourage every member to contribute, facilitate engagement and co-creation, and help people to grow and thrive by removing fear, nurturing positive attitudes and beliefs, and investing in their personal growth.

- *Let others lead*. When you first start a business, you must do everything from sales to customer service and accounting. Aim to grow sales to a point where you can hire specialists to handle each function, so you can increasingly focus on leading.

- *Know when to let people go*. As your business grows, you may find that certain roles have outgrown the people currently doing them. Be prepared to redeploy or even let people go if they can no longer pull their weight or no longer fit.

How you think and act as a leader affects others, and it's vital to set the right example. However, we tend to think that we're better than we really are. Develop yourself and your team members using the action plan below.

Action Plan

Improve your leadership. List down 20-30 important attributes you want in your team (e.g. discipline, drive, empathy). Then, select the 12 most vital attributes and plot them in the Leadership Development worksheet (download it for free here). Rate yourself (from 1-10) on how well you exemplify these attributes daily. Get at least 3 other people to rate you on the 12 attributes, then compare the scores and identify your areas for development.

Improve your team. Rate your top 5 leaders on the 12 attributes, get them to rate themselves and you, compare notes and discuss their development plan.

Do a re-evaluation every 90 days to track your progress. The goal is to eventually score 10 on all 12 attributes.

Pick Up Speed

As your business grows, you must become increasingly productive without being overwhelmed. Just like how doctors use vital signs (e.g. heart rate and blood pressure) to assess your health, you need to focus on 4 vital factors to manage your business for success.

KEY QUOTES

"You can't be a great leader if you spend your time doing tasks that aren't actually leadership."

"Every endeavour that you do has a few vital functions. All you have to do is figure out what they are and become excellent at them."
- Dr. Mehmet Oz

1. Your Vital Functions

Every job or junction has a few key things that matter the most. Track how you're spending your time in the day, then work on increasing the amount of time spent on your vital functions.

Know your value. Calculate your hourly rate (personal annual income divided by annual work hours). Every task that you can hire for less than that hourly rate must be delegated or deleted. If you earn $200,000 a year and work 2,000 hours, each hour of your time is worth $100 and should not be spent on work worth less than that.

Identify your top 3 vital functions/roles, then zoom in on the #1 vital function which only you can do, which you do best and contributes the most to your organization. Then, cut down everything that's not vital to free up time to focus on your #1 function. Track, measure, and master the skills needed to excel in this function.

2. Your Vital Priorities

These are the tasks you must perform well to accomplish your vital function. List down all your priorities (to-do items, key projects), narrow down to the top 3 priorities and say "no" to everything that doesn't contribute significantly to these 3 priorities.

3. Your Vital Metrics

Your metrics help you to know if you're on-track or off-track so you can do course-correction.

List down 5-6 key metrics that make up the economic engine of your business and reflect your progress (e.g. # new customers) then identify the drivers behind these metrics (e.g. visits to store, new database opt-ins).

Use the "Massive Transformation Formula" (MTF):

- Identify the *Big 3 goals*, which if achieved, will make this year the best year of your life. Throw the other goals away.

KEY QUOTES

"Just do the vital functions (amazingly well) and build a great team who are excellent at the rest."

"Activity is not productivity."

"Decide on a few critical things, do them more often, then get better at them."

- Identify the *1-2 key habits* that'd be most crucial to achieving your Big 3 goals. Repeat them until you form the habits.

- Take 30 seconds daily to *track and review* how far you've achieved your Big 3 goals and key habits. Make adjustments and make up for the difference if needed.

4. Your Vital Improvements

To improve, you must go beyond learning and spend more time doing. Achieve significant and lasting improvements using these 3 steps:

- Identify the skills that are most vital to your Big 3 Goals;

- Commit part of your time and income to invest in yourself, e.g. attend a program or get a coach/advisor; and

- Rinse and Repeat. When you find something/someone that works for you, rinse and repeat to deepen the learning.

Action Plan

Calculate your **hourly rate**; delegate/delete everything that's worth less.

Define your **4 vital factors** and get your team members to do the same.

Formulate your **MTF** and get your team members to do the same.

Hands in the Air

Entrepreneurs are not fearless risk-takers. Everyone feels afraid at some point and it's all about facing your fears.

Use these 6 brain hacks to conquer your fears:

- *Realize that fear is not real*. It's merely an illusion that arises from how our brains interpret something. The next time you're held back by your fear, ask yourself, "will this kill me?". The answer is probably "no".

- *Don't fear your fear*. Often, the anticipation of doing

KEY QUOTES

"The brave man is not he who does not feel afraid, but he who conquers that fear."
-Nelson Mandela

"The fear itself hurts more than the thing you are scared of."

something already evokes fear and such pre-fear can be even more damaging that the thing that you fear.

- You don't need to be brave all the time to succeed. You just need *20 seconds of courage*, 3x a day, to do the things that'll make a difference, e.g. to say "no" or call your dream client.

- We tend to imagine the worst possible scenarios of how things can go wrong or how we will fail. *Focus on the task* and do it well; don't fret over imaginary outcomes.

- With enough practice, you can *habituate yourself to fear*, e.g. feel less fearful calling a prospect or stand on a public stage.

- *Make failure fun, not scary*. Massive failures can be the source of some of your most valuable lessons. Make a game of it: try to out-fail yourself and your competitors. It will involve lots of humiliation and pain initially, but these will eventually give way to results.

Action Plan

List down your fears and identify the **top 3 fears**. Ask yourself, will you die from it, how can you habituate it and make it fun.

Take 20s, 3x a day, to **tackle your fears** daily.

Smile for the Camera: Don't Miss the Point

In the pursuit of your goals, don't lose sight of what matters most.

Hardy shares several dos and don'ts to ensure you enjoy the ride:

- Don't follow others' path or their model of success. Define what *you* want, *follow your own path* and enjoy the journey.

- A bigger business may not always be better for you. Consider what you want at the *end of the journey* (e.g. health, freedom, love etc.) and do/track the things that'll get you there.

- Don't get distracted along the way or get discouraged by what others say. *Stick to what matters most*.

KEY QUOTES

"The activities you are most afraid of are the activities that can cause a breakthrough in your success. Step into them."

"The key to success is massive failure. Go fail!"

"Getting to the end of the ride is not the point. Being a successful rider isn't the point either. The point is enjoying the ride."

- *Trust your gut*. If you're unsure whether to pursue something, ask yourself if you'd look back when you're 80 and regret not doing it.

Use the action plan below to get clear on what matters most.

Action Plan

Identify your point. Write down WHO and WHAT you value the most. Ask yourself honestly if you're allocating most of your time and energy to these people/ priorities; if not, identify what will you do to change it.

Start with the end in mind. Write your obituary using the template provided online: consider how you want to be remembered, and start living that life today.

Identify your regrets. Ask yourself: If you died today, what would you regret and how can you prevent those regrets from becoming a reality?

Other Details in the Book to Look out For

This book is written like a workbook, and the tips are meant to be applied. You can supplement the key ideas in this summary with more examples/stories from the book and/or download the free worksheets at www.RollerCoasterBook.com/Resources.

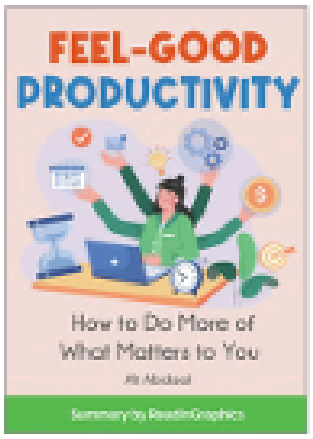
About the Author

Darren Hardy is an American author, keynote speaker, advisor, and former publisher of SUCCESS magazine, with more than 20 years of experience in the personal growth and success industry. He has led three success television networks producing over 1,000 TV shows with famous thought leaders.

In December 2015, Hardy announced his decision to leave Success magazine as publisher to focus on new opportunities including speaking engagements, media appearances and private mentoring. Find out more about Hardy at www.DarrenHardy.com or access free mentoring tips at his website www.darrendaily.com.

KEY QUOTES

"Don't miss the point. Spend your days pursuing the things you want said in your eulogy."



FEEL-GOOD PRODUCTIVITY

How to Do More of What Matters to You

Ali Abdaal

The Big "So What"

Feel-Good Productivity is a fresh approach to productivity. It seeks to achieve more not by pushing harder, but by feeling better. In this book, Ali Abdaal shares how to harness positive emotions to boost your energy, find fulfillment, and achieve more of what matters in a sustainable way.

What is Feel-Good Productivity?

Abdaal initially relied on hard work and discipline to complete medical school. However, as a doctor, he found traditional productivity methods to be unsustainable. He started to question conventional productivity, research alternatives, and eventually developed Feel-Good Productivity—an approach that focuses on feeling good to achieve more, rather than relying on constant discipline and hustling.

- This shift helped Abdaal to feel more positive and productive at work, and refocus on what truly mattered. Eventually, he left medicine and became an author and YouTuber.

Why Feel-Good Productivity Works

The Broaden-and-Build Theory by psychologist Barbara Fredrickson explains why feeling good can help us become more productive, resilient, and effective at problem-solving. Positive emotions can:

- *Broaden our awareness*, allowing us to see more possibilities and solutions; and

KEY QUOTES

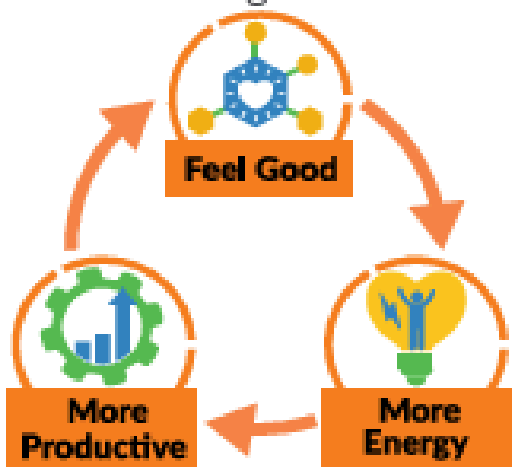
"Success doesn't lead to feeling good. Feeling good leads to success."

"Positive emotions are the fuel that drives the engine of human flourishing."

"By understanding and applying what makes you feel good, you won't just transform your work. You'll transform your life."

- *Build mental and emotional resources* over time, giving us the resilience and social bonds to thrive in the long-term.

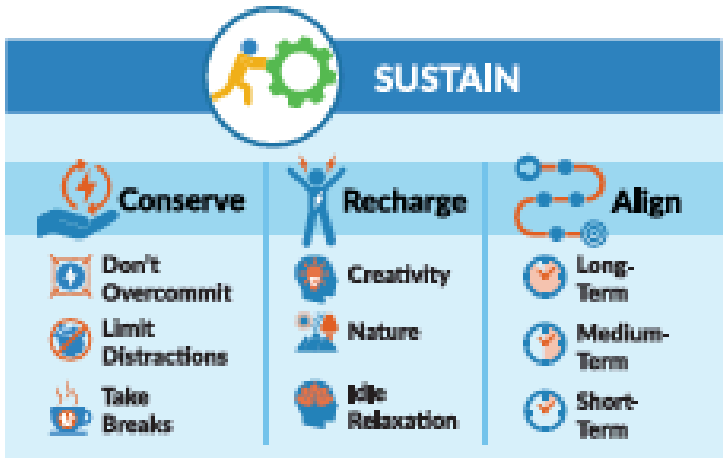
Feel-good productivity works for 3 main reasons:



- Positive emotions release feel-good hormones (endorphins, serotonin, dopamine oxytocin) that *boost our energy and motivation*.
- Positive emotions also *reduce stress* by mitigating stress responses and restoring calm after stressful experiences. This enhances resilience and well-being.
- Research shows that happiness doesn't come from success, but the reverse. People who nurture positive emotions exhibit higher creativity, productivity, and *fulfillment*. They're more likely to excel, build strong relationships, and achieve long-term success.

Feel-Good Productivity aims not just to do more, but to achieve what matters most, balancing productivity with a fulfilling life. This book serves as a guide and toolkit to help you apply the philosophy to your life.

- It is structured in *3 parts*, each containing science-backed strategies and experiments or practices that you can test out in your life.



KEY QUOTES

"What's contained in these pages isn't just another productivity system to help you get more done at any cost. It's about doing more of what matters to you. It'll help you learn more about yourself, what you love and what really motivates you."

"This book isn't a to-do list. It's a philosophy–a way of creating your own personalised productivity toolkit."

Part 1: Energize

To use positive emotions to energize yourself, integrate 3 "energizers" into your daily life: Play, Power and People.

Play

Play isn't just for kids; it's also a powerful tool for adults to recharge and gain new ideas. A playful mindset relieves stress, provides fresh perspectives, and reconnects us with our curiosity.

- For example, *Richard Feynman* was facing burnout after years of intense work. One day, he became curious about some wobbling plates—this playful approach reignited his passion for physics, eventually leading to discoveries that won him a Nobel Prize.
- You can *incorporate play in 3 ways*: (i) embracing adventure, (ii) finding fun in your tasks, and (iii) reducing pressure.

Embracing adventure: See life as a game, full of surprises and opportunities to be discovered.

- *Choose your character*: Just like role-playing games, you can adopt a playful alter-ego in real-life. Here are 8 "play personalities" identified by Dr. Stuart Brown:
  - *Collectors* find joy in gathering items or organizing activities like a garage sale.
  - *Competitors* enjoy challenging themselves and winning, be it sports, games, or friendly contests.
  - *Explorers* seek out new experiences, from travel to new ideas/perspectives.
  - *Creators* love to make things (e.g. inventions, art, music).
  - *Storytellers* are drawn to narratives and imagination-based activities, e.g. writing or acting.

KEY QUOTES

"Seriousness is overrated. If you want to achieve more without ruining your life, the first step is to approach your work with a sense of play."

"Life is stressful. Play makes it fun."

"Remembering what play is all about and making it part of our daily lives are probably the most important factors in being a fulfilled human being."
—Stuart Brown

- *Jokers* enjoy humor, often making light of situations to bring joy and laughter to others.
- *Directors* love to coordinate people, ideas, or activities.
- *Kinesthetes* delight in physical, movement-focus activities, such as sports and dance.

- Get curious: Research shows that curiosity enhances dopamine release, improving memory and engagement. Ask questions and learn for the joy of learning, not only for maximizing results.

Look for the fun in any task: Any task—even routine ones—can be made fun and enjoyable.

- *Remind yourself to have fun*. Try placing Post-It notes in strategic locations to prompt yourself: "How can this be more fun?" Make mundane tasks enjoyable, like adding music to your work or study sessions.
- Don't fixate on the outcome; learn to *enjoy the process*.
  - Renowned psychologist Mihaly Csikszentmihalyi found that people are more likely to enjoy a task and get in "*flow*" when they immerse fully in the task.
  - Transform mundane tasks into a *personal game*. For example, when storyteller Matthew Dicks worked at McDonald's, he tried creative ways to pitch BBQ sauce to customers, turning an otherwise repetitive job into a fun game.

Reduce the pressure: It's hard to be creative or productive when you're stressed and uptight.

KEY QUOTES

"When you step into the right 'play personality', every day abounds with opportunities to see life as a game, filled with surprises and side quests."

"Being curious about everything not only makes you more creative. It enriches your life."
—Walter Isaacson

"Remember Mary Poppins: there's an element of fun in every task, even if it isn't always obvious."

"With a little creative thinking, you can find joy in any process, however mundane it might seem."

- *Reframe mistakes as "data points"* for learning. In an experiment, students became less willing to try when they were penalized for failures. This shows why we should reduce the stakes of failure.

- *Be sincere, not serious*: For example, instead of trying to give a perfect presentation, focus on sharing your message more authentically. This can make your interactions less stressful, more natural and rewarding.

Power

Power here means personal empowerment, not controlling others. It's about taking charge of the decisions, actions, and habits that shape your future.

- You can *empower yourself* by (i) building confidence, (ii) improving skills, and (iii) taking ownership.

Build your confidence: Your beliefs about your abilities affect both your performance and enjoyment. In one study, participants who believed they were fitter performed better and enjoyed workouts more, even though their fitness levels were actually similar to other participants. To build confidence:

- *Prime yourself for success* by imagining a more confident version of yourself. When you feel unsure, ask: "What would it look like if I were truly confident?" Visualize yourself handling the task confidently and successfully, and use affirmations like "I can do this" or "Almost there."

- *Vicarious mastery*: Observe others who have succeeded in similar challenges. If you're learning rock-climbing, study successful climbers. If you're starting a business, immerse yourself in successful entrepreneurial stories. This provides social proof—if others can do it, so can you.

Enhance your skills through "enactive mastery", i.e. learn by doing.

- *Adopt a beginner's mind* (Shoshin approach): Approach tasks with humility and curiosity. Ask yourself, "How would I do this if I were new to it?" Set aside preconceptions, open yourself to new methods, and remove the fear of failure.

KEY QUOTES

"Failures are only failures when you think they are– and not every problem need be approached with such a straight face."

"No failure is ever just a failure. It's an invitation to try something new."

"'Power' is a scary word, but it doesn't have to be... we simply mean feeling empowered to take your job, life and future into your own hands."

"Confidence isn't something you're born with; it's something you learn."

"Believing you can is the first step to making sure you actually can."

"If they can, you can too."

"Beginners don't hold strong beliefs about what will work, they just try."

"He who teaches learns."
—Seneca

- *Teach as you learn* (Protégé Effect): Teaching others reinforces your learning better than passive study. Ask yourself: "How can I teach others even if I'm not an expert yet?" Guide or mentor those who're a few steps behind you to solidify your learning.

Take ownership of your life. According to the self-determination theory, the more ownership or autonomy you feel, the more engaged and fulfilled you'll be. Even if you can't control the situation, you can control your approach and mindset.

- *Take charge of your processes*: Even if you can't choose what to do, you can choose how to do it. For instance, a teacher may not choose the curriculum, but they can control how they teach. Approach the task in a way that makes it more enjoyable, engaging, and meaningful.

- *Choose a positive, autonomous mindset*. In any situation, you can always choose your attitude.

  - Stop thinking "I have to..." or "Why must I...." as they only amplify negative feelings about the task/situation.
  - Instead, use the words "I choose to..." or "I get to..." This transforms perceived obligations into conscious choices, reinforcing the sense of control over your mindset and response.

People

Our interactions generate relational energy that affects our motivation and performance. People who emit positive energy uplift us, while "energy vampires" drain us.

- To *harness positive relational energy*: (i) find your community, (ii) help others, and (iii) over-communicate.

Find Your Community: Surround yourself with people who inspire you and align with your goals and interests. A like-minded community boosts motivation, creativity, and a sense of belonging.

- *Adopt a collaborative mindset*: See your peers as allies, not rivals. Teamwork isn't just about splitting the work—it's also about mutual support, growth, and being part of a shared journey.

KEY QUOTES

"You don't need to be a guru. You can just be a guide."

"If you can't choose what you work on, you can still choose how you work on it. The outcome isn't always in your hands. But the process, and certainly your mindset, often is."

"There's an extraordinary power to be gained by doing it your way. Even in the most disempowering circumstances."

"Everything can be taken from a man but one thing: the last of the human freedoms–to choose one's attitude in any given set of circumstances, to choose one's own way."
—Viktor Frankl

"There are some people who naturally uplift our energy – the trick is finding them."

"Teamwork is as much a psychological state as a way of dividing up tasks."

- *Create synchronicity* through coordinated activities or shared rhythms. This creates unity and support, and improves both mood and energy levels. Even if you're not working on the same task, you can work in sync, such as working on your own tasks in parallel.

Help others: When we help others, it triggers the release of oxytocin that creates a "helper's high". It also energizes both parties, and strengthens connections.

- *Perform random acts of kindness*: Small acts (like a kind word or getting someone a drink) can brighten someone's day, foster goodwill, and boost your own mood.

- *Ask for help*: Often, we hesitate to ask for help as we worry that we'll impose on others. Yet, research shows that seeking assistance can strengthen bonds and make others feel good. This is called the "Benjamin Franklin Effect," named after how Franklin turned a rival into an ally by asking for a small favor.

  - Start by assuming that people *want* to help. Make requests in person where possible, as it's more effective than virtual requests. Use positive language (e.g. "I admire your work and would really love your opinion on this.") Don't apologize for the request or make it quid-pro-quo.

Overcommunicate. As a rule of thumb, go beyond what you think is the minimum level of communication.

- *Overcommunicate the positives* to deepen bonds and amplify collective energy. Capitalize on good news by:

  (i) Sharing them enthusiastically to uplift others; and

  (ii) Celebrating others' achievements: Show genuine delight, e.g. "I feel so happy for you!" Acknowledge their effort and express optimism for their future.

- *Overcommunicate the negatives*: Be transparent about set-backs or challenges to prevent misunderstandings and to build trust. It's better to be direct and constructive than to sugarcoat or lie.

  (i) Describe what happened in observable, non-judgmental terms, e.g. "We were a week late in project completion" (not "You were irresponsible for missing the deadline.")

KEY QUOTES

"When we work in synchrony with other people, we tend to be more productive. Synchronicity makes us want to help others. And it makes us want to help ourselves."

"By stopping what you're doing and offering help to people at random, you can boost your endorphin levels and help yourself work harder."

"When framed correctly, asking for help makes the person you're asking feel as good as the help makes you feel."

"Not only do we too rarely help others, we also too rarely ask for help."

"When you think you've communicated plenty, you almost certainly haven't."

"Overcommunication won't just inspire them. It will inspire you too."

"When you think you've communicated too much, you probably haven't communicated enough."

(ii) Focus on concrete outcomes, not blame, e.g. "The client lodged a complaint and almost cancelled the contract."

(iii) Provide constructive alternatives, e.g. "Next time..."

Part 2: Unblock

Procrastination stems not from a lack of motivation or discipline, but from Uncertainty, Fear, and Inertia. These feelings cause us to delay decisions or action, which makes us feel worse and procrastinate even more in a vicious cycle.

Seek Clarity (Overcome Uncertainty)

Often, we don't take action because we're unsure of what to do. We're afraid to make the wrong decision, so we keep delaying.

- *Gain clarity by asking: why, what, and when*. Knowing your purpose, goals, and tasks improves focus and motivation.

Ask "why" to clarify your core purpose.

- *Define your purpose* for a task/project. Ask "What's the purpose for this?" and craft a statement of purpose to guide your actions. For example, are you exercising to attain 6-pack abs, or to have a healthier and more balanced lifestyle?

- *Ask why 5x* to peel back layers of surface motivations and find your real purpose. For example, "Why am I doing this project?" Because it's work. → "Why do I work?" To earn money. → "Why do I earn money?" etc.

Ask 'What?" to shift from vague, outcome-based goals to specific, input-based goals.

- *Set NICE goals*. Set immediate, achievable goals that are:
  - Near-term (daily or weekly);
  - Input-based (things you can do immediately);
  - Controllable; and
  - Energizing.

KEY QUOTES

"To tell the chronic procrastinator to just do it would be like saying to a clinically depressed person, cheer up."
—Joseph Ferrari

"All too often, we approach procrastination by treating the symptoms rather than the underlying causes. And all too often, those causes relate to our mood: when we feel bad, we achieve less."

"Asking 'why' repeatedly reminds us of what we should really be focusing on–and allows us to home in on it."

"You might know what your ultimate 'why' is; but without a clear end-goal, you'll struggle to work out how to get there."

Unlike SMART goals which focus on outcomes (e.g. "Write a novel in 12 months"), NICE goals focus on the journey (e.g. "Write for 20 minutes daily").

- *Do a pre-mortem*: Envision what could go wrong with your project (e.g. missed deadlines, technical issues) and brain-storm solutions to address such issues upfront.

Ask "when" to clarify when to act and how to create positive habits.

- *Use implementation intentions* (or habit stacking) to pair a specific action with an existing routine, e.g. "After breakfast, I'll review my goals." This creates a mental association between the new task and a daily habit, making it easier to build new habits.

- *Use time blocking* to allocate specific time slots for specific tasks, so you take charge of your time and energy instead of reacting to external demands. Block your time at 3 levels, then adapt as you go along.

  (i) Commit time for *specific tasks* that you've been avoiding.

  (ii) Organize the bulk of your *day* into time blocks, e.g. assign time in the mornings for focused work and afternoons for administrative tasks.

  (iii) Plan out your entire *week* to ensure that you've set aside time for your key priorities such as work, family, exercise, personal growth, hobbies, and relaxation.

Build Courage (Overcome Fear)

Fear is triggered in the brain's amygdala when it perceives a threat. Such perceived threats—such as the fear of rejection or fear of failure—are seldom dangerous, but they make us so anxious that we can't think clearly or take productive action.

- *The key is to move forward despite fear*—to face it with courage rather than avoid it. You can do so by (i) identifying your fear, (ii) diminishing it, and (iii) rising above it.

Identify your fears: Once you understand the specific fears holding you back, it's possible to tackle them constructively.

KEY QUOTES

"Forget SMART goals. What you need are goals that feel NICE (near-term, input-based, controllable and energising)."

"If you don't know when you're doing something, chances are you won't do it."

"Structure gives you more freedom, not less...you're designing your life according to your priorities."

"Time blocking isn't about creating a rigid schedule that stresses you out; it's about providing structure and ensuring there's dedicated time for what matters most to you."

"It isn't lack of talent or inspiration that's holding you back. It's fear."

"Find courage. To look at our fear, acknowledge it, and move past it."

For example, Abdaal procrastinated for 7 years to start his Youtube channel—once he realized he was delaying due to a fear of failure, he managed to push through the fear.

- *Name your fears* to reduce their intensity and build the self-awareness needed to move past them. In a study on phobias, participants who labeled their fear felt calmer and better equipped to face the object of their phobia. By contrast, the more you avoid something, the scarier it seems.
    - Ask yourself: What am I afraid of? Where is this fear coming from? Is it based on fact or perception? Are you doubting your abilities or worrying about others' opinions? Understand the fear to move past it.

- *Shift your self-identity*: We hold ourselves back with labels like "I'm not a good presenter" or "I'm just not adventurous." To encourage new behaviors, change limiting labels (e.g. "I'm a perfectionist") to empowering ones (e.g. "I'm a learner").

Diminish your fears: Often, we amplify a fear by imagining worst-case scenarios that are unlikely to materialize. You can do the reverse—put the fear in perspective to reduce its intensity.

- *Use the 10/10/10 Rule*: Consider how much the feared outcome will matter in 10 minutes, 10 weeks, or 10 years. For example, you might realize that being rejected for a job doesn't really matter in the long term.

- *Start taking baby steps* to build confidence; don't wait to feel confident before you start. Ask yourself: Can I start even I'm not confident? Most of the time, it's ok to start with small, imperfect steps, then slowly improve over time.

Conquer your fears: It's impossible to eliminate all fears. However, we can rise above the fears and push forward *in spite* of them.

- *Reduce self-focus*: The "spotlight effect" happens when we overestimate how much others are focusing on us. The next time you fret over what others think about you, remember that people are too focused on themselves to notice if you made a bad joke or if you're wearing mismatched socks. Even if they notice, no one really cares.

- *Adopt an alter ego*: In a study, children who imagined themselves as superheroes became more focused,

KEY QUOTES

"The solution isn't to get rid of fear...it's to develop the courage to face up to it."

"Knowledge is power. Getting to know our fears is the first step towards overcoming them."

"Labels are...tools that help us make sense of who we are. If we can change our labels, we can often change our behaviour."

"The failures we're worried about now aren't the ones that will always define us. And that the fears we have now won't always carry such significance."

"Make a start. You won't need to get perfect for a long time yet."

"We can't eradicate all our fears. We need to overcome them. That means finding a way to move from fear to courage."

"The truth is, everyone is concerned mostly about themselves...They're not spending much time (if any) thinking about us."

self-controlled, and resilient. This is called the "*Batman Effect*". Leverage this effect by visualizing yourself as someone who's confident and fearless.

- Examples: When Adele was still an inexperienced singer, she overcame her fear of public appearances by creating an alter ego—a blend of Sasha Fierce and June Carter. Ali Abdaal puts on fake glasses and steps into the identity of Charles Xavier whenever he needs to speak publicly.

- What alter ego can you adopt to diminish your personal inhibitions and embody the traits you admire? Before a difficult task, visualize yourself becoming this alternate-you. Reinforce it with affirmations like "I am fearless" or "I am unstoppable."

Get Started (Overcome Inertia)

Inertia is another major cause of procrastination. Newton's First Law states that an object at rest stays at rest, and an object in motion stays in motion unless acted on by another force (e.g. friction).

- In other words, it takes a lot more energy to get started than to stay in motion. It's like riding a bike—it's hard to ride uphill, but once you reach the top the momentum carries you downhill effortlessly. You can *overcome inertia in 3 ways*: (i) minimize friction, (ii) get moving, and (iii) support yourself.

Minimize friction or the effort required to start a task:

- *Modify your surroundings* to make it easier get started on a task. Remove obstacles that add resistance, and make the desired action the default. For example, place your ukulele visibly in the living room to remind yourself to practice, or turn off phone notifications to reduce phone usage.

- *Use the Five-Minute Rule*: When you don't feel like doing something, overcome emotional resistance by committing to work on the task for just 5 minutes. At the end of 5 minutes, you can choose to stop or continue. Often you'll keep going, but even if you stop, you'd have done 5 minutes of work.

KEY QUOTES

"When we embody the traits of a fearless, confident alterego, we can tap into a reservoir of courage and determination that we might not feel our regular selves possess."

"As Newton recognised, it takes way more energy to get started than it does to keep going."

"When you're doing nothing, it's easy to carry on doing nothing. And when you're working, it's much easier to carry on working."

"Even when we know we really should do something, we often find ourselves in places that make it needlessly difficult to get started."

"The best antidote to doing nothing is simply to do something."

Get moving: Focus on concrete, immediate action steps to develop a bias to action. These are more likely to spur you into action compared to overthinking a long-term goal.

- *Define your next action step*: Identify the smallest next step, then act on it. For example, to get started on writing, the smallest action step could be to open a new document on your computer or take out your writing pad.

- *Track your progress daily* using a journal, app, or calendar. Surround yourself with visual reminders of how far you have come and what else you need to do. This motivates you to keep going with consistent effort.

Support yourself: Create personal and social support systems to make it easier to stay motivated and to persevere in the long run.

- Partner with an *accountability buddy* and schedule regular check-ins. This generates relational energy and motivation to follow through. Ideally, find someone who shares your goals, then agree in advance on the ground rules and processes (e.g. check-in times).

- *Practice self-compassion*: If you miss a commitment, don't dwell on it—this only makes you feel bad and procrastinate more. Instead, forgive yourself and focus on the small wins, e.g. "I didn't do X, but I managed to do Y."

Part 3: Sustain

Even if we energize ourselves and overcome procrastination, burnout can still set in when we take on too much, fail to rest/recover, or invest in goals that are misaligned with our true selves. To sustain productivity, we need to Conserve, Recharge, and Align.

Conserve

Overexertion burnout occurs when we try to do too much too quickly. Think of it like sprinting throughout a marathon, which is unsustainable.

KEY QUOTES

"We need clear, concrete steps to take, rather than distant, abstract goals. Otherwise we might do nothing at all."

"Tracking your progress provides you with tangible evidence that you're moving towards your goals."

"People boost our feel-good emotions and make us want to get started. Life is better with friends around."

"You can focus on the small losses. Or you can celebrate the small wins."

"Procrastination isn't something we can always control. Forgiving ourselves is something we can."

"Burnout isn't just a thing that happens to overworked people in stressful jobs. It can happen to anyone when work stops feeling meaningful, enjoyable or manageable."

- Similar to how a car needs fuel and maintenance, we need energy and focus to function effectively over time. *Conserve your energy* by (i) avoiding overcommitment, (ii) limiting distractions, and (iii) taking regular breaks.

Don't overcommit. Protect your mental and physical resources by setting boundaries around work and rest.

- *Create an energy budget*: Allocate energy to high-priority tasks, like how you'd allocate financial resources to investments. Get clear on your key goals and filter out unnecessary commitments.
  - Create 2 lists: (i) long-term goals and dreams, and (ii) active projects you're working on right now.
  - Decide on the total time to invest in active projects each week (ideally limit to <10 hours), then allocate the time to maximize returns.
- *Learn to say "No"* to requests that don't align with your priorities.
  (i) Use Derek Sivers' advice: Only say "yes" to things that you feel enthusiastic about ("hell yeah!"). Say "no" to everything else.
  (ii) Consider the opportunity costs: saying "yes" to one thing means saying "no" to something else.
  (iii) If a request happens only in a few weeks' time, ask yourself: "Would I be excited if this was happening tomorrow?" This stops you from accepting commitments just because your calendar is currently clear.

Limit distractions so they won't drain your energy and focus. Multitasking involves "switching costs", since we need mental energy to toggle between tasks. For optimum productivity, focus on one task at a time, but switch tasks periodically to avoid mental exhaustion.

- *Add friction*: Make distractions less accessible or enticing, such as keeping distracting apps in a sub-folder on your phone, or even locking your phone in a drawer. You're less likely to engage in a distraction if you must make a deliberate effort to reach it.

KEY QUOTES

"If you can make yourself feel better, you won't just achieve more–you'll last longer, too."

"Overcommitting is simply too easy. But that doesn't mean it can't be resisted."

"We tend to think we can do everything. It's a myth. Sustainable productivity means recognising the limitations on our time. Everybody has them."

"If it isn't a 'hell yeah', it's not worth doing. If it isn't a 'hell yeah', it's not worth doing."

"Do less, so that you can unlock more."

"I'm actually as proud of the things we haven't done as the things I have done."
—Steve Jobs

"The goal is to spend most of our time focused on just one task–but not beat ourselves up if we occasionally lose concentration."

"Give yourself permission to be distracted."

- *Do course correction*: If you get distracted, don't beat yourself up or think "Since I already got distracted, I might as well continue." Accept that it's normal to get distracted occasionally, and just return to your main task.

Take regular breaks throughout the day to recharge and maintain your energy/focus. Research found that the most productive workers took a 17-minute break after 52 minutes of job-related tasks.

- *Schedule short breaks* throughout the day (e.g. 5-10 minutes every hour) to stretch, take a walk, or just do nothing. You can also use techniques like the Pomodoro method to alternate between focused work and regular breaks.

- Not all distractions are bad. *Embrace positive distractions* that refresh and energize you, such as music or an uplifting conversation.

Recharge

To maintain optimal productivity and avoid depletion burnouts, we must replenish our mind, body and spirit through rest, relaxation, and revitalizing activities.

- You can *recharge through creative activities, Nature, or idle relaxation*.

Recharge creatively: Engage in CALM, restorative activities that meet 4 criteria: they (i) boost your competence, (ii) give you a sense of autonomy, (iii) offer liberty or freedom from work, and (iv) provide a mellow, relaxing experience.

- *Engage in calm hobbies* like painting or playing a musical instrument. These are creative, soothing activities that provide enjoyment without requiring productivity. You can improve your skills over time, but the main goal is to enjoy the activity. Don't try to perfect the hobby or make it into work.

- *Start calm projects* like DIY projects or working on a puzzle. These are creative projects with a clear end-goal. They require gentle focus and offers a sense of accomplishment, but without massive effort or pressure. You can involve other people to make the activities even more rejuvenating.

KEY QUOTES

"As long as we correct course, we'll still end up at our intended destination."

"Find moments in your working day to do nothing. And embrace them."

"Breaks aren't a special treat. They're an absolute necessity."

"Life isn't about maintaining focus all the time. It's about allowing space for little moments of serendipity and joy."

"Your mood is suffering because you haven't given yourself the deeper periods of time off that you need – not just little breaks throughout the day, but the longer breaks that recharge the energy of your mind, body, and spirit."

"Your primary goal is not to become an expert or a master. It's to enjoy and to recharge."

"If you want to properly recharge, you need to maintain areas of your life in which personal advancement doesn't feature at all."

Recharge naturally: Tap into Nature's restorative effects to rejuvenate yourself, reduce stress, and feel better.

- *Incorporate nature into your surroundings*, e.g. adding plants or nature-inspired artwork to your work area, or opening the windows to let in fresh air. Such natural elements help to improve focus and reduce stress. For instance, patients in a hospital room with tranquil paintings were found to be less anxious and needed less pain medication, compared to those exposed to dark photography, abstract art, or no images at all.

- *Go for a walk*. Enjoy the gentle physical activity and fresh air, be it a walk through a park or around your office. Ideally, take long walks without a time limit, but even a 10-minute walk could provide a useful mental break.

Recharge mindlessly: Let the mind drift without directed focus, and relax without trying too hard. Neuroscience research shows that when we "do nothing", it triggers the brain's default mode network—it starts to revisit past memories, daydreams, or imagines the future, often leading to creative solutions.

- *Let your mind wander freely*: Engage in activities that allow the mind to flow freely without specific goals or tasks. Examples include: doodling, staring out of the window, or doing routine chores without listening or watching anything concurrently.

- *Embrace the Reitoff Principle*: Give yourself permission to just to rest and do nothing at all. Forget about productivity, mindfulness, or engaging in restorative activities. Just write off the entire day or week to rest fully. If you feel guilty taking the break, then remind yourself you'll be more productive when you return from the break feeling fully rested.

Align

Misalignment burnout occurs when we invest time and effort in pursuits that don't match our sense of self, resulting in exhaustion without fulfillment.

- Motivation falls on a spectrum, ranging from external motivation (doing things due to external pressures) to intrinsic motivation (doing things aligned with our interests and

KEY QUOTES

"Nature replenishes our cognitive abilities and boosts our energy."

"If you're looking for a simple and easy way to immediately feel rejuvenated, just try taking a walk–no time limit, nodistance to reach, no place in particular to go."

"Doing nothing can be surprisingly productive."

"When the brain relaxes sufficiently, creative solutions do appear."

"Sometimes it's worth doing nothing at all. Not having deep shower thoughts. Not having a gentle walk. Nada."

"By doing less today, you can do more of what matters to you tomorrow."

"Overcoming misalignment is a lifelong task; one that requires us to continually work out what really matters to us, and change our behaviour accordingly."

values). The greater the intrinsic motivation, the more fulfilling and sustainable the activity.

- To sustain productivity, *align your goals and actions with your core values and purpose*—over the short-term, medium-term, and long-term.

Long-term alignment: Why do people redefine their priorities after life-threatening experiences like a serious accident or illness? Often, they shift their focus away from extrinsic goals (e.g. earning more money) to intrinsic goals (e.g. nurturing close relationships). You don't need a crisis to start focusing on what truly matters to you.

- *Write your eulogy*: At the end of your life, what would you want your eulogy to be like? What legacy, values, and achievements would you want to leave behind? Use this as a guide to shape your daily actions.

- *Map out 3 different life paths* for the next 5-10 years, to consider if you're truly on your desired path.

  (i) *Current path*: What would life be like in 5-10 years if you continued as you are now?

  (ii) *Alternative path*: What would life look like in 5-10 years if you took a totally different direction?

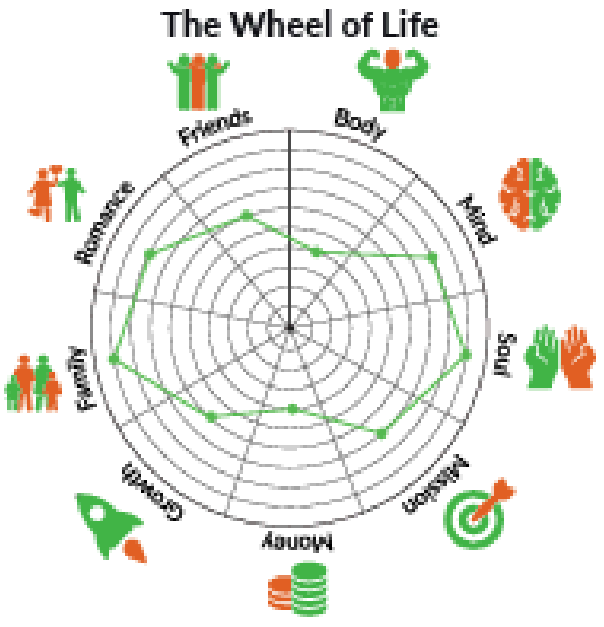
  (iii) *Radical path*: What would life look like in 5-10 years if you ignored financial and social expectations?

Medium-term alignment: Align your daily actions with your goals over the next 1 year.

- Use the *Wheel of Life chart* to assess various aspects of your life.

  (i) On a scale of 1-10, rate how aligned your actions are with your goals for each area of life, e.g. work, health, relationships.

  (ii) Create a plan to align the areas that are out of balance.



KEY QUOTES

"We can sustain our feel-good productivity by aligning our present-day actions with a deeper sense of self."

"When we think about death, we get a clearer view of life."

"What does the life you want people to remember in a few decades mean for the life you should build now?"

"By sketching out the paths ahead, you can work out which one you really want to take."

"Values affirmations make our most abstract ideals real. And they boost our confidence along the way. The only question is how to find these values–and how to use them."

- *Year-end celebration*: Imagine celebrating your progress at the end of 12 months.

  (i) For each area in your life, what progress or moments would you be the proudest of?

  (ii) What must you do now to make this celebration a reality?

Short-term alignment: Set up practices to align your day-to-day decisions and actions with your values.

- *Daily alignment quests*: Choose 3 areas of focus from the Wheel of Life, e.g. relationships, health, and work. Commit to 3 specific actions daily to support your core values. For example:
  - 10am: Send LinkedIn invites to potential mentors (W)
  - 3pm: Call Mom to reconnect (R)
  - 7pm: Swim for 30 minutes (H)
- *Alignment experiments*: Treat alignment as an ongoing journey. Keep testing ways to align your actions with your values.

  (i) Identify an area of dissatisfaction, e.g. personal relationships.

  (ii) Develop a hypothesis: What could you change to improve the situation (e.g. replacing social media time with a walk or chat with a loved one)?

  (iii) Make the change, assess the impact, and keep fine-tuning.

Other Details in the Book to Look out For

Feel-Good Productivity is not about doing more; it's about doing what matters in a way that's fulfilling and energizing. The key is to experiment with the strategies and practices above to find out what works best for you. The book includes many other personal anecdotes and empirical research references. For more details, please visit www.feelgoodproductivity.com.

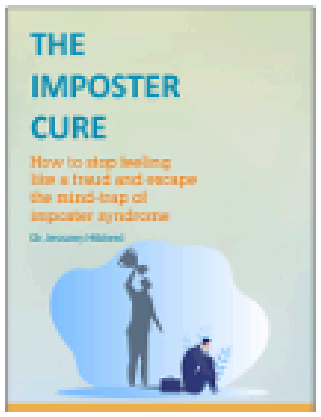
KEY QUOTES

"With the right tools, we can subtly shift ourselves back towards the things that matter the most."

"The journey to alignment is not one with a clear end-goal. It's a never-ending process."

"As we navigate the laboratory of our lives, we must be willing to embrace experimentation–and to learn as we go."

"Don't rote-learn your way to feel-good productivity. Experiment your way."



THE IMPOSTER CURE

How To Stop Feeling Like A Fraud And Escape
The Mind-trap Of The Imposter Syndrome

DR. JESSAMY HIBBERD

Introduction

The imposter syndrome occurs when people believe that they're not worthy of success and lack the skills, competence or intelligence expected of them. As a result, they feel undeserving of their achievements and are constantly afraid of being exposed as a fraud.

In this book, clinical psychologist Dr Jessamy Hibberd provides a step-by-step guide to help you understand and overcome the imposter syndrome, rebuild your confidence, health and well-being.

- There are *3 main steps* involved:

  (i) Consciously choose to change;

  (ii) Understand the theory behind the imposter syndrome; and

  (iii) Test out all the strategies to find out which ones work for you.

- In this summary, we've consolidated the insights into *2 parts*.

Part 1: Understanding the Imposter Syndrome

What's Imposter Syndrome?

Imposter syndrome comes from the underlying fear that you're not good enough. It can affect anyone from students to professors, executives and entrepreneurs.

- About 70% of people have experienced the imposter syndrome at some point, though it *affects different people in*

KEY QUOTES

"You are enough, right now, exactly as you are."

"You need to want to change, to really listen to the new evidence and you have to test it out."

"The more you know about imposter syndrome the better your chance of beating it."

different degrees. Some occasionally feel worried about their inadequacies, while others are constantly plagued by self-doubt, fear of failure, or fear of being "found out".

- It usually begins with a task or challenge where the *perceived expectations exceed your perceived abilities*. Someone with confidence may simply take action to bridge the perceived gap. However, someone who lacks self-belief may start to dwell on their inadequacies and how they might fail. They end up acting in ways that lead to their own failure, which further reinforces their poor self-esteem.

- This is worsened *in times of change or difficulty*, e.g. when you have a new job, bigger responsibilities, or feel out of place (e.g. a female in a male-dominated sector).

Not everyone defines competence the same way. According to Dr Valerie Young, there are 5 types of imposters. They differ in the yardsticks they use to measure competence.

The 5 Imposter Types

- *The Perfectionists* set impossibly-high standards and seek to achieve them 100% of the time. They beat themselves up even if they're just 1% off the mark. They also dictate how exactly they should achieve the goal and feel dissatisfied if things don't go exactly according to plan.

- *The Experts* are the knowledge version of the Perfectionist. They expect themselves to know everything, and feel like a failure if there's just a tiny gap in knowledge.

- *The Natural Geniuses* also set impossibly high standards, but they measure competence based on whether they reach the target on their first attempt. They believe that someone who's naturally talented should be able to do things quickly and effortlessly. They equate struggles with incompetence, and don't cope well with setbacks.

- *The Soloists* define competence as the ability to do things on their own without assistance. They take pride in the

KEY QUOTES

"Imposter syndrome normally occurs when there is a tension between two views—yours and what you believe others expect of you."

"When perfection is the aim, everything is always going to fall short, and success is seldom satisfying."

ability to do things independently, and see any form of help (e.g. coaching, advice, assistance) to mean they've failed.

- *The Superhumans* evaluate competence by the number of roles they can juggle and excel in. They expect themselves to perform perfectly in multiple roles (e.g. parent, friend, manager) and tend to overextend themselves.

Which of the 5 imposter types are you likely to be? How does it affect the way you do things, and what negative impact could it have on your life?

The Imposter Mind-Trap

The imposter syndrome involves a set of beliefs, feelings & behaviors that reinforce one another in a vicious cycle.

- Imposters believe that they are *not good enough*, and see their discomfort and anxiety as evidence of their incompetence.
- To prevent others from discovering that they're frauds, they resort to *overwork or avoidance*. Unfortunately, such coping strategies only lead to worse performance and/or burnout.

  (i) *Overwork*: Hard work is good, but not if you overdo it to expend more energy than needed and sacrifice other priorities, e.g. health and relationships.

  (ii) *Avoidance*: You won't realize what you can do if you don't speak up, put yourself forward, take risks, or seek help. Or, you may procrastinate until it's too late to do a good job.

- Even when they succeed, imposters ignore positive feedback or praises, *dismiss their achievements and magnify their mistakes*, thus reinforcing their negative self-beliefs.

KEY QUOTES

"If you are a Soloist…asking for help is a sign of weakness and you fear it might reveal your incompetence."

The Beliefs Behind Imposter Syndrome

Much of our beliefs are formed during childhood, through a mix of *nature* (personality) and *nurture* (family environment and upbringing).

- Your *personality* includes your level of extraversion, openness, conscientiousness, agreeableness, and neuroticism. It affects how you interact with the world around you. For example, some babies are more prone to anxiety and cry often. So, their parents may avoid exposing them to new places/ people, and strangers tend to stay away from them. Other babies are naturally calmer, so their parents may bring them to new places, and strangers are more likely to approach them. The babies' personalities affect their experiences, which then influence their views of the world.

- The *people close to us* (e.g. parents, teachers, friends, siblings) also shape our self-concept and how we think we should behave.

  (i) Children who receive mixed messages about success or are regularly shamed/rejected by their parents are more likely to develop low self-esteem and become more susceptible to the imposter syndrome.

  (ii) Family members often compare children or use labels like "the trouble-maker" or "the smart one". Both positive and negative labels can be damaging, since children may conclude that they're stupid, or feel pressured to win all the time because they're smart.

  (iii) Your definition of success and failure is also influenced by how your parents respond to their *own* successes/failures as well as how they respond to *your* successes/failures.

Our beliefs and views evolve as we mature, but our childhood imprints remain. Reflect on where your beliefs may have come from:

- What *messages* did you receive about your ability, intelligence, or importance? Which role models and events impacted you the most (and how)? How did those closest to you respond to your successes and challenges?

KEY QUOTES

"Children tune in to the subtle and not-so-subtle messages they are given, which influence how they think about themselves and the world around them."

"Looking back at your history is not about blaming anyone, it's about understanding yourself better."

- Are those beliefs still *valid* (correct and updated)?

Our beliefs help us to filter, classify and assimilate information, thus providing a framework to make sense of the world. However, this also leads to a confirmation bias:

- Beliefs/biases are *hard to change* because we seek out information that support our beliefs and ignore those that don't.

  (i) We pay more attention to ideas that fit with our beliefs; and

  (ii) We may distort new information to fit what we "know."

- We also tend to *feel strongly about our beliefs*. The stronger the emotions associated with a belief, the harder it is to change it.

The imposter syndrome tends to be self-fulfilling:

- If you believe you're an imposter, you'll focus on your shortfalls/inadequacies and dismiss your achievements. Your fear and anxiety impair clear thinking and increase the chances of errors, which further reinforce your sense of inadequacy in a *vicious cycle*. In the long run, it could even lead to depression and anxiety disorders.

- *For example*, a successful businessman felt like such a fraud that he was constantly worried he'd fail his loved ones and get "found out". He even feared that someone may show up at his home to tell him the house wasn't his! He became so anxious that he started to flounder at work, drink excessively, and distance himself from those who cared about him.

Part 2: Freeing Yourself From the Imposter Syndrome

The key to change is to realize that you're not an imposter. You're merely *worried* that you're an imposter, which leads to ineffective copings strategies that sabotage your results and well-being.

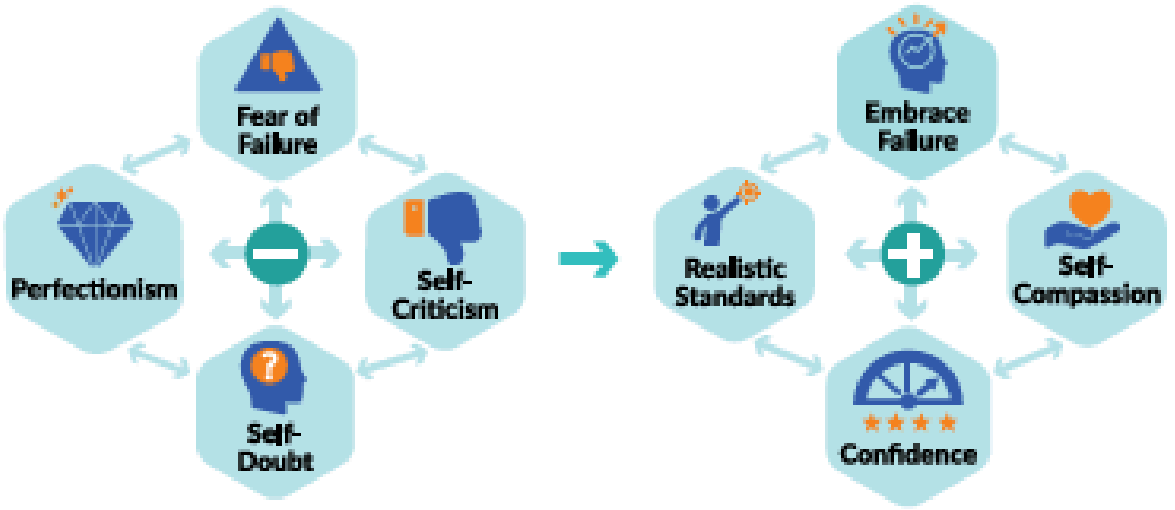
- In this section, we'll address each of the *underlying elements*—including secrecy, fear of failure, self-criticism, self-doubt,

KEY QUOTES

"Fear can drive us to do things without really thinking them through."

"Just because you worry you are an imposter, it doesn't mean you are one. Your feelings are not facts."

perfectionism, discounting positives and magnifying negatives—and explain how you can break the vicious cycle, adopt helpful strategies and build your confidence.



Replacing Old Beliefs

Before you can change your beliefs, you must want to change. Realize that you can strive for excellence and be humble *without* constantly putting yourself down.

Your beliefs are like a well-trodden path. Each supporting thought or action reinforces it until you automatically head down the path whenever you experience a trigger. To change a belief, you must build a new path gradually until it becomes the new default.

- Look for evidence to gradually chip away at old, unhelpful beliefs and *see yourself in new light*. Practice the strategies below to accelerate the process, like using a lawnmower to clear the new path. The process will get progressively easier with practice.

Externalize the imposter voice, or the voice in your head saying "You're a fraud" or "Wait till they notice your screw-ups". Imagine the voice to be that of a bully or someone you won't take seriously.

Realize that thoughts and feelings are not facts.

- Emotions help us to understand our inner world and give meaning to life, e.g. love helps us to feel close to others, and fear alerts us to potential danger. However, being afraid doesn't mean you're in real danger, and feeling insecure doesn't mean you're inadequate. So, *don't judge your abilities using emotions alone*.

KEY QUOTES

"Overwork, avoidance, self-criticism and self-doubt are a toxic combination, leading to feelings of shame and inadequacy."

"Changing your belief about yourself means finding a new path."

"You need to listen to your feelings, but do not treat them as more important than all other information."

- Question if there's *real evidence* to support (or even contradict) the negative voice. How would you react if you heard your friend saying the same things?

Speak with others to realize you're not alone. Many others also feel insecure even if they *appear* confident. Share your experiences and mistakes to help one another to move forward.

There will always be things in life beyond your control. Instead of trying to control everything, learn to embrace uncertainty and see life as an adventure. When you veer off-course, treat it as a chance for exploration. Learn to find solutions to unexpected problems, so you can overcome any challenge and even create better outcomes from setbacks.

Shift from Fear of Failure → Embracing Failure

Imposters tend to be fearful and unforgiving of their failures. They amplify mistakes and see them as a confirmation that they're frauds. This leads to self-doubt and ineffective coping strategies which paradoxically increase their chances of failure.

In reality, everyone makes mistakes and no one knows everything. Accept failures and mistakes as a part of life, growth and success. Instead of avoiding mistakes, use them to learn and build resilience.

- See yourself as a work-in-progress. *Give yourself the permission to fail*, but learn from every mistake to become better and stronger.

- Don't amplify your anxiety by *generalizing, magnifying or personalizing mistakes*. Specifically:

  (i) Don't assume you failed because you're stupid or inadequate. Think "I didn't succeed this time", not "I'll never get it right".

  (ii) Don't project your own fears to assume that's what others think about you.

  (iii) Realize that 1 mistake doesn't mean the end of the world.

  (iv) Don't focus on the 5% that went wrong and ignore the 95% that went well.

KEY QUOTES

"No matter how hard you try, there's no route through life that is pain-free."

"It's a paradox—our successes are achieved through trying, yet trying often ends in failure."

"Overcoming imposter syndrome doesn't mean you'll stop making mistakes; it means accepting that they're part of life and that you need to learn how to use them to your advantage."

"The path to success is not linear and without failure we can't progress."

(v) Don't blame yourself for every bad thing that happens, or for not having foreseen how things would go.

- After every major task or project, *reflect* on what happened, what you felt, did and learned.
- *Criticism ≠ failure*. Don't treat negative feedback as a sign of personal failure; keep the useful feedback and drop the rest.
- There're always *multiple solutions* to a problem. Don't get fixated on 1 "right" choice or approach.

Shift from Self-Criticism → Self-Compassion

You do *not* need self-criticism to prevent complacency. Chronic self-criticism demoralizes and demotivates you to worsen your results. It's like having a coach who constantly yells at you, reminds you of your failures and tells you that you're useless.

The antidote to self-criticism is self-compassion, i.e. treating yourself kindly and non-judgmentally. It's like having a coach who highlights your strengths, celebrates how you've improved, and points out how you can do even better.

- Self-compassion makes it easier to accept yourself, bounce back from setbacks, and take constructive action. According to Kristin Neff, there are *3 parts to self-compassion*:

  (i) Recognize that you're struggling or stressed without judging or overreacting;

  (ii) Be understanding and supportive to yourself when you're having a hard time; and

  (iii) Remember that everyone struggles and makes mistakes.

- To *become more compassionate to yourself*:

  (i) Notice your self-criticisms and dial them down, or externalize the voice so you can challenge the statements.

  (ii) Use an empathetic voice. Think of someone compassionate and imagine how they speak. Then, use that voice to tell the critical voice, "That was hard, but I did my best and I'll improve with practice."

KEY QUOTES

"Self-criticism preys on what's most important to you and makes everything seem worse than it is."

"Think of compassion as the mortar that holds everything together, so you can confidently rebuild the bricks of who you are and how you operate."

"Compassion [is] an essential ingredient for life. Compassion will teach you to support and motivate yourself with kindness rather than criticism."

(iii) Be kind to yourself, e.g. have a cup of your favorite tea or listen to some calming music.

Shift from Perfectionism → Realistic Standards

Imposters constantly feel like they don't know enough or aren't good/smart enough. By aiming for perfection and unachievable goals, they set themselves up to fail.

- Perfectionists think they'll only be happy when they reach perfection. They feel dissatisfied no matter how good their results are, and feel ashamed each time they miss the mark or allow themselves to relax. They keep pushing harder until they *burn out or collapse*, or use the pursuit of perfectionism to hide their insecurities.

- Research shows that perfectionists are more likely to suffer from anxiety, depression, chronic fatigue, insomnia, and a range of *stress-related disorders*.

Go for healthy conscientiousness, not unhealthy perfectionism. You can still strive for excellence without (i) using it to define your self-worth, (ii) sacrificing all other priorities, or (iii) beating yourself up for not being perfect.

- Letting go of perfectionism doesn't mean becoming sloppy. It's about setting *realistic standards* that you can achieve while addressing other priorities (e.g. health and happiness).

- Excel in a *few important things* rather than try to be 100% in everything all the time.

- We must all *learn continually* throughout our lives, especially in new roles or situations.

  (i) Give yourself 3-6 months to settle fully into a *new role*. If there's something you don't know, it's ok to say "I don't know, let me check and get back to you." Learn to do research, seek help or advice, ask questions and attend training/courses.

  (ii) Even if you're *skilled or experienced* in a role, you're still not expected to know everything. It's more critical to know how to find new ideas/solutions by applying your

KEY QUOTES

"Aiming for perfection shows an imperfect mindset."

"Perfectionism is not just unrealistic, it' also costly."

"Not aiming for perfection doesn't mean you don't care, or that you're not bothered about success."

knowledge, getting more information or leveraging on your network.

(iii) If you're *struggling with your work*, have the courage to ask for help: seek clarity or information about the tasks, ask your boss to help you prioritize your work, or request for more time, resources or training.

Shift from Self-Doubt → Confidence

It's normal to feel insecure at times. However, imposters equate insecurity with inadequacy. Their extreme self-doubt leads them to question and overanalyze everything.

- Confidence and insecurity are actually linked. You can't be truly confident about something until you've *confronted your doubts and fears*. Instead of hiding your self-doubt, use it as a driving force for improvement.

- When you're *confident of yourself*, it's easier to try new things, reach for bigger goals, manage stress and overcome challenges.

- *Internalize your achievements and strengths*:

  (i) List down *every* achievement you've made in your life, without questioning how/why you achieved it. Include your qualifications, promotions, pay raises, praises from others, leadership roles, challenges you've overcome, and any other successes in your personal life (e.g. hobbies, family). Realize that you can't have achieved all these based on luck alone.

  (ii) Pay attention to your unique combination of strengths, skills and qualities. Think of the words that others use to describe you positively (e.g. honest, reliable, friendly). Ask ≥3 friends/family members to share your list of good qualities. Consolidate these lists to identify your *top 5 strengths/skills*.

  (iii) Try *matching* your strengths, capabilities and experience with the tasks at hand. Your intuition will improve with time.

- *Embrace all of yourself*, not just the "good" parts. Each time you feel upset, reflect on what's happening and release the

KEY QUOTES

"Doing well means knowing how to get the job done, but it also means knowing your own limits."

"Sometimes our imperfections are the elements that give us our strengths."

"Being comfortable with yourself and confident in your abilities is the ultimate protection against imposter syndrome."

emotional burdens. When things go well, consider what/how it happened.

- Take 5-10 minutes daily to *reflect on the good things*, i.e. things that went well or made you feel good. Don't be afraid to talk about what you're proud of or what's going well for you. Celebrate every accomplishment.

- *Step out of your comfort zone* and do something you've been avoiding, e.g. try new things, visit new places, or tackle a challenge you've been putting off. Each time you do so, you're expanding your boundaries to explore and discover your true potential.

Managing your Moods and Feelings

Learn to manage fear and anxiety, which are at the heart of the imposter syndrome:

- *Let the feelings pass naturally* instead of fighting them.

- Recall how you overcame a *similar concern in the past* and remind yourself that you can handle it. Indeed, a study found that 85% of participants' worries never happened. Of the remaining 15% that occurred, 79% of the participants were able to handle them better than expected or learned something worthwhile.

- Use *relaxation techniques* (e.g. yoga, deep breathing) to calm yourself.

- Think of *uncertainty* as simply something you've yet to learn.

- When you're preparing for something important, use *visualization* to imagine yourself completing the task perfectly. Visualize the process so vividly that you can see, hear and feel every step in detail. Repeat the mental rehearsals to make it easier for your mind and body to recreate what you've visualized.

Manage low moods that may fuel your fears and self-doubts.

- Other people are too focused on their own lives to scrutinize everything you say or do. *Stop worrying about what others*

KEY QUOTES

"Self-awareness allows you to be aware of insecurity, rather than being insecure."

"Feelings are a bit like clouds; they're not permanent but around for a while before moving on."

"Uncertainty isn't something bad, just something you don't know the answer to yet."

think or trying to please them. Instead, start to speak up and share what you truly think.

- *Avoid the comparison trap*. We tend to compare the best of we see in others with the worst of what we see in ourselves. Remember: what you see on social media is also not truly representative of others' lives. Only connect with people who inspire and uplift you.

- *Make time for other priorities*. Periodically disconnect from your digital devices. Practice mindfulness by applying all 5 senses to your situation—what do you see, hear, touch, smell and taste? Once you notice yourself being dragged down by your worries, break the cycle by switching your focus to something else, then revisit the issue with a more constructive frame of mind.

Stop dismissing your achievements. Acknowledge the role of external factors (e.g. luck, team effort, contacts) without discounting the role of internal factors (e.g. skills, focus, perseverance, passion) or your own contributions.

- "*I was just lucky*." Luck plays a role in every success, but you must also put yourself in a position to attract opportunities and take the right actions to bring them to fruition.

- "*It was just fluke*." You must have had several successes in life, and they can't all be flukes or one-time/accidental occurrences.

- "*I just worked hard*." Hard work is a key ingredient for success, but it must be accompanied by curiosity, a willingness to learn, and the ability to bounce back from set backs. In any case, hard work isn't easy since it requires persistence/focus, so give yourself some credit for your effort.

- "*I was in the right place at the right time*." Timing is important for success, but you also need the skills to recognize the right timing and seize the advantage.

- "*People just liked me*". You may have a promotion, a bigger role, or an award because you're likeable, but you must also have demonstrated the necessary skills and competencies for the role. In short, likeability is a valuable skill not to be dismissed.

KEY QUOTES

"It's what you turn luck into that differentiates who is successful and who is not."

"Hard work is the core component of success, not a reason to discount it!"

- "*It was a team effort*." It's good to give credit where it's due, but don't dismiss your own contributions, nor your ability to lead, integrate or work with a team.

- "*I knew the right people*." Leveraging your network/contacts to get something done doesn't make it less valuable. After all, you need skills and effort to develop a strong network and earn the trust/goodwill of your contacts before they'll help or support you.

Beat Overwork and Avoidance to Reclaim Your Life

Reassess how you allocate your time and energy. List down *everything* you do in a typical day, including meals, commuting, meetings, replying to emails, and tasks in your personal life. Next to each item, estimate how much time you need. Ask yourself if you can truly fit it all in. If not, what your priorities and boundaries? Focus on just couple of items that are truly important to you, then delegate or let go of the rest.

Stop overwork and avoidance.

- Recognize the signs of *overwork*: regularly working late nights and weekends, repeatedly going over details, or pushing back deadlines because the work isn't "good enough".

  (i) Realize that hard work is a requirement for succeed, not a sign of your incompetence.

  (ii) Fast-forward to the end of your life and imagine what your biggest regrets might be. Start making time for them *now*.

  (iii) Finish each task at 80% (instead of 100% perfection) and see if anyone notices the difference. Think of it as improving your efficiency, not reducing your quality.

- Be aware of your *avoidant strategies* and why you're using them.

  (i) If you confront a challenge, you at least have a chance of success; if you avoid it, you'd definitely fail. See feedback as a chance to learn and improve, not something to avoid.

KEY QUOTES

"Success is not the result of one lucky strike. Lots of effort means there's space for good timing and everything to fall into place."

"Your capacity is not infinite, so choose wisely."

"It is possible to have time to enjoy your life and still be ambitious."

(ii) If a task/challenge seems too overwhelming, just focus on the first step and how it will help you move toward your goal. Work for 45 minutes, then give yourself a tiny reward or switch to a minor task (e.g. checking emails for 15min).

Start living each day fully. Goals give you a direction in life, yet life is paradoxically not about chasing goals.

- Instead of doggedly pursuing your goal, slow down slightly to appreciate what you already have. People who *practice gratitude* tend to be happier, healthier and more fulfilled.
- Schedule time to *rejuvenate yourself*. Set aside (i) "empty time" to daydream, rest and recover, and (ii) time for things that you enjoy and energize you (e.g. singing your favorite songs, or taking a nature walk).
- Reflect on these questions: *What does success mean to me?* What do I want from my life? What is it all for? Write down your answers and figure out your personal recipe for success.

Other Details in the Book to Look out For

This book is structured like a self-help guide where Dr. Hibberd walks you through the process of re-evaluating your beliefs and exploring a new way to work and live. She includes numerous real-world examples to explain the imposter syndrome and bring the concepts/strategies to life. For more details please visit drjessamy.com.

About the Author

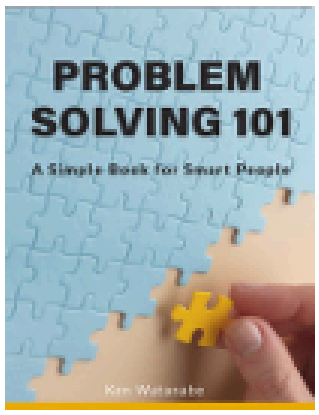
Dr. Jessamy Hibberd is a London-based chartered clinical psychologist, author and speaker. She has over 15 years in clinical practice and runs an online clinic offering 1- to-1 therapy. She contributes regularly to various media and publications, and has authored and co-authored several bestselling books. She received her Doctorate in Clinical Psychology at Royal Holloway, University of London, and completed her accreditation in CBT at Kings College's Institute of Psychology.

KEY QUOTES

"Think of life as an adventure, something to experience rather than a mountain to conquer."

"When you become obsessed by that final goal...it can blind you to the adventure of life and its real purpose: living."

"Together we've planted the seeds of change; it's now up to you to look after them, to water and nurture them, so they continue to flower year after year."



PROBLEM SOLVING 101

A Simple Book for Smart People

Ken Watanabe

The Big "So What"

Everyone faces problems, be it students, working professionals, or a country's prime minister. In this book, Watanabe presents a simple but powerful approach that can be used by anyone to solve any problem, big or small.

Introduction

Prior to writing this book, Watanabe worked as a consultant with McKinsey & Company, helping companies worldwide to solve complex problems. This book captures the problem-solving tools and approach that he used.

- He originally wrote *Problem Solving 101* **as a guide to critical-thinking** for Japanese schoolchildren. The book was so **effective that it quickly became an international bestseller for** readers of all ages.

This method and approach in this book can guide and expand your thinking, to help you **find solutions to any problem, dream** or goal—be it to learn a new skill, develop your dream career, or solve a global crisis.

- **In this summary, we'll be presenting the key ideas in** *2 parts*:

  (i) **Mindset and approach for effective problem-solving; and**

  (ii) The 4 steps and toolkit for solving any problems. We'll also explore 2 detailed examples to illustrate how to apply the problem-solving tools and techniques.

KEY QUOTES

"There's a fundamental approach to solving these real-life problems, one that can consistently lead you to ***effective and satisfying solutions."***

"Being a problem solver isn't just an ability; it's a whole mind-set, one that drives people to bring out the best in themselves and to shape ***the world in a positive way."***

Part 1: Becoming a Problem-Solving Kid

The Problem-Solving Mindset

Problem-solving isn't an inborn talent; it's a set of skills, attitudes, and processes that can be learned.

Watanabe uses 5 types of problem-solvers to illustrate the ingredients behind great problem-solving:

- *Defeatists* give up easily and feel victimized by circumstances. They choose to avoid problems, and give up when confronted by the slightest difficulties. They say things like "I can never do that," and blame others for not understanding or supporting them.

- *Critics* are always shooting down others' plans, without lifting a finger to solve the problem themselves. They stay on the sidelines, complaining, criticizing, and saying things like "That's a stupid idea" or "I told you so."

- *Daydreamers* are always dreaming up new ideas. But, they keep their heads in the clouds, refusing to explore tangible plans or take concrete action. They can be heard saying things like: "If only this could happen" or "Don't bother me with details!"

- *Dynamos* jump into action without planning ahead. They're enthusiastic, optimistic, and perseverant. But, they don't stop to think things through, or to understand a problem before charging ahead. As a result, they waste time and energy doing things that are often ineffective. When they fail to get results, they simply push harder, saying things like, "I can't stop now...I must keep going!"

- "*Problem-solving kids*" combine thinking and acting to solve problems effectively.

  (i) They examine a problem to identify its root cause, develop a plan, take action, learn from both success and failures, and keep adjusting their plans as new challenges appear.

KEY QUOTES

"Problem solving isn't a talent that some people have and others don't. It's a habit. By developing the right skills and adopting the right attitude, anyone can become a problem-solving kid."

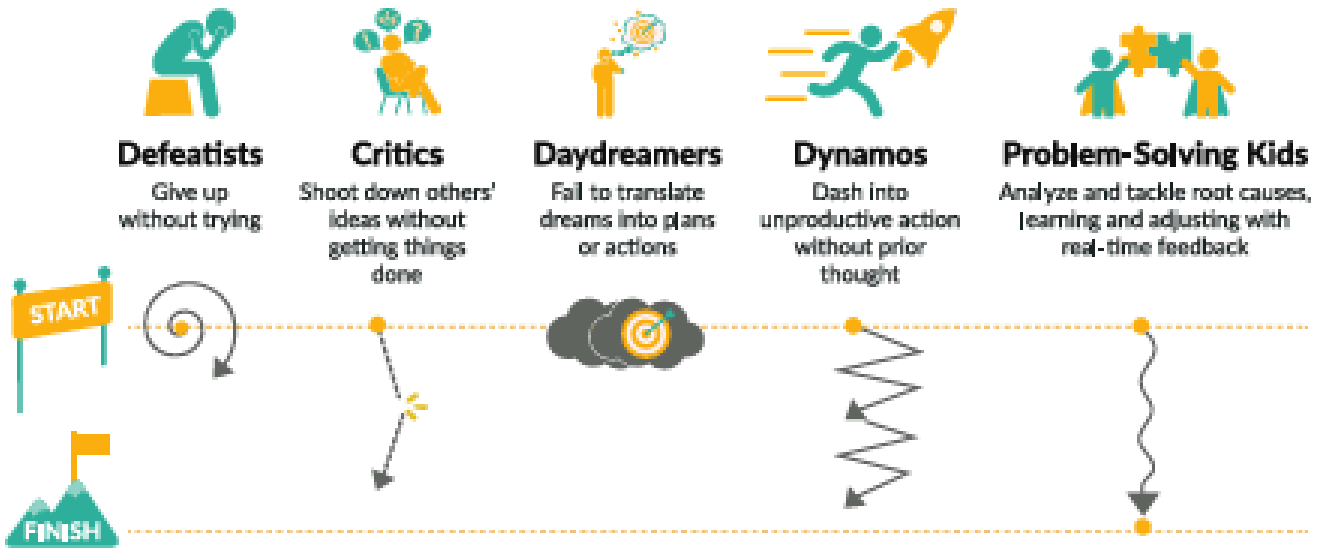
"Being a critic is easy; getting stuff done is the real challenge."

"Stopping to think can be just as important as taking action."

"Problem-solving kids have a real flair for setting goals and getting things accomplished. They take overcoming challenges in stride."

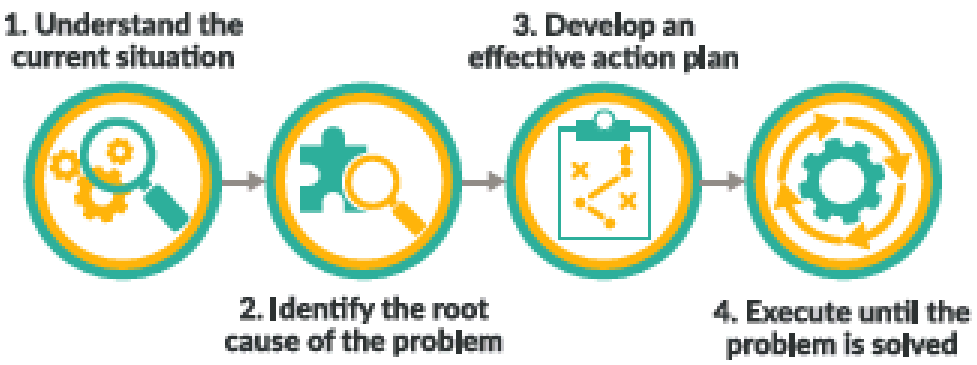
(ii) They break down ambitious goals and dreams into smaller, bite-sized milestones. They say things like, "What's the root cause of this problem?" or "Let's fix X, Y, and Z in 3 months."

(iii) As a result, they achieve their goals more quickly, and also learn and evolve much faster than the other 4 types of problem-solvers.



The 4 Steps of Problem-Solving

When you see a doctor, they'd analyze your symptoms (e.g. fever, aches) to diagnose the root cause (e.g. flu), to prescribe the cure (flu medicine). Likewise, to solve any problem, you must first diagnose the root cause. Problem solving can be broken down into 4 steps:



- Understand the *current situation* or issue.
- Identify the *root cause* of the problem.
- Develop an effective *action plan*.
- *Execute* until the problem is solved, making adjustments as needed along the way.

KEY QUOTES

"Understand the situation, identify the root cause, develop an effective plan, and execute."

You need all 4 steps to solve a problem effectively. Once you've learned how to break a problem down into small, manageable chunks that you can solve, you can stay calm in face of any challenge—no matter how big or scary.

Simple example: Let's imagine that you're trying to improve your physical fitness, but not getting the results you want. An average person might just assume that he/she must train harder. However, if you were a problem-solving kid, you'd approach it differently.

- *Identify the problem*: "I'm not seeing the improvement in physical fitness I want."
- *Break down the problem* into sub-parts. In this case, you might realize that you're falling short in 3 specific areas: cardiovascular endurance, muscle strength, and flexibility.
- From there, you'd analyze each area, then narrow down to *potential root causes*. For example:

  (i) Cardio: Lack of intensity or variation;

  (ii) Muscle strength: Incorrect weight or incomplete muscle group engagement; and

  (iii) Flexibility: Consistently overlooking stretching.

- This level of specificity helps you to develop a *targeted plan* for each of the 3 areas of fitness, to deliver much better results than simply trying to "be more disciplined" or to "train more".

Part 2: Using the Problem-Solving Steps and Tools

Let's break down the 4 problem-solving steps into sub-parts, along with the tools you can use in each phase. Then, we'll illustrate them with 2 detailed examples.

Breakdown of the Problems-Solving Steps with Suggested Tools

Step 1: Understand the situation so you can define the problem clearly and specifically.

KEY QUOTES

"The value of problem-solving oriented thinking obviously extends far beyond the classroom into every facet of our lives. It enables us to take control of the challenges we encounter and to change the world in a positive way."

Step 2: Identify the root cause of the problem. List down all potential root causes, and develop a hypothesis for the most likely root cause.

- *List down all possible root causes*, using a Logic Tree or a Yes/No Tree to systematically brainstorm possible causes.
- Develop a hypothesis for the *most-likely root cause*.
- Define the *data/analyses* needed to test the hypothesis. You can use a Hypothesis Pyramid to structure your assumptions and what you must do to validate them.
- *Test the hypothesis* to identify the root cause.

Key tools: Logic Tree, Yes/No Tree, Hypothesis Pyramid.

Step 3: Develop an effective action plan.

- Generate a *wide range of solutions* to the problem using the Logic Tree.
- Evaluate these options using the (i) Pros and Cons Grid and/or (ii) Criteria-Evaluation Table, and *prioritize the best actions* using the Prioritization Matrix.
- Organize these into an *effective action plan*.

Key tools: Logic Tree, Pros and Cons Grid, Criteria and Evaluation Table.

Step 4: Execute until the problem is solved, making adjustments as required. Monitor your progress and adjust the plan based on real-time feedback, learning from both successes and failures.

Your Problem-Solving Toolkit: Key Tools Explained

A logic tree helps you to (i) visualize the potential root causes of a problem, (ii) generate possible solutions systematically, and (iii) organize them into categories.

- State the *main problem* on the left.
- Then, branch out into possible solutions, ensuring *no overlap and no omissions between categories*. In other words:

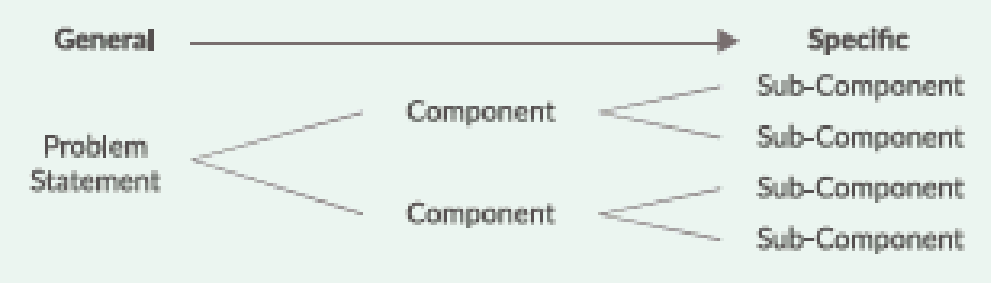
KEY QUOTES

"The better you get at understanding the symptoms and identifying the root causes, the better you will get at developing effective solutions."

"Even if the problem you face is big and complicated, if you learn how to break it down into smaller, manageable problems, you will be able to solve it."

(i) Make sure that each item in a category is mutually-exclusive (i.e. the items don't overlap); and

(ii) The logic tree is comprehensive enough to cover all possible categories/aspects of a problem (i.e. nothing is left out).



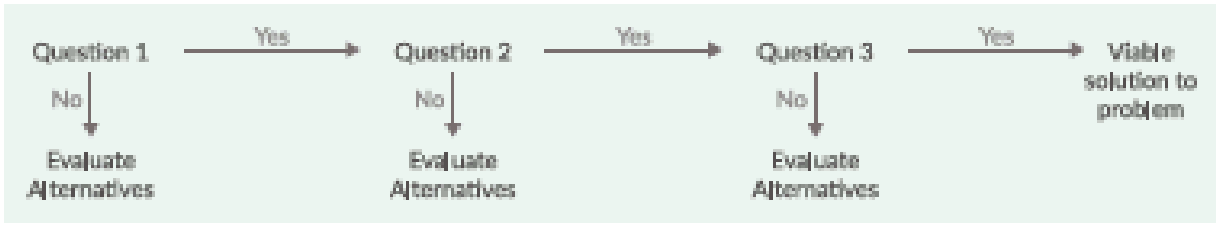
- *Expand the solutions* in each brach or subcategory by asking: What? How? Where? When? Who?
- Try *drawing or visualizing* the logic tree to shift your perspective and deepen your understanding of the problem.
- *Expand the tree horizontal and vertically*:

  (i) Expand vertically by asking if there are other ways of solving the problem.

  (ii) Expand horizontally by asking if there are other aspects to the category.

- Keep *adapting and adjusting* your logic tree, organizing them from general (left) to specific (right), and grouping similar topics together.

A yes/no tree helps to ensure you've explored all potential solutions, and also guides decision-making. Keep asking yes/no questions until you find a viable solution.

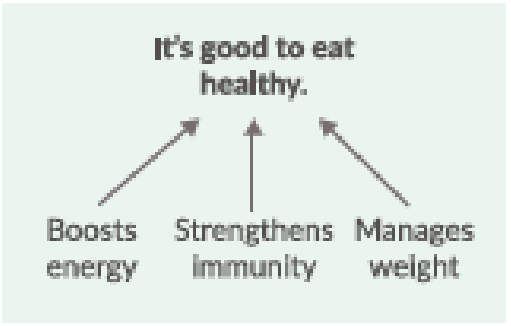


The clearer and more specific your hypotheses, the better you can test them to find an ideal solution. Here are several tools to help you structure your argument, and specify your rationale and conclusions, before you start to collect and analyze data. They also make it easier for you to communicate your hypothesis. You can:

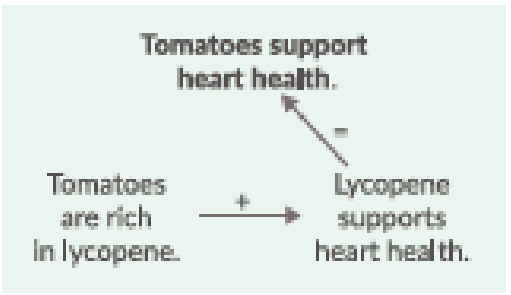
KEY QUOTES

"You have to keep asking the "why" and the "how" to develop a custom-made action plan."

- Use a *hypothesis pyramid* by placing your hypothesis or conclusion at the top, with the supporting reasons below (why, what, where, how, who).



- Use a logic model (or an *argument structure*) to list down the statements that need to be true in order for the hypothesis or conclusion to be true.



- Create a *problem-solving design plan* to detail the problem to be solved, the hypothesis and rationale, and a list of actions and information needed to test the hypothesis. This is a dynamic document that evolves with each step of the problem-solving process.

Here are 2 additional tools to help you organize your information and thoughts. Remember: you can always brainstorm options to address specific challenges or shortcomings for each option.

- A *pros and cons grid* helps you to consider both the pros (positive aspects) and cons (negative aspects) of each option.

  (i) List all the options.

  (ii) List the pros and cons for each option.

  (iii) Weigh each of the options.

  (iv) Select the best option.

Options	Pros	Cons
Option 1	+ Factor 1 + Factor 2	- Factor 1
Option 2	+ Factor 1	- Factor 1 - Factor 2 - Factor 3

- A *criteria-evaluation table* helps you to consider each option against your criteria and their relative importance.

  (i) List all the options.

  (ii) List the evaluation criteria. Weigh each of the options.

Criteria	Importance of Criteria	Option 1	Option 2
Criteria 1	High	*****	***
Criteria 2	Med	*	*****

  (iii) Define the weightage for each criteria (e.g. Low/Medium/High).

  (iv) Evaluate each option based on the criteria (e.g. 1-5*).

  (v) Choose the best option.

KEY QUOTES

"Challenge your own thinking processes and your conclusions."

Example 1: Increasing Customers to a Pop-Up Food Stand

An enterprising student, Mimi, had a pop-up hot-dog stand in school and wanted to increase her number of customers.

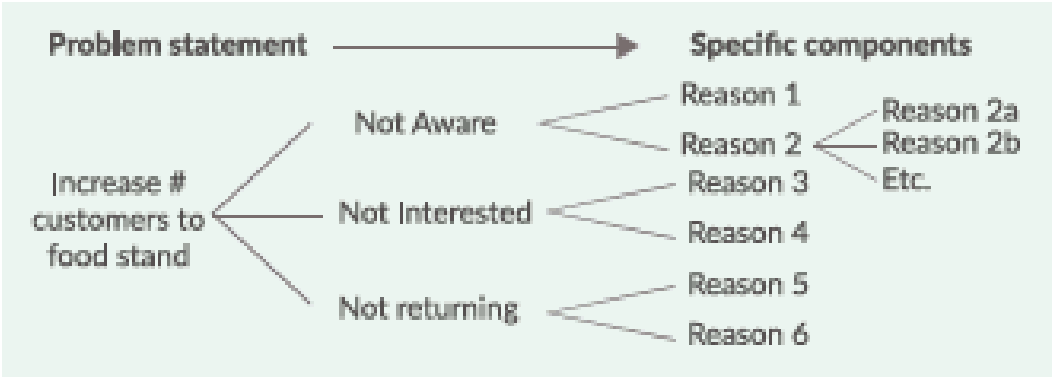
She started with Steps 1 and 2: Defining the problem and the possible root cause(s).

- Using a *Logic Tree*, she brainstormed potential causes for the low sales.

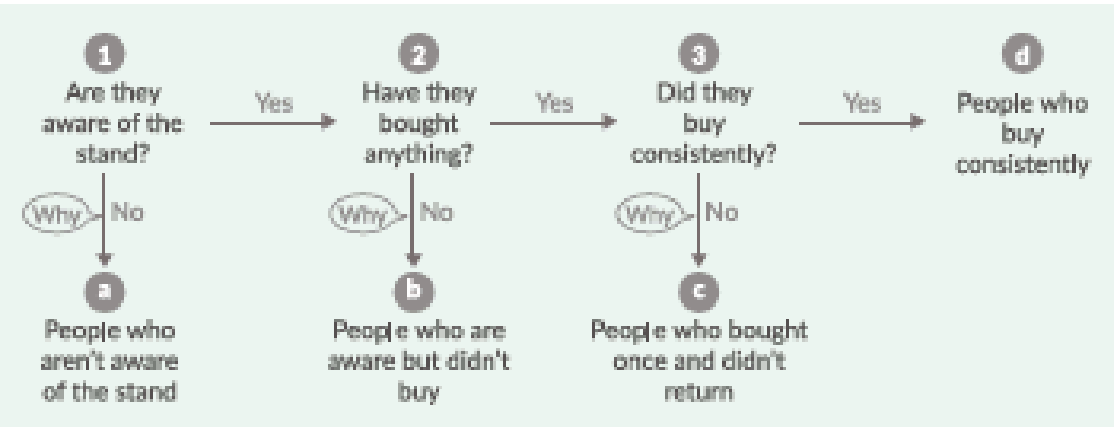
  (i) Lack of awareness (people didn't know about the food stand).

  (ii) Lack of interest (they were aware, but didn't buy).

  (iii) They tried the food but didn't return.



- To ensure she has covered all scenarios, she also used a *Yes/No Tree* to explore the problem:



- Using the tools above, she brainstormed the possible reasons for the low sales at her food-stand, then made a best-guess of the *most likely root cause*. She hypothesized that the root cause was a lack of awareness. Specifically, she estimated that (i) only 10% of the students knew about the stand, of which (ii) 50% would buy and (iii) 80% would return.

KEY QUOTES

"Don't forget that the point of all this research is to help you make informed decisions."

Next, she defined the information needed to test her hypotheses, including the most efficient and effective way to collect the data.

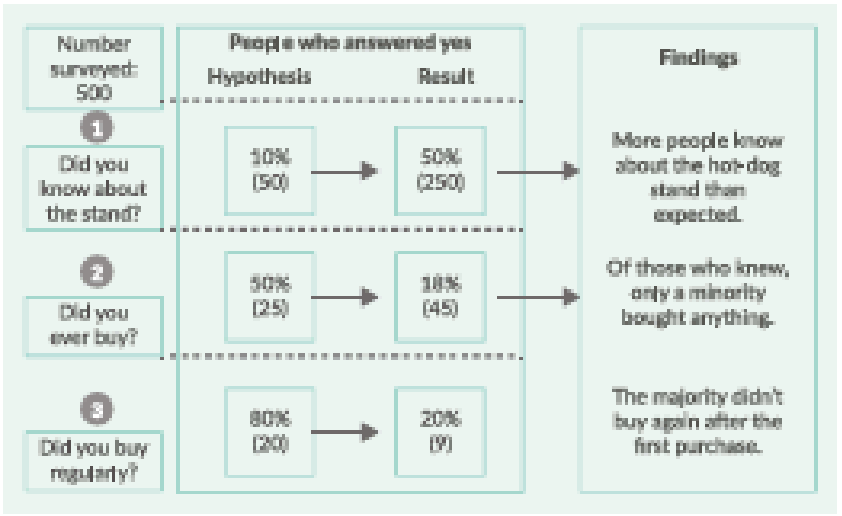
- She captured these in a *problem-solving design plan*:

Issue	Hypothesis	Rationale	Analysis/ Activities	Information Source
How many people are in each category?	Most people don't know about the stand	I haven't told many people about it.	Ask teachers to do a quick survey in class	Survey
Why are people who're aware not buying?	They don't like hot dogs	There's no other hot-dog stall in school.	Talk to 5 people who know but didn't buy	Interview
Will people want to keep buying?	Once they've tried, most will keep buying	Who doesn't like hot dogs? And my hot dogs are good!	Talk to 5 people who bought: will they buy again and why?	Interview

(i) For example, to find out the size of the 3 categories above, she asked her teachers for help, instead of doing individual surveys (which would be time-consuming). The teachers only had to ask 3 questions in class and count the number of students who raised their hands: Who knows about Mimi's food stand? Who has bought something from the stand? Who has bought something every week?

(ii) To understand (a) why people who knew about her stall didn't buy, and (b) what she should do to get more regular customers, she asked the teachers to jot down several names of people in both groups so she could interview them later.

By testing her hypotheses, she realized that many more people knew about her stall (50%) than she expected, and she used interviews to find out why people weren't buying or returning.



KEY QUOTES

"You don't have to figure everything out on your own. Look for information to help you make the best decision in the given time."

- *People weren't buying mainly because* (a) they didn't like hot dogs, or (b) her stall was only open on Friday after school, when the students wanted to hang out elsewhere.

- Those who tried her hot dogs but *didn't buy again* wanted more variety, such as different sauces or sides (e.g. fries or nuggets).

With the new insights, Mimi generated possible solutions for each of the 3 categories.

- Using the logic tree, she explored a wide range of solutions, then narrowed down to ideas that concurrently (i) increased awareness and (ii) made people want to buy. Here are 2 examples:

Who	Idea	Creates awareness?	Gets them to buy repeatedly?
Mimi	Give out flyers with promotions.	✓	✓
Customers	Bring a friend to get a free hot-dog.	✓	✓

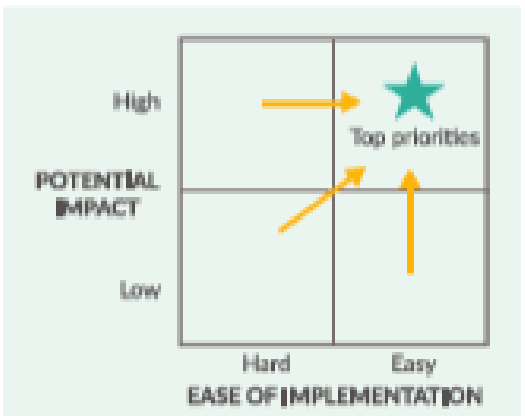
Then, she developed an implementation plan.

- She *prioritized the ideas* based on impact and ease of implementation, in this sequence:

  (i) Top-right box (high impact, easy to do);

  (ii) Top-left or bottom-right boxes;

  (iii) Bottom-left box (low impact, hard to do).



- With some brainstorming, she also managed to *shift more items to the top-right box*. For example, she didn't know how to design flyers, but found a friend who'd do it for her in exchange for free hot dogs.

Finally, she executed the plan, refining it as she went. Within the first 2 months, awareness increased to 80%, first-time

KEY QUOTES

"You can accomplish more by collaborating with others who have strengths you may lack."

purchase increased to 50%, and repeat purchases to 40%. This meant a total of 200 customers each month, of which 80 were regular customers!

Example 2: Learning Roadmap for a Career Switcher

Alex was an experienced marketing manager who aspired to transition into data science. He broke down this ambition into smaller parts, and decided that his first step was to acquire the necessary skills through a reputable training program. To do so, he must choose an ideal course that fit with his budget and learning objectives.

Alex started by setting a clear, specific goal: to enroll in a part-time data science bootcamp within 6 months, ensuring the course (i) met his career needs, (ii) could be completed while holding his full-time job, and (iii) was within a budget of $3,000.

Next, he assessed the gap between his goal and current situation, including:

- His current *knowledge and skills*, and the specific gaps in data science expertise he wished to fill;
- His *available hours* each week; and
- His *financial situation*: with estimated savings of $300 per month, he needed an extra $1,200 [$3,000 – ($300 x 6)] for the course.

He shortlisted available courses, then used the following tools to compare and choose his ideal course:

- *Pros and cons grid*: to compare his top 5 options and narrow them down to 2.
- *Criteria-evaluation table*: He used this to compare the top 2 courses, taking into account factors like course content quality, flexibility, post-course support, and cost.

KEY QUOTES

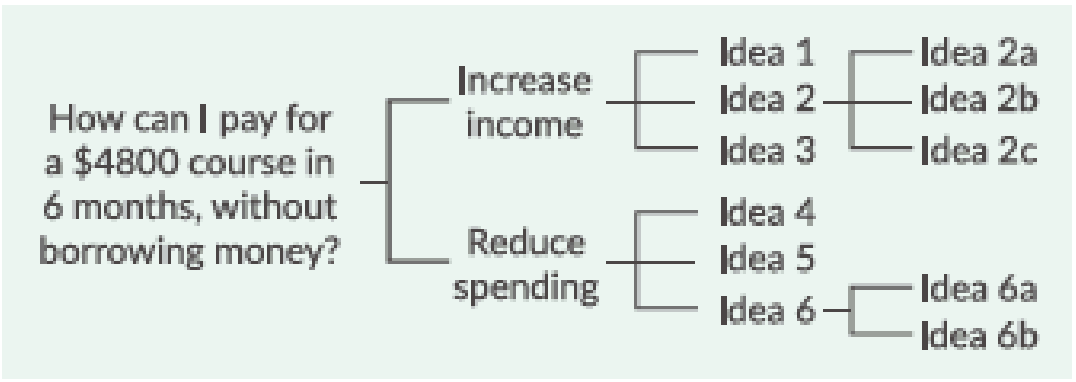
"The more specific the goal is, the more specific the action plan will be."

Criteria		Importance of criteria	Option 1	Option 2
Quality of Course	Covers all major topics?	High	All topics covered	All topics covered
	Has a mix of concepts + hands-on learning?	High	Mainly classroom learning.	Includes real-world projects
	Networking Opportunities?	Medium	Online forums	Alumni events & online community
Budget	Falls within $3000?	High	$2799	$4800
Class schedule	Flexible learning hours?	Medium	Mainly online learning/ videos	Online learning + compulsory review & project sessions
	Less than 6 hours per week?	Low	Mainly lessons & quizzes	Extra simulations, presentations, and industry engagements

- Initially, Alex was leaning toward Option 1 as it covered all the essential topics, and fit both his budget and schedule. However, after doing further research and speaking with alumni and industry experts, he realized that the hands-on experience and networking opportunities from Option 2 would greatly benefit his career transition, even though it required more time and money.

Using separate logic trees, Alex explored possible options/ ideas to (i) meet his education budget, and (ii) free up more time without compromising his job.

- For example, he brainstormed ways to meet his education budget by (i) increasing his income (e.g. taking on side gigs), and (ii) reducing expenses (e.g. cutting down on meals at restaurants).

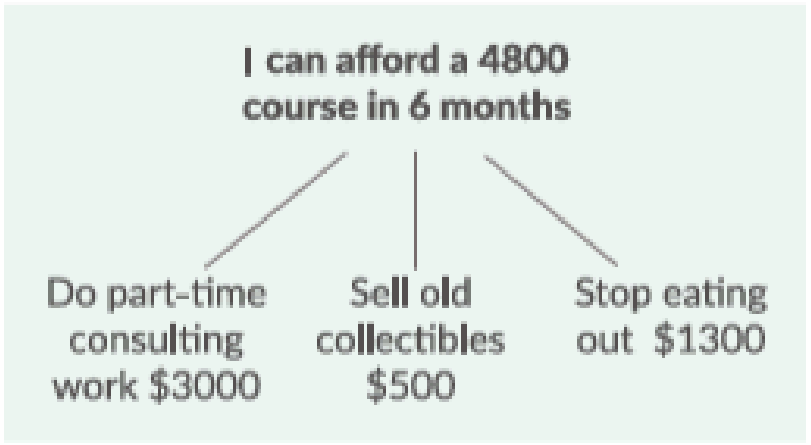


- He also did online research and spoke with friends, colleagues, and alumni members for *ideas to effectively manage the part-time course* while holding his full-time job.

KEY QUOTES

"Problem solving is easy when you know how to set a clear goal, figure out how to reach it, and follow through while reviewing your progress and making changes to your plan as necessary."

From there, he formed his hypothesis on the best ways to close the gap and achieve his goal. For example, he identified the top 3 ways to close the budget gap as: freelance consulting projects, selling old collectibles and reducing expenses on gadgets and restaurants.



Now, he had to test his hypotheses:

- *Closing the budget gap*:

  (i) He researched the market rate and demand for freelance marketing consultants, and found it to be much more competitive than expected. He adjusted his projections to $1000 instead of $3000.

  (ii) After putting his collectibles online, he was pleasantly surprised to receive quotes of up to $2000.

  (iii) After tracing his expenses, he realized he could save only $500 from cooking instead of eating out, which might not be worth the hassle. Instead, he could save the same amount just by cutting back on beer alone.

  (iv) In addition, he contacted the course organizers, and was excited to learn that he could qualify for an alumni-sponsored partial scholarship aimed at career-switchers like him, halving the cost to just $2400!

- Additionally, Alex negotiated a *flexible work arrangement* with his employer for 3 days each week when he had to attend his course. He presented a case on how his training would bring data-driven decision-making skills to benefit his current role, and how he would complete his work remotely on work-from-home days.

With flexible work hours, a scholarship and additional income from the collectible sales, Alex only had to save an extra $400

KEY QUOTES

"Luck is what happens when preparation meets opportunity."
—Seneca

"Spend less time worrying about things and more time thinking about actions you can take to get closer to your goals, then actually take action."

by reducing beer consumption. He was now ready to execute his final plan, enroll in the data science program, and start taking his first steps toward his dream career of a data scientist.

Conclusion and Other Details in the Book

As we saw in the 2 examples above, you can solve problems and achieve your goals more effectively by researching the problem, exploring the issues and solutions, planning and testing your hypotheses, asking for help, and constantly challenging your own thought processes and conclusions.

The book is full of illustrations, charts, tables, and examples to bring the ideas, steps and tools to life. Specifically, Ken Watanabe presents 3 detailed case studies of:

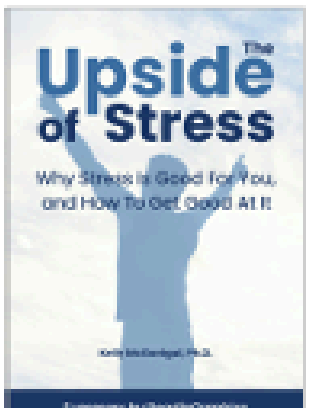
- *The Mushroom Lovers*: A new rock band that wanted to improve their concert attendance;
- *John Octopus*: A young man who aspired to become a computer graphics animator and Hollywood movie director, and needed to buy a computer to start learning CGI; and
- *Kiwi*: a soccer player who wanted find the best school in Brazil to hone her soccer skills and become bilingual/ bicultural.

About the Author

Ken Watanabe grew up bilingual in Japan and studied in the United States at Yale and Harvard Business School. He was a management consultant at McKinsey & Company for six years. He is now the founder and CEO of his own education, entertainment and media company, Delta Studio.

KEY QUOTES

"If you make problem solving a habit, you'll be able to make the most of your talents and take control of your life. You can solve not only your own problems, but the problems of your school, your business, and your community—and maybe even the world."



THE UPSIDE OF STRESS

Why Stress Is Good for You,
and How to Get Good at It

KELLY MCGONIGAL, PH.D.

The Big "So What"

Most people believe that stress is bad and should be avoided. In this book, health psychologist Kelly McGonigal presents scientific evidence that stress can improve your performance, physical and psychological health. She also shares various strategies and interventions to help you thrive under pressure, and manage physical symptoms of anxiety.

Introduction

Like many others, McGonigal used to think that stress is toxic. However, after researching stress in detail—through empirical research, interviews with scientists and researchers, experiments and interventions—she realized stress is harmful only when you believe it is.

- For example, 30,000 adults in the U.S. were asked if they thought stress hurt their health. 80 years later, those with high stress levels were 43% more likely have died—*only if* they had believed that stress was bad for them. Those who experienced high stress but didn't see it as harmful actually had the *lowest* risks of death. In short, stress alone doesn't kill people; the danger comes from the *combination of stress and the belief that it's harmful*.

- McGonigal has since combined psychology, neuroscience, and biology to create the "New Science of Stress" course being taught at Stanford, to help people thrive under stress. This book is based on the *insights and strategies* from the course, presented in 2 parts:

  (i) How to change the way you think about stress; and

  (ii) On-the-spot strategies to apply when you're stressed.

KEY QUOTES

"The latest science reveals that stress can make you smarter, stronger, and more successful. It helps you learn and grow. It can even inspire courage and compassion."

"I've changed my mind about stress, and now I want to change yours."

Part 1: Rethinking Stress

The first step to transforming stress is to change how you think about it. The word "stress" is used by people to describe everything from a minor frustration to a major trauma. McGonigal defines stress as "what arises when something you care about is at stake."

The Power of Mindsets

Many research studies have found that our beliefs can affect our physical outcomes:

- In a study, housekeepers who were told that their work was a form of exercise *lost weight and body fat* after 4 weeks. Housekeepers who were only told the importance of physical exercise didn't experience such weight/fat loss.

- In another study, 2 groups of people were given the same milkshake. However, the 1st group thought it was a high-calorie, high-fat milkshake, while the 2nd group thought it was a low-calorie, zero-fat milkshake. After consuming the milkshake, the 1st first group was found to have 3x less *hunger hormones* (ghrelin), i.e. they felt full because they *expected* to be full.

- Beliefs about *aging* were found to affect people's rate of recovery after a health challenge or accident, and even their longevity. People with a positive attitude toward aging tend to live longer.

Mindsets are your core beliefs about how the world works, e.g. "the world is a dangerous place", "money can't buy you happiness", or "people can't change".

- Your mindset affects how you think, feel and act, which influence your outcomes, to further reinforce your mindset. So, even a short, one-time *mindset intervention* can catalyze changes to produce a snowball effect with far-reaching consequences.

KEY QUOTES

"Small shifts in mindset can trigger a cascade of changes so profound that they test the limits of what seems possible."

- For example, a group of freshmen received a mindset intervention targeting their sense of *social belonging*. They were told that it's normal to feel like you don't belong, and the feeling will fade. Then, they were asked to read excerpts from others' experiences, write an essay on their own experience, and read their essay in front of a camera. In the next 3 years, students who received this intervention experienced better physical health, academic performance and happiness, compared to those who didn't. Most of them forgot the details of the intervention, but the message stuck and influenced their behaviors (e.g. how they handled problems or connected with others) to create a long-term, ripple effect.

- Mindset interventions are similar to *placebos*, except the effect is longer-lasting. Placebos are effective even when patients know that they're taking sugar pills instead of real drugs, if the doctors explain how placebos work. Likewise, mindset interventions work even when participants know they're going through an intervention.

Your thoughts/beliefs about stress affect your **physical and biological realities**.

- During times of stress, our body releases *2 hormones*— cortisol and dehydroepiandrosterone (DHEA).

  (i) When you're stressed, your body burns fat and sugar for energy. *Cortisol* enhances your ability to use that energy, but also suppresses certain biological functions (e.g. digestion, reproduction, growth). *DHEA* helps your brain to learn from the stressful experience, and also counters some of cortisol's effects, e.g. it strengthens your immune system and speeds up wounds recovery.

  (ii) You need both hormones, but the ratio of DHEA to Cortisol (called the *growth index*) affects the long-term impact of stress. People with a higher growth index tend to thrive under stress, and are less prone to stress-related diseases like depression or heart disease. Those with a lower growth index are more prone to depression, poorer immunity, etc.

- In a study, participants went through an interview designed to generate stress. Before the interview, each

KEY QUOTES

participant watched a video that either said (i) stress enhances performance or (ii) stress is debilitating. After the stressful interview, both groups saw an increase in cortisol levels. However, the participants from the 1st group had higher DHEA levels compared to the 2nd group. In short, the belief that stress is enhancing improved their *growth index*.

The Biology and Psychology of Stress

- The flawed belief that "stress is bad" can be traced back to Hans Selye, an endocrinologist. In 1936, Selye found that when lab rats were exposed to trauma (e.g. injected with substances, exposed to extreme heat/cold), they developed ulcers, physically deteriorated and died. He called this "stress".

  - Later, Selye hypothesized that stress also contributed to many symptoms in human patients (e.g. loss of appetite, fatigue) and ailments (e.g. heart attacks, allergies). He defined stress as "the response of the body to any demand made on it"—a definition that much broader than the extreme trauma/abuse experienced by the lab rats. In short, Selye's hypothesis was never proven, and his conclusions were drawn from lab animals under *drastically different conditions* from our daily human stresses.

  - Selye's work on the toxicity of stress was so widely acclaimed that he was nominated 10x for the Nobel Prize. He later acknowledged that that *not all stress is bad*, and even started to differentiate between good stress (eustress) and bad stress (distress). However, the label "stress is bad" had stuck.

- It's also wrongly assumed that stress will always trigger the "fight-or-flight response". This term was first coined by physiologist Walter Cannon in 1915, to describe the state of heightened sympathetic activation when animals faced a live-threatening situation. This response may also be triggered in humans. However, it's just one of humans' many possible stress responses. Your body responds to stress in complex ways, depending on (i) the nature of the

KEY QUOTES

stress, (ii) your past experiences, and (iii) your interpretation of the situation.

- When you're stressed, the body *unlocks energy and heightens your senses/focus* to help you cope with the situation.

  (i) When a *fight-or-flight* response kicks in, your breathing deepens to give you more oxygen, your body burns more fat and sugar for energy, the stress hormones facilitate the use of that energy, and your heart rate increases to deliver the oxygen/energy to your muscles/brain. Your pupils dilate and your hearing sharpens to heighten your focus. You also get a boost of motivation, power and confidence from biochemicals like endorphins, adrenaline, testosterone, and dopamine. In this state, you're driven by primal instincts instead of rational thought. The response can be so drastic that people have been known to exhibit extraordinary strength, e.g. 2 teenage girls managed to lift a 3000-pound tractor off their father.

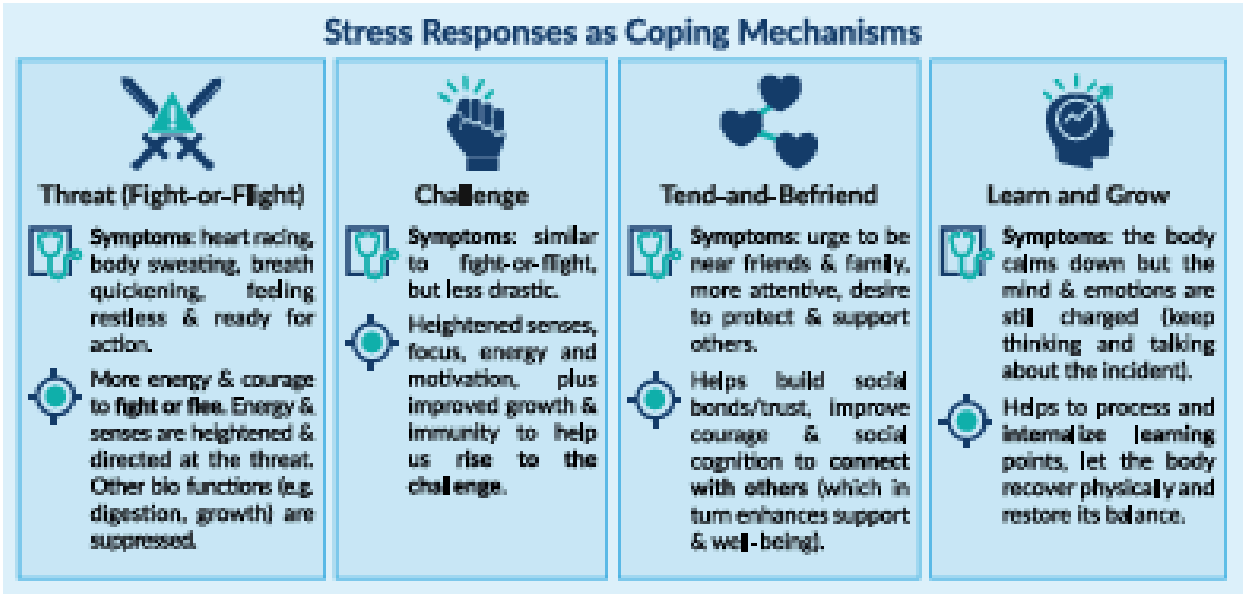
  (ii) However, in less stressful situations, your body usually adopts a moderate *challenge response*. You'll still have increased energy and focus, but your DHEA levels will be higher than your cortisol levels. Instead of operating from fear, you enter a growth state. People in a state of "flow" (i.e. enjoyably absorbed in a challenging task) are actually displaying a challenge response.

- Stress may also trigger your desire for *social connection* or the *tend-and-befriend response*. This comes mainly from oxytocin, which is also known as the "love hormone". Oxytocin helps to build social bonds, empathy, and trust. It also counters the debilitating effects of fear, improves cardiovascular health, and gives you the motivation/ courage to protect others. So besides the desire to connect with people, you're more likely to stand up for a colleague or protect your loved ones. After a traumatic event or personal crisis, people tend to become more caring and altruistic because caring for others creates a sense of courage and optimism, and dispels feelings of fear and defeat.

KEY QUOTES

"Your stress response has a built-in mechanism for resilience—one that motivates you to care for others while also strengthening your physical heart."

- Stress also helps you to *learn and grow*. As your body starts to calm down, your stress hormones help you to recover faster. For example, cortisol and oxytocin help to reduce inflammation and restore balance to the nervous system, while DHEA helps to increase the brain's neuroplasticity to help you learn from the experience. That's why we tend to feel mentally and emotionally charged for some time after a stressful event. You're likely to replay the scene in your head, or feel the urge to tell someone about the incident.



In short, stress isn't "bad" and stress hormones are your body's way of helping you to cope with stressful situations. Survivors of an accident are less likely to develop post-traumatic stress disorder (PTSD) if they have a higher level of stress hormones (cortisol and adrenaline) just after the accidents. Patients who received stress hormones just before a traumatic surgery spent less time in intensive care and had fewer traumatic symptoms post-surgery.

In fact, stress goes hand-in-hand with a meaningful life.

- A Gallup World Poll found that a country's stress index was correlated with its people's well-being (life expectancy, GDP, happiness and life satisfaction). In fact, high levels of stress were associated with *both* higher levels of distress (including anger, sadness, worry etc.) and well-being (e.g. joy, love, laughter). McGonigal calls this the *stress paradox*. For example, parents with children below 18 are more stressed, but also laugh and smile more. Entrepreneurs are both stressed and fulfilled by their steep learning curve.

KEY QUOTES

"Stress leaves an imprint on your brain that prepares you to deal with similar stress the next time you encounter."

"The stress response is more than a basic survival instinct. It is built into how humans operate, how we relate to one another, and how we navigate our place in the world."

"A meaningful life is a stressful life."

- So, stress isn't a sign that something's wrong with your life; it's a sign that you're *meaningfully engaged* in things you care about. People who're busier tend to be happier, and people with a sense of purpose tend to live longer.

- In a study, students were tasked to keep journals over a winter break. One group wrote about their most important values (and how their daily activities supported those values). The other group wrote about the good things that happened to them. At the end of the break, the first group reported better health, confidence and motivation. *Writing about their values* helped them to see their daily activities as a expression of their values instead of burdens/hassles. Similar results were found in many other studies: by changing how you see your daily activities, you can motivate positive action and improve your self-identity.

Using Interventions to Change your Stress Mindset

Your stress mindset (whether you believe stress is harmful or helpful) tends to create a self-fulfilling prophecy. When you think of stress as a resource and actively confront your challenges, you develop new skills and resources to improve your results, competence and confidence in a virtuous cycle. When you deny or avoid the stressful challenges, the reverse happens.

- Psychologist Alia Crum did a stress mindset intervention with financial workers during the 2008 financial crisis. Participants were split into 3 groups. The 1st group was taught the positive effects of stress, the 2nd group was taught the harmful effects of stress, and the 3rd group received no training. Participants were surveyed before and after the training. After the intervention, people in the 1st group had a more balanced view about stress, were less depressed/anxious, reported fewer health issues and enjoyed more focus, engagement, collaboration, and productivity. The other 2 groups showed no behavioral changes.

- In another study, participants were invited to a *stress-management* training. Half the participants received a intervention while the rest were put on

KEY QUOTES

"Happy lives are not stress-free, nor does a stress-free life guarantee happiness."

"Stress and meaning are inextricably linked. You don't stress out about things you don't care about, and you can't create a meaningful life without experiencing some stress."

waitlist. During the intervention, participants were told the harmful and beneficial effects of stress, the power of mindset, and that the training aimed to help them choose a positive mindset. They were then asked to reflect on their own experiences with stress, and taught a 3-step process to apply when they were stressed. 3 weeks later, the participants demonstrated a more balanced view about stress, reported less anxiety/depression, and had better health, focus and engagement. The effects remained after 6 weeks. Employees on the waitlist showed no changes until they went through the intervention.

You can shape your stress response and transform your mindset using similar interventions or exercises:

- *Rethink your stress response*: Think of a recent stressful experience. Refer to the list of stress responses above, and write down the elements that were present during/ after the experience, e.g. sweaty palms, the urge to call a friend. What did you associate with these elements? What helpful role could they have played?

- Reflect on the link between *stress and meaning in life*: List down the most meaningful aspects of your life (e.g. relationships, activities, goals). What feelings do they bring? Are they also somewhat stressful? Would you rather be stress-free or lose that aspect of your life?

- *Consider your values*. List down the values that are the most important to you, identify the top 3, then write about at least one of them for 10min. Describe why the value is important, how it guides your decisions, and how you express it in your daily life. The next time you're stressed, use this to remember why you do what you do. You can also carry a physical reminder, e.g. a keychain or post-it note with your key values.

Instead of complaining about stress or fantasizing about a stress-free life, try talking about stress to cultivate mindset mindfulness.

- When we avoid stress or try to forget the stressful moments, we're also cutting out the meaningful life experiences, creating additional stress while removing the resources that'd have helped us to cope. Physicians who shared their work experiences daily became more mindful

KEY QUOTES

"Remembering your values can help transform stress from something that is happening against your will and outside your control to something that invites you to honor and deepen your priorities."

"Although avoiding stress can seem like a rational strategy, it almost always backfires."

of their thoughts/feelings and found new meaning in their struggles at work. After 1 year, the physicians' depression and anxiety levels fell by two-thirds, and they felt more empathy for their patients.

- Reflect on the *cost of stress avoidance*: What roles/ activities have you rejected because they seemed stressful? What substances/distractions do you use to escape unpleasant thoughts/feelings? What would you do/experience/change if you weren't afraid? What does avoiding stress truly cost you?

Part 2: Transforming Stress

Stress is unavoidable, and the strategies in this section will help you to transform stress from a debilitating factor to a useful resource. Being good at stress isn't about avoiding it or being untouched by it. It's about using stress to tap into your natural strengths and resources, so you're more likely to adopt a constructive response, instead of becoming withdrawn, aggressive or defensive.

- During times of stress, pause to *consider what you need most*, e.g. to survive, perform, connect, or learn. Your body will respond based on your expectations.

Transforming Threats to Challenges

A challenge response is better than a flight-or-flight response (or threat response) for performance enhancement. Not only does it increase your energy and focus, it also improves your performance, resilience and health.

- If you think that you lack the resources to deal with a challenge, you're more likely to feel threatened and lapse into a threat response. To *shift to a challenge response*, focus on your resources, including your strengths, past successes/preparation, and your body's natural stress responses.

KEY QUOTES

- The *Trier Social Stress Test* used events like public speaking and math tests to create stressful situations that increased participants' stress hormones by up to 400%. A mindset intervention was applied before the test: the 1st group was told that stress could be used to boost performance, the 2nd group was told that stress was best ignored, and the last group received no tips about stress. During the tests, the 1st group was more confident, demonstrated more physiological stress arousal, better focus and performance. The last 2 groups showed no difference in performance.

You can transform anxiety into a resource for performance.

- Students who were told that pre-exam anxiety can help them to perform ended up doing better in a mock exam despite higher levels of stress activation, i.e. they were able to *leverage their stress*.

- The next time you notice signs of stress (e.g. racing heart, sweaty palms), don't force yourself to relax or suppress your anxiety. Instead, *direct the energy constructively*:

  (i) Remind yourself that stress is your body's way of equipping you to cope with the challenge.

  (ii) Tell yourself that you're excited or motivated, and use that energy to rise to the challenge.

  This approach works for various situations and people, including the under-privileged and those with psychological disorders.

Building Resilience through Social Connections

Stress can bring about caring-befriending behaviors or aggressive-selfish behaviors, though the former is much more helpful.

- *Tending and befriending* helps to transform stress by increasing 3 types of brain activity to make us more social, brave and smart.

  (i) Oxytocin makes us more empathic, trusting and sociable;

KEY QUOTES

"When you stop resisting it, stress can fuel you."

"If you have butterflies in your stomach, invite them into your heart."
—Cooper Edens

"Whatever the sensations of stress are, worry less about trying to make them go away, and focus more on what you are going to do with the energy, strength, and drive that stress gives you."

(ii) Dopamine gives us a "rush" that dampens fear, increases optimism, and primes us for action; and

(iii) Serotonin increases our sense of perception, intuition and self-control to help us identify the right solutions.

To switch to a tend-and-befriend mindset:

- Focus on *bigger-than-self goals* that positively impact others, and consider how your current activities can serve those goals.

  (i) People who focus on a higher purpose tend to feel more inspired, curious, grateful and energized, build stronger networks and feel more satisfied with life. Those who focus on self-centered goals (e.g. promotions or awards) tend to feel more confused, anxious, envious and lonely.

  (ii) A group of bus drivers reimagined their role to make the bus a place for people to feel seen and known. When passengers boarded the bus, the drivers greeted them, made eye contact and said hello. This simple shift significantly increased the drivers' job satisfaction and reduced risks of burnout.

  (iii) Students who took time to reflect on bigger-than-self goals showed improved academic motivation and performance, and persisted longer in face of challenges.

- Look for ways to *help/support others*. By giving your time/help instead of withholding it, you'll actually feel less overwhelmed.

  (i) By measuring human brain activity, researchers found that people who comfort/help others also experience hope and connection, whereas those who focus on removing their fears only became more fearful.

  (ii) Time-strapped people who spent their free time helping others ended up feeling less time-constrained, more capable and useful, compared to others who used the free time on themselves. After a spouse's death, people are less prone to depression if they take care of others. Survivors of a natural disaster are less

KEY QUOTES

"Helping others doesn't make you live forever, and it can't protect you from everything. But what it does protect you from is stress."

prone to PTSD if they help others in the aftermath. Even prison inmates thrived when they were given caregiving opportunities.

- If you isolate yourself when you're stressed, you can get stuck in a downward spiral. To make a mindset shift, recognize your pain as part of a *common human experience*:

  (i) In a group, get everyone to write down something they've been secretly struggling with. Then, mix the entries up, and get each person to read a random entry aloud. This allows us to see others' invisible pain, while protecting their anonymity.

  (ii) On your own, reflect on your thoughts/feelings (e.g. pain, anger, self-doubt) about a situation. Consider how others may also feel similar pain/suffering. End the reflection with a phrase that captures your shared experience, e.g. "May we all know our own strength" or "May we all find peace."

- Take the first step to *create the supportive community* you wished you had. Don't wait for others to reach out first. If you wish to feel appreciated, then start by expressing your gratitude. If you want a sense of belonging, then help others to feel welcome.

Growing from Adversity

There's extensive evidence of mankind's ability to grow through adversity. The most significant personal growths in your life probably also occurred during times of stress.

- There are many stories of people who experienced extreme trauma yet rose above it. *Post-traumatic growth* has been observed in all sorts of trauma, e.g. abuse, terrorist attacks, or life-threatening diseases. Survivors may transform their lives as they uncovered inner strengths, experienced spiritual growth, found a new calling, or found deep, meaningful relationships.

- Trauma is never good, but it can activate one's strengths, values, and responses to bring good outcomes. We

KEY QUOTES

"Sometimes, we make the choice to be generous first, and the uplift comes later."

can't avoid pain and adversity in life, but we can choose our responses to them.

Psychologist Edith Chen found that people with a difficult childhood could resist the toxic environment with a "shift-and-persist" strategy. *Shifting* is about changing how you think about the stressful situation, e.g. believing that good can come out of it, or focusing on what you can learn. *Persisting* is about finding meaning in adversity, e.g. believing that things will get better or you have a purpose on earth. To adopt this strategy:

- Think of a *stressful experience* where you persevered or grew. Take 15min to write about the strengths/resources you drew on, the actions you took, how you dealt with adversity, and how you grew stronger.

- Think of a challenge you're struggling with. Consider the strengths/resources you can draw on, the skills/strengths you wish to develop, and how you can use this situation as an *opportunity to learn and grow*.

You can choose to see the upside in any situation. Yet, it's hard to do so when you're in the midst of a stressful situation, e.g. if you've been diagnosed with cancer. Train yourself to **pause and find benefits in a stressful situation**, so you can shift your physical, mental and emotional states and activate effective coping strategies.

- Take 2 minutes to consider the potential benefits of your current situation, e.g. how you could learn, grow or become stronger from it. Common benefits from adversity include: appreciation of life, spiritual growth, sense of personal strength, social connections, or new life directions. This *2-min mindset intervention* can activate parts of the brain associated with positive motivation and active-coping, to help people to feel less angry, more joyful, grateful, and in control.

- *Longer-term interventions* include: daily reflections or journaling about your difficult situations, or keeping a diary of your positive daily experiences.

Spreading growth and resilience. Research found that watching the news after a natural disaster or terrorist attack tends to increase the risk of depression or PTSD. Even

KEY QUOTES

"We cannot always control the stress in our lives, but we can choose our relationship to it."

watching TV talk shows can increase fear and anxiety levels. Yet, research also found that people can be inspired by stories of others who experienced amazing resilience and recovery in face of trauma and adversity.

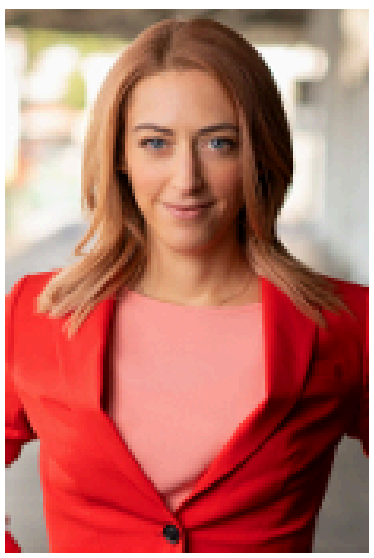
- We can all do our part to spread *stories of resilience and growth*, e.g. via news reports, artwork, pictures, newsletters, websites and conversations.

- Try *capturing your own story*. If you were a journalist, how would you describe your challenges, the turning point in your struggles, how you expressed your strength, resilience, growth and values, and how you changed/ grew from adversity? What photos, videos or collages would best capture that story? You can keep the materials for private reference or share them.

Conclusion and Other Details in the Book

Stress can be harmful or helpful, depending on how you choose to see it. It's the most harmful if you (i) feel inadequate to handle it, (ii) isolate yourself from others and (iii) feel helpless or burdened by it. However, when you embrace it as a natural human resource, it can be a source of confidence, courage, connection, and meaning. The book comes with a wide range of empirical research, studies and interventions to elaborate on the concepts outlined in this summary. For more details, please visit http://kellymcgonigal.com/books.

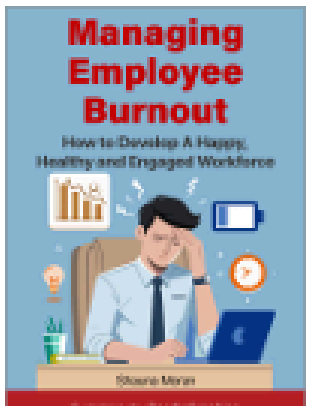
About the Author



Kelly McGonigal, Ph.D., is a health psychologist and lecturer at Stanford University. She's best known for her work in the area of "science help", which combines insights from psychology, neuroscience, medicine, and biology to provide strategies that support health and well-being. She's the former editor in chief of the International Journal of Yoga Therapy, as well as the author of several books on health and wellness.

KEY QUOTES

"The best way to manage stress isn't to reduce or avoid it, but rather to rethink and even embrace it."



MANAGING EMPLOYEE BURNOUT

How to Develop A Happy, Healthy and Engaged Workforce

Shauna Moran

The Big "So What"

In today's fast-paced world, burnout is becoming increasingly common. This book provides practical, evidence-based strategies to address burnout in the modern workplace. It helps you to prevent personal burnout, and create a supportive work environment that boosts productivity, lowers turnover, and improves employee engagement.

Introduction: What is Burnout?

Definition: According to the World Health Organization (WHO), burnout is a syndrome that occurs when chronic workplace stress is not managed effectively.

- Unlike normal fatigue, burnout causes *persistent exhaustion* that doesn't go away even with breaks or vacations. It often leads to detachment from work and negative thoughts about work.

Burnout is a common challenge at work. A 2021 Deloitte survey found that 77% of workers have experienced burnout at their current jobs.

- The COVID-19 pandemic worsened burnout due to the sudden shift to remote work, lack of personal outlets, and increased stress and loneliness. *Remote workers are more susceptible to burnout* because they:

  (i) Struggle to disconnect from work;

  (ii) Often lack healthy boundaries; and

KEY QUOTES

"To truly reduce burnout in our teams once and for all, we need to be willing to be uncomfortable and take ownership as an organization and as leaders."

"True diversity in our workplaces and our teams means that we understand different needs, environments and situations."

"This book, the stories and research I share, will help you understand the different types of burnout that we experience in our working worlds and how the root causes of burnout can themselves have various root causes."

(iii) Feel more isolated due to a lack of face-to-face interactions and social activities.

- Burnout has significant *financial and emotional costs*. A Harvard Business Review article estimates that employee burnout leads to annual healthcare costs of $125-$190 billion in the U.S. and 120,000 stress-related deaths. Burnout affects the whole organization, leading to higher employee turnover, reduced productivity, and increased healthcare costs.

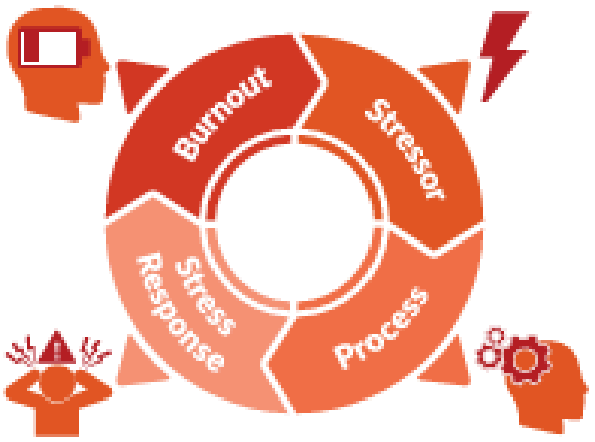
While burnout is experienced by individuals, it is actually a systemic problem that requires a multilayered solution. This summary explores:

- The causes and stages of burnout; and
- Strategies to address burnout at the individual, leadership, and organizational levels.

Understanding Burnout

The stress cycle explains how we cope with stress, and how burnout develops in high-stress environments.

- *Stress is triggered by stressors*, which make us feel like we're missing something essential for survival, physically or emotionally. Some common workplace stressors include critical emails from clients or negative performance reviews.



- *The brain processes the stressors* to decide if they are threats. We interpret and respond to events differently, based on our personal experiences and psychological makeup.
- If a stressor is perceived as a threat, the body initiates a *stress response*, with the fight-or-flight reaction at the core. The fight-or-flight response is controlled by the sympathetic nervous system. It leads to increased heart rate, dilated pupils, and heightened senses, preparing us to confront or escape the perceived threats.

KEY QUOTES

"Now more than ever, it's vital for organizations to look at the impact burnout has on their leaders and to paint the full picture of the true cost of burnout."

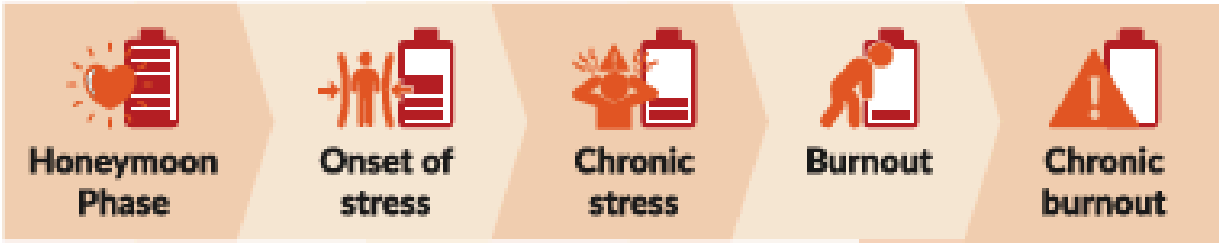
"Burnout rarely has just one cause. It's often a combination of many issues stemming from a lack of ownership of oneself, ineffective team processes and cultures, or even a lack of leadership."

"Everyone interprets life differently, through a lens of their perceptions created by their reality. Therefore, we're all going to have different 'threats' or 'triggers'."

- Prolonged activation of the fight-or-flight response can lead to *burnout*.

- You can *break the cycle* above by activating the parasympathetic nervous system, which promotes rest, relaxation and recovery to mitigate stress. This can be achieved through deep breathing, walking in nature, meditating, a loving hug, etc.

There are many opportunities to stop the stress cycle since burnout doesn't happen overnight. It develops gradually over 5 stages:



- *Honeymoon phase*: You start off on a new job/task feeling energetic, productive, and motivated. You might volunteer for extra tasks but risk overworking and neglecting self-care.

- *Onset of stress*: Stress begins to build up, and cracks appear. You start to skip meals, work late, and have less time for personal activities. You might experience headaches, difficulty focusing, and some anxiety.

- *Chronic stress*: Stress symptoms worsen, leading to a decline in job performance and cognitive abilities. You feel guilt or shame, and get stuck in a cycle of procrastination and overworking. You miss deadlines and feel overwhelmed even by routine tasks.

- *Burnout* sets in if stress is not managed. Productivity drops, and you may dread work and fall sick easily. You are likely to feel strong emotional physical responses like hopelessness, despair, headaches, digestive problems, and sleep issues.

- *Habitual burnout*: You feel totally burnt out, and are constantly disengaged, fatigued, and resigned in all aspects of your life.

KEY QUOTES

"You are the gatekeeper for your wellbeing and mental health."

"Life is too short to be unhappy in a career that's killing your soul. Your potential, strengths and abilities are too precious to not be nurtured fully in the ways you need them to."

Addressing Burnout as an Individual

Know the Signs of Burnout and Strategies for Recovery

Before we can address burnout, we must first recognize its signs.

- *Burnout can manifest as*:

  (i) Sudden dislike for work you previously enjoyed;

  (ii) Lower engagement and productivity; and/or

  (iii) Persistent negative thoughts about work and colleagues.

- *Ask these questions*:

  (i) Have you become more cynical, disconnected, or resentful towards your job? Do you feel more irritable or impatient towards colleagues or customers?

  (ii) Are you overreacting emotionally to work situations that you used to handle calmly?

  (iii) Do you struggle to switch off from work? Do you feel too tired to be productive?

  (iv) Are you experiencing unexplained physical issues like headaches, stomach problems, or changes in sleep patterns?

  (v) Are you using food, drugs, or alcohol to cope with job stress?

Burnout recovery varies among individuals, and can take months or years. Some strategies for recovery include:

- *Becoming aware* of your stress triggers and levels, so you can manage your responses deliberately.
- *Getting emotional support* from friends, family, and colleagues.
- *Making healthy lifestyle adjustments* like sleep, diet, exercise, and engaging in joyful or fulfilling activities.

KEY QUOTES

"To build self-awareness, we must strengthen our conscious connection to all three brain regions: our thoughts, emotions, and gut instincts."

"It's not about how much time you have, but rather how you can bring awareness to spend some time on yourself before you spend time with the outside world."

- *Setting clear boundaries* during recovery, e.g. saying no to social invitations or extra responsibilities to protect your energy and focus.

Build Self-Awareness and Emotional Intelligence

Studies show that employees with emotional intelligence (EI) perform better at work and are less likely to experience burnout. Self awareness and EI are especially crucial for remote workers, who must manage their own schedules and environments, and cope with team dynamics in a virtual setting.

Strengthen your ability to manage your needs, emotions, and interactions with others.

- Throughout the day, regularly *assess your physical-emotional state*, identify what you need to feel at your best, and adjust your plans and activities accordingly.
- Equip yourself with *strategies for managing negative emotions*.
  - (i) Pick 3 key emotions (e.g. anger, fear, sadness) and brain-storm 5 ways to manage each.
  - (ii) You can shift your mood by changing your posture (e.g. smile, relax your posture, or roll your shoulders), do deep breathing or take short breaks.
- *Get feedback* from trusted colleagues on how your emotions affect them. Use these insights to adjust your emotional responses and improve interactions.

Improve Your Remote Work Practices

One of the key advantage of remote work is its flexibility. Use that to design your schedule based on when/how you work best.

- Organizations should let people plan their work according to their *needs and body rhythms*, instead of insisting on standard 9-5 hours. For example, a working mom might prefer to spend the mornings with her children and work later in the day. People also have different peak productivity times.

KEY QUOTES

"Remote working is not for everyone, and it takes a particular skill set and abilities to work independently at home."

"By being aware of your feelings, you have the power to change your emotional reactions to situations."

"The more strategies you have at your disposal, the more emotionally agile you will become."

"How might the employees' experience in your organization change if all your people had more autonomy to create their own schedules?"

Prioritize your tasks by urgency and importance. Then, focus on the most important tasks that contribute the most to your goals.

Set aside time for deep work. Cal Newport describes deep work as focusing 100% on a complex task, without distractions. This enables you to learn faster and produce better results. By contrast, shallow work, involves tasks that don't need much concentration, such as responding to emails.

- *Individual level*: If you're more focused and energetic in the mornings, then dedicate mornings for deep work and schedule meetings later in the day.
- *Team level*: Dedicate time for team brainstorming, problem-solving, and planning.

Incorporate wellness into your routine.

- Research shows that productivity drops significantly after 50 hours of work per week. Take *frequent, high-quality breaks* to improve productivity and prevent burnout. Make sure you include activities that refresh and de-stress you.

Establish healthy boundaries to improve productivity and to switch off from work without guilt.

- Wellness is different for everyone, so *identify the boundaries* that you need. These could include physical boundaries (e.g. a designated workspace), or mental-emotional boundaries (e.g. setting pre-determined work hours and having uninterrupted time for focused work).
- *Communicate and enforce these boundaries* with colleagues. Create a safe space where team members can discuss boundary concerns openly.

Establish a routine for the start and end of each workday.

- Create a *start-up routine* to energize yourself before work, e.g. meditate, exercise for 5 minutes, or enjoy a cup of coffee.
- Establish a *wind-down routine* to relax and switch off from work, e.g. faking a commute, writing down your end-of-the-day thoughts, or watching your favorite program.

KEY QUOTES

"How you manage and prioritize your tasks can be the difference between feeling overwhelmed...and being effective at getting your work done."

"There's a difference between working remotely and being genuinely effective at remote working."

"The key to successful remote working in any team and for any individual is understanding how to leverage the flexibility of remote working."

"If nobody considers the fundamental right to disconnect from work, nobody has the opportunity to disconnect."

"Defining and setting your boundaries provides you with a set of rules to operate by and tells others how you'd like to be treated."

- *Reflect on your work habits and routine* to keep refining them. Consider what went well, what didn't go well, and what you should do differently. Keep what works, and adjust what doesn't.

Addressing Burnout as an Organization

Burnout is a systemic issue that requires organizational changes and support. It cannot be resolved at an individual or talent management level alone.

- To understand the full impact of burnout, companies should *measure its effects* on absenteeism, stress-leave, turnover rates, and productivity issues.

Address Key Reasons for Burnout

A Gallup survey identified 5 key reasons for burnout at work.

Unfair treatment: Discrimination, harassment, and bullying contribute to burnout. Employees are 2.3x more likely to experience burnout if they feel unfairly treated at work.

- Establish clear policies against *unfair treatment* such as offensive comments, unfair demotions, or gender bias. Use FAQs and examples to ensure employees understand these policies and the support available.

- Address *proximity bias*, which occurs when employees in the office are seen as more effective/committed than remote workers. Educate leaders and encourage them to work remotely to understand team members' work conditions. Ensure remote workers receive the same information and perks as in-office employees.

Excessive workload leads to poorer performance, decreased confidence, and more stress.

- *Distribute work fairly* and set limits on temporary surges in work.

- *Focus on output* or results, not input or time spent working.

KEY QUOTES

"The actions of organizations have a greater impact on the reduction and prevention of burnout than any one individual can make on their own."

"The true cost of burnout should be presented in ways that speak both to the heart and the head."

"Consider a high-performing culture that promotes and only recognizes achievement and results."

- Create a *safe environment* where employees can discuss workloads without fear of negative consequences.

Role ambiguity: Without clear roles and responsibilities, employees can feel confused, stressed, and overworked.

- Do a *comprehensive onboarding* for new hires, with a complete digital guide and resources. Set clear expectations, including: their responsibilities, what success in the first 30 days looks like, and how they contribute to company goals.
- Facilitate virtual introductions with other team members, and pair new hires with experienced employees for a few months.
- Hold regular *1-1 meetings* to clarify roles/expectations in face of changes in the work environment.

Lack of managerial support: When leaders are overloaded, they can't effectively support or connect with their team members.

- Limit the *number of direct reports* to a manageable number (ideally less than 7).
- *Reduce non-essential tasks* to free up leaders' time for coaching and supporting their teams.
- *Train leaders on critical skills* like emotional intelligence, active listening, and coaching.

Too many unrealistic deadlines can create a snowball effect, where a delay on 1 project affects all other projects.

- Set *achievable goals and timelines* together with employees. Consider if other tasks should be re-prioritized or delegated.

Develop a Healthy Work Culture

Remote work is becoming increasingly prevalent. To attract and retain top talent, you need a healthy work culture.

- Many *employees prefer remote work* for flexibility and global opportunities. A Flexjobs survey found that 65% of employees prefer remote work, and 58% would look for new jobs if they're required to return to the office.

KEY QUOTES

"It is ambiguity that leads to confusion, self-doubt and overworking in remote teams."

"Employee burnout is preventable, not inevitable, because burnout isn't a personal failing, it's often a sign that an employee isn't receiving adequate support."

"If everything is urgent, then nothing is urgent."

"In a candidate-driven market, having a good reputation as an employer has become key to attracting great new employees."

- Remote work also *gives companies access to a broader talent pool*. However, to attract and retain top talent, you need a strong culture and reputation, and to hire and manage remote workers effectively. High stress and burnout can lead to high turnover and loss of talent.

Hire remote workers with emotional intelligence (EQ) and self-management skills, then equip them with the skills and space to succeed.

- Remote workers need *self-awareness and self-management skills* to manage their schedules and interactions effectively. Look for EQ, adaptability, and independence during your hiring process. Ask questions like: "Describe a situation where you admitted to being wrong and how you handled it" or "How do you maintain relationships remotely?"

To build a healthy work environment:

- Develop a *purpose-driven work culture*:

  (i) Help employees understand the purpose behind their work, to improve engagement and reduce the risks that they will burnout or quit.

  (ii) Involve employees in CSR activities aligned with their values and the organization's mission.

- Balance between *excellence and employee wellbeing*:

  (i) Respect employees' right to disconnect, and encourage them to take breaks and vacations after periods of intense work.

  (ii) Implement policies like meeting-free days or communication-free afternoons.

- *Create flexible work arrangements*: Allow employees to choose their work hours and location. Consider a 4-day workweek, which has been found to reduce stress and improve work-life balance.

- Adopt a *growth mindset*: Continuously improve company culture by collecting employee feedback and addressing unmet needs to keep them happy and healthy.

KEY QUOTES

"Your culture will eat any strategy for breakfast"
—Peter Drucker

"All the boundary building in the world won't help your team members all that much if your organization doesn't have a culture and policies that support their efforts."

"The pay cheque is essential, but the purpose is critical."

"Often, it's not about what organizations do but how they do it....Ebbs and flows are a natural cycle on this planet...so why do some organizations expect their teams to perform at 100 per cent all day, every day?"

"Changing culture requires changing mindset."

Optimize Processes for Remote Teams

Remote workers are often so busy with back-to-back meetings, messages, and "Zoom fatigue" that they have no time/energy for creative work or "me-time". Adopt remote-first processes:

- Design processes (e.g. project management, communication, and performance evaluation processes) for remote teams, then adapt them for in-office settings.

Clear communication is essential for trust and engagement, especially for distributed teams.

- *Synchronous communication* occurs in real time, such as video calls or face-to-face meetings.

  (i) Hold such meetings only if necessary. Set clear objectives and expected outcomes for each meeting, keep them short, and include only essential participants.

  (ii) Start and end meetings on time, and avoid scheduling meetings back-to-back.

- *Asynchronous communication* involves delayed responses, such as email or instant messaging tools. This allows for more thoughtful responses, and it's generally more viable for distributed teams with members from different time zones.

  (i) Set clear communication guidelines for the use of Slack, email, or other tools. Generally, it's better to over-communicate by providing all details upfront—including task urgency, expected response times, required actions, and relevant materials—so no clarifications will be required.

  (ii) Be mindful of tone, time zones, and off-hours. Team members should use "Do Not Disturb" statuses as needed.

  (iii) For complex discussions, consider a short call/meeting, then record and share the details to avoid information being lost in message chains.

- *Tailor your mix* of synchronous and asynchronous communication to suit your team's needs.

  (i) Co-create shared practices with team members for ownership and sustainability.

KEY QUOTES

"The difference between companies that succeed at their remote team processes and those that don't lies in their openness and ability to create new processes based around how a remote team operates remote-first processes."

"Meetings are fundamental to the success of remote teams, but they need to be of high quality."

"The autonomy that comes with working remotely and primarily alone means we should be tapped into ourselves as individuals to make better decisions that promote our overall wellbeing."

(ii) Where possible, choose flexible (async) communication over real-time meetings, and written communication over verbal ones.

(iii) Regularly consider what you should start, stop, or continue doing as a team.

Addressing Burnout as a Leader

Leadership impacts 70% of employee engagement. It's crucial to equip leaders with the right skills and resources to manage people effectively.

Build Trust and Psychological Safety

Leaders must know the differences in managing remote teams and office-based teams.

- An office setting offers lots of *opportunities for casual interactions*, like a spontaneous chat with a colleague in the office pantry. These help to build personal connections between team members beyond their work roles. Such opportunities are missing in a remote setting, so leaders should intentionally create virtual coffee chats or other bonding opportunities.

- It's easier for leaders to notice signs of stress and burnout in the office, where they can observe team members' *mood shifts and body language*.

  (i) In remote settings, use video calls to observe non-verbal cues like posture, eye bags, or fidgeting—which are potential signs of stress or overwhelm.

  (ii) Ask about their wellbeing if you notice any red flags. Don't wait for the "right time" to raise issues.

Build psychological safety: Create an environment where people feel safe to discuss challenges and share opinions openly.

KEY QUOTES

"We can better build empathy towards our colleagues by finding common ground and interests outside of just working together as a team."

"As a remote leader, you must...go the extra mile in terms of proactive communication and acknowledgement."

"Trust is an aspect of leadership that we often overlook. We can't quantify it, but it accelerates growth in all that we do, both in business and in our personal lives."

- *Engage everyone*: During meetings, invite each person to speak through voice or chat. Quieter members can share their thoughts through images or GIFs.

- *Listen actively*: Give your full attention during discussions. Turn off notifications and close other tabs.

- *Invite participation* by asking open-ended questions like, "What questions do you have right now?" instead of close-ended questions like "Do you have any questions?" Pause to give time for responses.

- *Discuss expectations openly* to build trust, understanding, and cooperation. Define working methods, problem-solving strategies, success metrics or outcomes. Accommodate different communication preferences, e.g. some people prefer to text, while others prefer a brief chat before discussing work.

- *Hold regular 1-1 meetings* to support/coach team members on task prioritization and performance management, and to create a safe space to address misunderstandings or conflicts. Aim for at least 45-minute sessions every 2 weeks.

KEY QUOTES

"We...want to hold space and to create safety for the people we work with to speak up when they need to."

Provide Emotional Support for Team Members

Leaders can **reduce emotional exhaustion** by providing clear roles, predictable work conditions, and meaningful tasks.

- *Role clarity*: Ensure team members know what to do, especially during times of change. People are less prone to burnout when they're clear on their responsibilities.

- *Predictability*: Guide team members through changes.

  (i) Use 1-1 conversations to explain why changes are necessary and beneficial, and to address questions or concerns. Keep the communication lines open with regular updates and discussions.

  (ii) Share personal experiences to build trust and encourage open discussion.

- *Meaningful work*: Employees are more engaged and less likely to burnout when they know that their work matters.

"A problem shared is indeed a problem halved. If we can reduce the outcast beliefs that we hold about ourselves when we're going through a challenging time as a professional, we have started to solve the problem."

(i) Clearly define tasks, outcomes, and their significance.

(ii) Set realistic deadlines, and re-prioritize existing tasks if required. Agree on how to communicate progress and address problems. Clarify how much autonomy each person has to make decisions.

(iii) Create a team culture of recognition. Regularly celebrate efforts and achievements via praises, notes, or shout-outs.

Organizations should provide support, systems, resources, and recognition, to help leaders perform such emotional-support roles more more effectively.

- Leaders can also *build support networks* by developing connections between team members, or nurturing new relationships to enhance collaboration.

Guide Teams Through Effective Coaching

Coaching helps team members to identify professional issues and solve problems. Effective coaching begins with leaders' understanding of themselves, including their own perceptions, beliefs, and biases.

- Use personality assessments to help leaders deepen their *self-awareness*. Then, encourage leaders to set specific goals for leadership development based on their personality test results.

Here are several tips for effective coaching:

- Don't fix team members' problems for them. *Empower problem-solving* by helping them to reflect on the problem, explore options, and arrive at their own solutions.

- When a team member approaches you with a problem, *seek permission* to coach them. For example, say, "I'd like to try some coaching with you to explore possible solutions. Are you open to that?"

- *Engage fully*: Set up a video call with cameras on, and listen fully for both verbal and non-verbal cues.

- Use *questions* to guide your team member:

KEY QUOTES

"If organizations fail to support their leaders in emotional labour it can lead to stress, depersonalization and other emotional outcomes like lower job satisfaction."

"What's...important is that companies...offer leaders the support that they need when dealing with more emotionally exhausting issues and help them be recognized for this type of work, rather than just the output of their work."

"Too often, leaders are trying to support and coach their team members to help them reach their full potential without necessarily doing that for themselves first."

"Instead of providing fixes, coaching helps individuals reflect on their own ideas and solutions and reality-test them out loud in a supportive environment."

"As a leader, you'll want to actively listen to what's being said, and what's been communicated through the unspoken–body language, eye contact, facial expressions and posture."

(i) Clarify the problem by asking questions like, "What specific tasks or factors are making you feel this way?" Guide them to identify the root causes, by thinking back on when/why the problem first started.

(ii) Encourage ownership: After identifying the problem, ask them to suggest the next steps. For instance, "Based on our discussion, what do you think is the most important next step and why?"

(iii) End the session by inviting them to summarize the discussion and action steps. Discuss any support they might need, and set a follow-up date to check on their progress.

Role-Model Healthy Behaviors

Leaders' actions set the standard for team members. One of the best ways to address burnout is for leaders to role-model the healthy behaviors they want to see in their team.

- Don't forget to *address your wellbeing as a leader*. Ask yourself: How do I recognize burnout symptoms in myself? What actions can I take to address such symptoms? What support is available to me? How can I set a positive example for wellbeing at work?

Here are several ways to role-model healthy practices:

- Taking *regular breaks* throughout the workday, and *disconnect fully* from work during off-hours. Log off from all work technology to show it's ok to be unreachable.
- Share wellbeing *practices and habits* that you find useful while working remotely.
- Offer glimpses into your life and *values outside of work*.
- Don't be afraid to take breaks or vacations. Demonstrate how to handover important projects and meetings in advance, and prepare team members to handle the work in your absence.

KEY QUOTES

"As a coaching leader, it's your responsibility to be open to all possibilities in terms of root cases and to rule nothing out."

"To lead by example means to guide others through your behavior instead of your words."

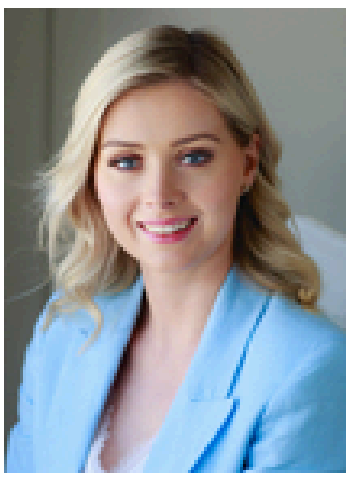
"To create a healthy team, you need to feel healthy yourself."

"Leaders can't pour from an empty cup–meaning if they are trying to support their team without supporting themselves, they risk burnout."

Other Details in the Book to Look out For

Remember: organizations flourish when employees thrive. This book includes many examples, case studies, detailed tips and best practices for managing burnout, especially for remote workers. It covers details for various interventions at individual, organizational, and leadership levels. For more details, please visit www.shaunamoran.com.

About the Author



Shauna Moran is an author and leadership coach who specializes in preventing burnout and improving organizational health. She founded Operate Remote, a consultancy firm that develops remote and hybrid work strategies for companies. Focusing on team performance and employee well-being, Shauna offers practical insights for leaders to foster supportive work environments.

About ReadinGraphics

READINGRAPHICS
Ideas Come Alive

ReadinGraphics captures pearls of wisdom from the best books around the world, chunks down concepts into simple, actionable steps, and presents them in graphics that you can absorb at a glance.

We cut through the clutter to bring ideas to life, making it easier to see, organize and apply insights to create breakthroughs.

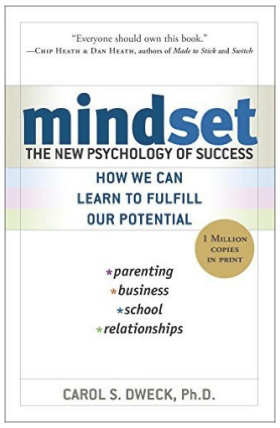
KEY QUOTES

"Never underestimate the power of making small incremental changes for yourself, your team or your wider organization towards the prevention and management of burnout."



MINDSET

The New Psychology of Success

CAROL S. DWECK, PH.D

The Big "So What"

Your mindset—how you see yourself—shapes how you respond to people and events, to affect your outcomes. In this book, Dweck draws on 20 years of research to explain how you can recognize, understand and change a fundamental mindset to impact all aspects of your life.

Growth vs Fixed Mindset

The Power of Mindsets

Why do some people fall apart in face of setbacks, while others turn their failures into success? Why are some people obsessed about proving themselves, while others can laugh at and learn from their mistakes? The key difference is in their mindset.

Dweck found that there's a fundamental difference in mindset—**growth vs fixed mindset**—that explains many success factors, such as resilience, self-belief, and the willingness to take risks and strive for excellence.

- The *fixed mindset* is the belief that your qualities *cannot* be changed. Since you believe these qualities are a permanent part of who you are, you feel the need to constantly prove yourself.

- The *growth mindset* is the belief that your qualities *can* be changed and nurtured through effort. You believe that people may be born with different gifts, interests, or

KEY QUOTES

"Changing people's beliefs—even the simplest beliefs—can have profound effects."

"The passion for stretching yourself and sticking to it, even (or especially) when it's not going well, is the hallmark of the growth mindset."

temperaments, but everyone can change and grow through experience and practice.

Indeed, **mindsets aren't permanent and can be changed,** i.e. you can choose what you believe. You're likely to have a *mix of both mindsets*, but skew toward one of them. You also don't have the same mindset *all* the time. For example, you may have a fixed mindset toward your personality but a growth mindset toward your abilities.

Mindset → Definition & Approach to Success

Learning vs Validation:

- People with a fixed mindset define success as being perfect, mistake-free, smart or right. The focus is on *validating* themselves. However, those with a growth mindset believe they are successful so long as they're improving. This frees them to focus on *growth*.
- As babies, we weren't afraid to fail or make mistakes. However, as we grow older, we start to worry about *how others think of us*; we want to appear smart and successful, and avoid situations where we look bad. Returning to a growth mindset means refocusing on stretching ourselves to become smarter and better, rather than just appearing to be so.

Stretching vs Certainty:

- People with growth mindsets thrive when they *embrace challenges*. They seek to *learn from others* who are better than them or can push/help them to grow. They love experiences that stretch them, and are driven by a desire to push their boundaries—so much so that they sometimes achieve the impossible.

- On the other hand, people with a fixed mindset thrive when they are in their *comfort zone*, and feel certain of their success. They're interested only when they see results, and lose interest when things don't work out predictably. Hence, they tend to surround themselves with people who make them feel/look good, and prefer tried-and-tested activities that validate what they're confident or good at.

KEY QUOTES

"Mindsets are just beliefs. They're powerful beliefs, but they're just something in your mind, and you can change your mind."

"It's not about immediate perfection. It's about learning something over time: confronting a challenge and making progress."

"If you're somebody when you're successful, what are you when you're unsuccessful?"

"People in a growth mindset don't just seek challenge, they thrive on it. The bigger the challenge, the more they stretch."

Ability vs Learning. Your potential depends on your ability to develop new skills, and cannot be measured by a test.

- Unfortunately, people with fixed mindsets allow themselves to be limited by *test scores and evaluations* that supposedly tell them what they can achieve. Or, they may use tests and success symbols to prove that they are special.

- Those with growth mindsets know that they're only limited by their *willingness and ability to learn*. They constantly seek out opportunities to grow and stretch themselves. That's why many ordinary or even underperforming kids can grow up to become outstanding artists, sportspeople or scientists.

Identifying & developing potential. There's nothing wrong with having self-confidence and belief. The danger comes when you feel you're entitled to success because you're special, or when you define your self-worth by your achievements. When you do so, you'll start to fear losing this sense of specialness.

- Marina Semyonova (a renowned Russian dancer and teacher) identified potential and selected her students by observing how they handled feedback during their trial period.

- NASA prefers candidates who have bounced back from massive failure, over those who have a track record of only successes.

Those with a growth mindset generally have a **more accurate self-assessment** of their strengths and limitations. Since they believe they can improve in any area, they focus less on inflating their abilities to feed their ego. Instead, they more *objectively assess* their current abilities so they can identify exactly what/how to improve.

Mindset → Definition & Approach to Failure

When things go wrong, everyone feels bad to some degree. The difference is in how we respond.

- People with a *fixed mindset* allow the failure to define them permanently ("I'm a failure"). They may blame themselves, throw up their hands and decide there's nothing they can

KEY QUOTES

"An assessment at one point in time has little value for understanding someone's ability, let alone their potential to succeed in the future."

"The fixed mindset does not allow people the luxury of becoming. They have to already be."

"There (are) two meanings to ability, not one: a fixed ability that needs to be proven, and a changeable ability that can be developed through learning."

do. Or, they may try to protect their image by hiding their deficiencies, finding blame or excuses. Since they believe their abilities are fixed and nothing helps, they're more likely to give up or get depressed.

- Those with a *growth mindset* may also feel upset, but they see the mistake as an incident and a problem to be overcome ("I failed this time"). They try to identify their shortfalls, confront the challenges, and seek alternative routes to success.

If you **deny your mistakes**, you can't learn from them. In a study, college students with growth mindsets took reference from (and learned from) other students who did better than them. Students with fixed mindsets tried to make themselves feel better by looking at others who fared worse than them, and/or find excuses.

Negative labels and stereotypes affect everyone, but are especially damaging to people with fixed mindsets.

- Women with *fixed mindsets* (and are aware of the stereotype that "women are bad at math and science") tend to perform worse than their male counterparts. They also tend to drop out of math and science as they feel they don't belong.

- Those with *growth mindsets* tend to be less affected by negative labels and stereotypes, as they see them more objectively and they believe they can overcome any disadvantages.

Mindset → Attitude Toward Effort

Talent vs Effort:

- Many of us *associate effort with inferior ability*. Think of the fable "The Tortoise and the Hare", which teaches us to put in more effort if we lack the natural abilities. If you have a fixed mindset, you may actually be *afraid* to put in effort since (a) you think the need to work harder means you're not "special" enough, and (b) you're silently worried that your best effort may be inadequate.

KEY QUOTES

"When you're given a positive label, you're afraid of losing it, and when you're hit with a negative label, you're afraid of deserving it."

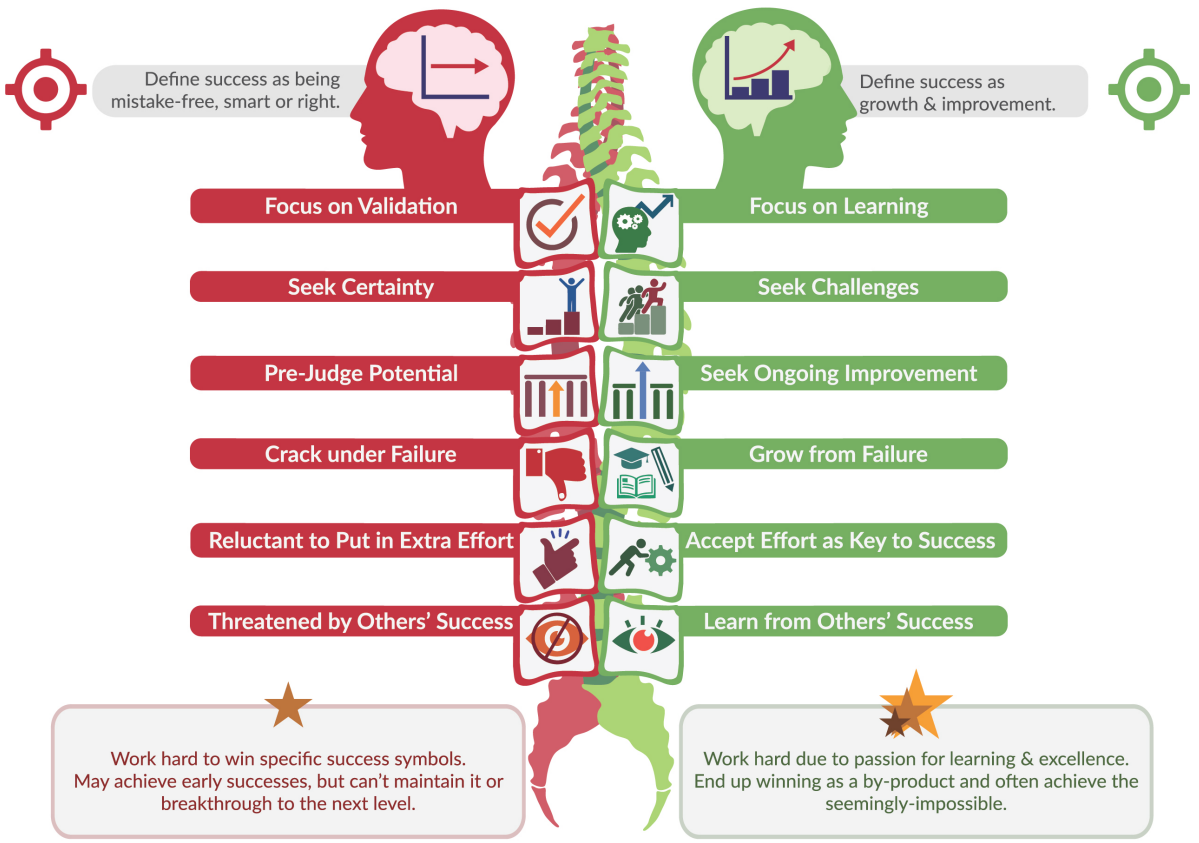
"A growth mindset helps people to see prejudice for what it is—someone else's view of them—and to confront it with their confidence and abilities intact."

"From the point of view of the fixed mindset, effort is only for people with deficiencies."

- *Effort is crucial to success*, regardless of your level of talent. Most "geniuses" accomplish what they do through years of hard work, e.g. Mozart produced his first famous pieces only after 10 years of practice and composition. Inventions are not a flash of brilliance, but the result of a series of discoveries that make a breakthrough possible.

There's nothing wrong with the **desire to win**; the issue is whether winning is a means or an ends. People with a fixed mindset tend to put in hard work only to achieve a specific outcome (e.g. to win an award or get to a certain position). People with a growth mindset are driven by their passion for excellence, and end up winning as a result of their growth.

Here's a recap of the 2 mindsets:



KEY QUOTES

"The lightbulb has become the symbol for that single moment when the brilliant solution strikes, but there was no single moment of invention."

"Many growth-minded people didn't even plan to go to the top. They got there as a result of doing what they love."

Mindset in Parenting and Education

Messages about Success

Parents and teaches often praise children with the good intention of motivating them. However, praises are a double-edged sword—they can build confidence or encourage fixed mindsets.

As a **rule of thumb**, don't praise for abilities or talents; instead, praise for processes (strategies, effort, and choices).

When children are **praised for their abilities** or given positive labels like "talented", "gifted", or "smart", it cultivates a fixed mindset.

- It creates stress to *meet expectations*, and they start to doubt themselves if they don't. They may also get the wrong message that they're loved only because of their talent or intelligence.

- Research found that ability-praised students began to *avoid challenges* that may reveal their flaws, and enjoyed challenges less. After facing setbacks, they performed worse, even when they were given easier problems. In fact, 40% of these students were ashamed of their low scores and lied about them.

A better way is to **praise for effort and approach**.

- Affirm children's *love for learning*, effort, strategies and tenacity in handling challenges. For example, you can say, "That was such a challenging project. I really admire how you stayed focused and tried creative ways to get it done."

- Students who were praised for their effort were motivated to take on new challenges, and *kept learning and improving.* They also enjoyed the challenges more.

KEY QUOTES

"Praising children's intelligence harms their motivation and it harms their performance."

"Telling children they're smart, in the end, made them feel dumber and act dumber, but claim they were smarter."

"Having innate talent is not a goal. Expanding skills and knowledge is."

Messages about Failure

When kids make mistakes, how parents and teachers respond will also shape their mindset and future outcomes.

Avoid giving **negative labels or excuses.**

- Don't *attribute failure to abilities* e.g., "He's so useless" or "She's just not as smart as her brother".

- Don't *protect them from the failure*, e.g. blame circumstances, brush off the mistake as unimportant, or assure them they'll win in the future because they're talented or the best.

It's better to **give constructive feedback** so they know how to learn from the failure and improve. For example, you can say, "I loved the effort you've put in for this test. Now, let's figure out the parts that you didn't understand." Reassure the child before a test/performance that you'll be proud of them for their learning and effort, regardless of the outcome.

Harsh judgement and punishments tend to backfire. The worst message you can send to your kids is that they're only loved if they succeed on your terms.

- Children who were *punished* as babies for crying and fussing tend to become angry with (or even abuse) other children who cry. Those who're punished for disobeying their parents (without explanation) don't learn how to diagnose and solve problems.

- You can *say "No" fairly and respectfully*, by sharing your decision-making process. Even if the child is clearly not putting in effort, you can express your frustration gently, e.g., "I feel disappointed that you're missing this chance to learn. Shall we see how to do this better in the future?"

KEY QUOTES

"Growth-minded parents… set high standards, but they teach the children how to reach them."

"Don't judge. Teach. It's a learning process."

Education, Teaching and Coaching

Mindsets affect teachers and coaches, as well as the students and trainees in their charge.

In **education**, you shouldn't lower standards just to let students score, nor should you raise standards without providing the support for students to reach them.

- *Great teachers* set high standards and teach students how to achieve the results. They take an interest in all their students, rather than pre-judge them and focus only on the achievers. They make a difference because of their love for learning, and their genuine passion to learn together with their students. They use a growth framework and give process-related feedback.

- Marva Collins successfully transformed many "*problematic students*" who were discarded by other schools. She believed in the children, took pride and joy in their learning, and gave

"Teachers with the fixed mindset know which students to give up on before they've even met them."

"The great teachers believe in the growth of the intellect and talent, and they are fascinated with the process of learning."

"Growth-minded teachers tell students the truth and then give them the tools to close the gap."

them a challenging learning schedule and materials. The children rose to the challenge and were motivated to learn.

- Just because a student *seems indifferent* doesn't mean he/she doesn't care. Dweck shares an example of a student who refused to cooperate and even ripped up his assignments. Once the teacher showed that she wasn't judging the student, but was genuinely interested in his learning, he started to make a shift.

Parents and teachers can mould children's mindsets, while **coaches** affect their players' or trainees' mindsets and results. For instance:

- *Fixed-mindset* basketball coach Bobby Knight only cared about his players' results; when they failed, he was harsh and even shamed them publicly. This worked for some players, but caused others to lose their passion for the sport.

- *Growth-mindset* coach John Wooden didn't demand his team to be mistake-free or win all the time. Instead, he gave equal respect to all his players, and pushed them to give their best effort each time.

Mindset in Sports

Natural Abilities vs Growth Mindset

In sports, many people associate natural talent with visible physical attributes, when the true differentiator is in the mind. Dweck presents many examples of sportspeople who made it to the top by using the growth-mindset to overcome disadvantages and short-term failures.

Mohammad Ali didn't have the "natural" physique of a boxer, but he made up for it with speed and mental sharpness. Michael Jordan was rejected in college and the first 2 NBA teams he applied for, and became a basketball legend from hard work and self-improvement. These are examples of the **growth mindset** at work.

KEY QUOTES

"As parents, teachers, and coaches, we are entrusted with people's lives…the growth mindset has a key role to play in helping us fulfill our mission and in helping them fulfill their potential."

"You may be outscored but you will never lose."
- Coach Wooden

"As much as our culture talks about individual effort and self-improvement, deep down…we revere the naturals."

On the other hand, tennis player John McEnroe regularly bragged about being #1, and found excuses when he lost. People like him and Billy Beane were successful earlier in their sporting career, but their **fixed mindset** eventually worked against them.

Character: The Vital Ingredient

Character is essential in sports—it's the ability to dig deep, find your strength and keep going in face of setbacks. It determines if you can make it to the top and stay there. It decides if you crack in face of failure or persevere to make a comeback. Character is built on the growth mindset; Dweck calls it the "mind of a champion".

You can **identify someone's mindset** from what they say. Basketballer Iciss Tillis reveals her fixed mindset when she says, "I just feel like I'd be such a failure…and I'm going to end up like my dad: a nobody." Candace Parker shows her growth-minded thinking when she says, "If you work hard at something, you get out what you put in."

Attitude toward success: Champions like John Wooden, Tiger Woods, and Mia Hamm care about winning, but they focus on pushing themselves to be the best they can be. They see winning as a by-product of being their personal best, unlike others like McEnroe who see winning as a way to affirm their superiority.

Attitude toward failure: Growth-minded athletes treat setbacks as a wake-up call and an opportunity to learn, like how Michael Jordan kept persevering in face of failure. Fixed minded athletes are poor losers—McEnroe was so humiliated from losing a match that he didn't play mixed doubles for 20 years, and Sergio Garcia fired his caddies and blamed others when he performed badly.

Staying at the top: Those with a growth mindset (e.g. Michael Jordan, Tiger Woods) keep working on themselves, thus continue to perform even as they age.

Star mentality vs team-player. All sports are essentially team sports—even swimmers must be supported by a team of trainers, nutritionists etc. Fixed-minded athletes love the spotlight and being superheroes, while growth-minded

KEY QUOTES

"Just because some people can do something with little or no training, it doesn't mean that others can't do it (and sometimes do it even better) with training."

"I've missed more than nine thousand shots. I've lost almost three hundred games. Twenty-six times, I've been trusted to take the game-winning shot, and missed."
- Michael Jordan

"A superstar's talent can win games, but it's teamwork that wins championships."

athletes understand that being a star-player is really about playing their role well.

Mindset in Business and Leadership

Mindset and Business Management

Growth mindsets can help companies to thrive while fixed mindsets lead to their downfall.

Examples in business. Enron's focus on big talents led to an elitist culture, with a fixed mindset and tendency to deny deficiencies, leading to its demise. On the other hand, Jim Collins found that good companies that became great had a common success factor—they had humble, hardworking leaders who focused on improvement rather than the limelight.

Mindsets affect **management decisions.** In a study, participants were split into 2 groups and tasked to run a simulated company. One group was told that their performance was measured by their capacity (fixed mindset), while the other group was told to develop management skills (growth mindset). Both groups couldn't meet their targets initially. However, the growth mindset team could learn from their mistakes and kept improving, while the fixed mindset team was too bogged down by their fixed abilities to learn.

Mindset and Leadership

Fixed mindset in leadership. Leaders with fixed mindsets (e.g. Lee Iacocca, Albert Dunlap) use their companies as a vehicle to validate themselves.

- *Star CEOs* with big egos believe they and their companies are superior. They focus more on their image and on displaying their superiority, than on tackling the tough problems in the company.

- The "*CEO Disease*" can affect leaders at all levels. Due to their desire to be seen as heroes, such leaders focus on short-term strategies that make them look good, surround themselves

KEY QUOTES

"Just about every sport is in some sense a team sport. No one does it alone."

"A company that cannot selfcorrect cannot thrive."

"People who preen their egos and look for the next self-image boost are not the same people who foster long-term corporate health."

"Fixed-mindset leaders… must repeatedly affirm that they are superior, and the company is simply a platform for this."

with worshippers, and lose touch with reality. Fixed-minded leaders also tend to be defensive, controlling, or put others down. As the people around them start to behave the same way, the disease spreads.

Growth mindset in leadership. Growth-minded leaders (e.g. Jack Welch, Lou Gerstner, Ann Mulcahy) focus on growing themselves, their people and their companies.

- They understand the need to address weaknesses for *long term success*, even if that means getting criticized in the short-term.

- For example, *Jack Welch* always made time to meet with his front-line employees. He believed in mentoring, focused on teamwork rather than superstars, selected people with the passion for growth and excellence, and removed "brutal bosses". Although Welch also became overconfident and made mistakes at times, he used these as lessons and wake-up calls.

Growth mindset can be learned:

- *Cultivate a growth mindset* in your organization by: (a) finding *managers* with a growth mindset, (b) *training* people in mindsets and communication/mentoring skills, and (c) creating a *conducive environment* where people can thrive—through constructive feedback, the belief that skills can be learned, seeing managers as learning resources, and knowing the organization values learning and perseverance.

- Dweck's *"Brainology" workshop* helps people to understand how the brain works, how abilities can be developed through coaching and practice, and how they can develop themselves and others.

KEY QUOTES

"Jack Welch was not a perfect person, but he was devoted to growth. This devotion kept his ego in check, kept him connected to reality, and kept him in touch with his humanity."

"The lesson is: Create an organization that prizes the development of ability—and watch the leaders emerge."

Mindset in Relationships

Mindset and Love Relationships

At some point in our lives, all of us are hurt by others. Our mindset determines if we can deal with heartaches and disappointments, or

stay permanently scarred. This is because our mindset determines our beliefs about (a) our qualities, (b) our partner's qualities, and (c) the relationship's qualities.

People with **fixed mindsets in relationships** believe that they, their partners and the relationship cannot change. Thus, they:

- Assume that if they're meant to be together, they'll understand each other and agree on everything. When things go wrong, they get disillusioned that things *will never improve;*
- *Give themselves labels* like "unloveable", "unworthy". When things go wrong, they feel judged or rejected, lash out or blame themselves/their partners, rather than seek understanding and solutions; and
- Tend to *compare and compete* with their partners to see who's smarter, more popular etc.

People with **growth mindsets in relationships** believe that they, their partners and the relationship can change. Thus, they:

- Focus on the issues, choose growth and understanding, and *learn from bad experiences*, so they can improve the relationship; and
- Understand the importance of *putting in effort*, learning to communicate and work through differences.

Mindset and Other Relationships

Friendship. People with fixed mindsets may unintentionally use their friends for validation and to offload their issues. They areusually ready to offer advice for their friends' problems, but are less interested if their friends are doing well. If others don't feel good or validated around you, problems will emerge in the relationship.

Shyness can be found in people with fixed or growth mindsets. However, studies found that those with fixed mindsets tend to remain socially-impaired, while those with growth mindset

KEY QUOTES

"Mind reading instead of communicating inevitably backfires."

"There are no problem-free candidates. The trick is to acknowledge each other's limitations, and build from there."

"Ego-wise, it's easy to be sympathetic to someone in need. It's your assets and your successes that are problems for people who derive their self-esteem from being superior."

"The belief that partners have the potential for change should not be confused with the belief that the partner will change."

are more likely to overcome their shyness by learning new social skills.

Social-emotional skills can be learned. Most relationship issues stem from communication problems rather than character flaws. For things to change, there must be *motivation and commitment* to take concrete actions. This starts with a willingness to focus on what the other party wants, so they feel you're trying to help them to reach their goals (rather than change them into what *you* want).

Changing Mindsets

In the book, Dweck shares many stories to show that mindsets can be learned and changed. However, the key message is not that fixed mindsets are bad and growth mindsets are good; it's about creating awareness of the 2 mindsets and their impact, so you can make a **conscious choice**. Having a growth-mindset doesn't mean that you must change everything or seek perfection. It's about accepting where you are—with your imperfections—and removing artificial constraints so you can decide if/what changes to make in your best interest.

Getting Started

If you decide to make the shift, here are some steps and tips that you can use to get started:

Be aware of your mindset(s): Use this questionnaire to identify which mindset you're skewed toward. Do you have a different mindset toward different aspects of your abilities or personal qualities?

Reflect on the impact of fixed vs growth mindsets:

- Think of *people who have growth vs fixed mindsets*. Do they try to grow/challenge themselves, or prove/defend themselves. Why and how do they do that?

- Research on *someone you admire*—you're likely to discover how much work they've put in to achieve what they did.

KEY QUOTES

"The growth mindset is a starting point for change, but people need to decide for themselves where their efforts toward change would be most valuable."

- *Imagine facing a big challenge* where your success/failure is visible to all. How will you feel and act with a fixed mindset vs a growth mindset?

Know that you can choose and change your mindset.

- List down *what you use to judge yourself* (e.g. test results, what people say). Examine them and realize they don't really dictate your outcomes.

- When you're feeling discouraged by a challenge or setback, *take action despite bad feelings*. Focus on what you can learn or do to overcome it. Make a concrete plan, and visualize in vivid detail when, where, and how you'll carry out your plan. Imagine your brain forging new connections as you do so.

- Instead of saying "I can't do that", say "I can't do that yet", and make it happen.

Examine your mindsets in **various aspects of your life**: as a parent, teacher, coach, at the workplace and in your relationships. Consider how you can shift your mindset and nurture growth mindsets in the people around you.

Other Details in the Book to Look out For

The book includes many other anecdotes, examples, and resources such as:

- Examples and studies in schools, sports, and companies;

- Letters from readers on how the book and ideas have helped them;

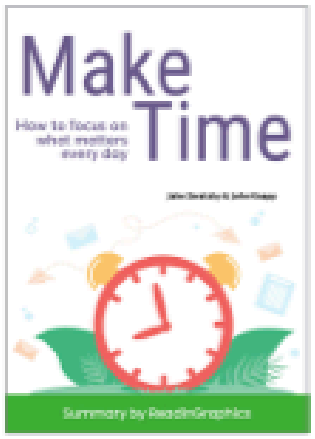
- Tips at the end of each chapter to help you apply or reflect upon the ideas in the book; and

- Detailed scenarios of setbacks that you may encounter, with a walkthrough of the thoughts and emotions you may experience with a fixed mindset, and how to shift to a growth mindset.

For more details and resources, do visit https://mindsetonline.com.

KEY QUOTES

"My work has been about growth, and it has helped foster my own growth. I tis my wish that it will do the same for you."



MAKE TIME

How to Focus on What Matters Every Day

JAKE KNAPP & JOHN ZERATSKY

The Big "So What"

This book is about making time for the things you truly *want* to do. Instead of trying to become more productive or cramming more into your day, change the default way you work and live to truly own your life.

Introduction

People in the 21st century are perpetually busy because of 2 things:

- The "*Busy Bandwagon*" refers to the hectic culture of modern societies. We're expected to respond quickly to everything, from an email to a new project. We keep trying to pack more into our schedule for fear of falling behind.

- Whenever we get a breather, we'll reach automatically for our phones and devices, only to get sucked into "*Infinity Pools*". These refer to apps or platforms with an endless supply of interesting content, e.g. newsfeeds, social media and video games.

- Caught between the Busy Bandwagon and Infinity Pool, we have no time by default. To regain control of your life, you must *reset your default settings*.

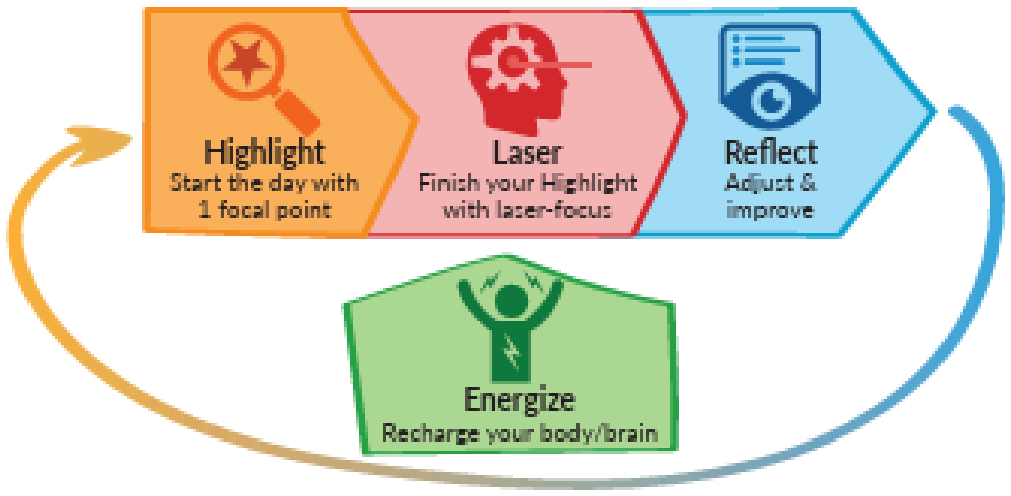
KEY QUOTES

"There is more to life than increasing its speed."
—Mahatma Gandhi

"This is a book about slowing down the crazy rush. It's about making time for things that matter."

The authors (Jake and JZ) are product designers and self-proclaimed geeks who helped to build services like YouTube, Gmail, and Google Hangouts. Realizing how busy and distracted they were, they started to experiment with ways to make time for themselves, and to improve their focus and energy levels. Through their experiments, Jake finally found the time to start writing (something he'd wanted to do since young), while JZ finally started to live his dream of taking long sailing trips with his wife.

- The Make Time formula involves *4 daily steps*: Highlight, Laser, Energize, and Reflect. These were inspired by design sprint principles (an innovation approach invented by Jake), the authors' personal experiments and feedback from readers who tried the approach.



- In the next sections, we'll explain these 4 steps with 87 tactics you can mix-and-match to customize your personal routine. Just choose any of the tactics below, try them out and repeat the process in a *pick-test-repeat* cycle.

  (i) Initially, just try 1 tactic for each of the 4 steps. Then, add new tactics or stick to the ones that work for you.

  (ii) There's no need to be perfect. It's ok to keep changing and refining your system. You may also prefer different tactics for different situations (e.g. when you're in office or traveling).

1) Highlight: Start each day with 1 focal point

Doing more isn't the same as doing what matters. Start by (i) choosing 1 activity to prioritize for the day and (ii) protecting in your calendar.

KEY QUOTES

"Make Time is a framework for choosing what you want to focus on, building the energy to do it, and breaking the default cycle so that you can start being more intentional about the way you live your life."

"Perfection is a distraction—another shiny object taking your attention away from your real priorities."

"Something magic happens when you start the day with one high-priority goal."

Highlights are the bright spots that you look forward to each day. This is an activity, moment or achievement that you can savor when the day is over. It provides a focal point to keep you away from the Busy Bandwagon and the Infinity Pool.

You can choose your Highlight in one of 3 ways.

- *Urgency*: Go for something that's time-critical and must be completed that day. Ideally, the task should be mid-sized and important, e.g. sending a proposal to a customer, or helping your son to finish a school project.

- *Satisfaction*: Choose something you *want* to do, not something you need to do. Ideally, look at projects or activities that are not urgent, because these are the ones you're the most likely to defer indefinitely, e.g. researching your next vacation, or drafting the outline for a novel.

- *Joy*: Go for something you feel like doing that day, e.g. going to the beach, learning a new song on the piano.

Here are some useful points to note:

- *Trust your intuition* and just go with what feels right that day. If it doesn't work out, you can always try something different the next day, or change your highlight mid-day.

- Ideally, pick a Highlight that you can finish in *60-90 minutes*. You can break it down further into several steps.

- *Prioritize your Highlight* over other daily activities.

Tactics for Choosing your Highlights

Write down your Highlight daily, ideally the previous night or the first thing in the morning. You can record it in a notebook, app, or calendar, though the authors recommend using sticky notes placed in prominent spots.

Repeat a previous Highlight. This is especially useful if (i) you didn't get to do or complete a Highlight, (ii) you wish to build a habit or gain momentum, or (iii) you really enjoyed that activity.

KEY QUOTES

"We do not remember days, we remember moments."
—Cesare Pavese

"This isn't about saving time. It's about making time for what matters."

"You only waste time if you're not intentional about how you spend it."

"There's a special, almost magical power to writing down your plans: The things you write down are more likely to happen."

Rank your life priorities and use it as a guide.

- List down *3-10 major priorities* in your life. Go for big categories that can be captured in 1-2 words, e.g. family, music, getting promoted.
- Choose the *1 most important thing*, e.g. something that requires the most work, or something that you care about the most.
- Rank the other priorities and rewrite the list in *order of priority*.
- Circle out the *top priority*. Use this list to guide your daily priorities. You can reshuffle your priorities over time.

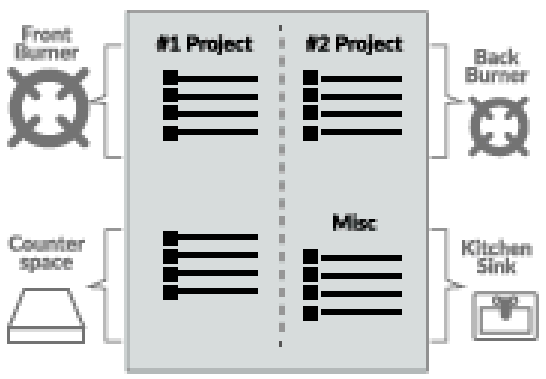
Combine several small, distracting tasks and use batch processing to clear them in 1 Highlight session.

A long to-do list can distract you from what's important and create a nagging sense of incompletion. What's worse, most to-do items reflect others' priorities (not yours). Change your to-do list to a might-do list. Prioritize time for your Highlight, then make an explicit decision on what else to do or ignore.

Alternatively, use a Burner List to focus on 1 big project and 1 small project at a time.

- Draw a line down a blank sheet of paper to create *2 columns*.

(i) The top-left is your "*front-burner*". State your most important project, and break it down into the specific tasks that you must finish in the next few days.



(ii) Leave some "*counter space*" on the bottom-left, where you can add more tasks for your #1 project later.

(iii) On the top-right is your "*back-burner*", where you'll list your 2nd most important project and its related tasks.

(iv) The bottom-right is your "*kitchen sink*" where you place all other items not associated with the 2 projects.

KEY QUOTES

"Most to-dos are just reactions to other people's priorities, not yours."

- When you're cooking, you'll focus on the front burner while occasionally tending to the back-burner. Using the same approach, you can *clear a Burner list every few days*.

You build momentum when you work on something for a few consecutive days. Run a personal sprint by breaking down a project into tasks scheduled over a few days in a row.

Tactics to Make Time for your Highlights

Decide how much time to spend on your Highlight, when to do it, and schedule it in your calendar.

Don't squeeze your Highlights into leftover pockets of time. Instead, block your calendar in advance. If others try to book you during these periods, politely decline and tell them that you already have plans. Start with 1-2 hours a day and adjust from there.

If your calendar is already packed, bulldoze your way by shortening or rescheduling other events to free up blocks of time.

If necessary, cancel/postpone low-priority commitments (e.g. cancel a meeting, delay a deadline or bail on a friend) to make time for your Highlights. Bear with the short-term pain until you regain some control over your schedule.

Say "no" to low-priority requests so you don't have to bulldoze or cancel later. Decline politely and honestly, e.g. "Sorry, I'm working on a couple of major projects and really don't have the time now."

Plan your entire day upfront, instead of reacting to ad-hoc requests by the hour. You can always adjust your plan as things evolve.

Mornings can be one of the best times for your Highlights. To become more effective in the mornings:

- Start your day with bright *lights, coffee and a purpose*. Turn on all the lights in your house, or use simulated lights to help your brain register that it's daytime (especially if you wake up pre-dawn).

KEY QUOTES

"Reacting to what's in front of you is always easier than doing what you intend."

"It's better to ruffle a few feathers than to always push your priorities off for "someday.""

"A structured day creates freedom."

- Plan for *adequate sleep* the previous night. Avoid alcohol or caffeine after dinner, and gradually wind down in the evenings.

If you're more of a night-owl, it could be more productive to do your Highlights at night. Take a break before you begin, set a timer (and switch into "Highlight mode" once it goes off), and give yourself some time to wind down before you sleep.

Don't try to cram as much as possible into your day. When you're exhausted, your work quality dips and the effects can spill over to the next day. Experiment to find your ideal cut-off time to stop work, or end your work day once you've completed your Highlight.

2) Laser: Remove distractions and be laser-focused

This step is about blocking out distractions so you can work with laser-sharp focus for extended periods of time.

You'll naturally get in the zone when you (i) are doing something meaningful that you care about, (ii) have enough energy to focus, and (iii) can keep distractions at bay. That's why all 4 components in the Make Time formula are crucial.

- One of the best ways to remove distractions is to make it *hard or inconvenient* to access them in the first place.

Tactics to Regain Control over your Phone

Make your phone distraction-free. Both the authors did this since 2012, and found themselves feeling happier, calmer and more focused.

- *Delete all distracting apps* including: (i) social apps (e.g. Facebook, Instagram, Twitter), (ii) other Infinity Pools (anything with infinite content, e.g. news, videos, games), (iii) web browser, and (iv) emails (you can still respond to emails on your laptops without constantly looking at them on your phone).

KEY QUOTES

"No matter how long you keep your foot on the accelerator, if the tank is empty, you aren't going anywhere."

"When distraction is hard to access, you don't have to worry about willpower. You can channel your energy into making time instead of wasting it."

"We fear being out of the loop, but once we're out there, we realize it's actually kind of nice."

- This may sound extreme, but at least *try it out* for 1 month, 1 week or even 1 day. You can always add back the apps later.

Log out of your apps and websites every time. The hassle of entering your username and password will discourage you from accessing them unnecessarily.

Turn off all notifications on your phone, except for the truly crucial ones (e.g. calendar reminders).

Have a blank home-screen to get a moment of peace when you unlock your phone. Place all app icons from the 2nd screen onward so you need an extra step to access your apps.

Wear a wristwatch so you don't have to unlock your phone just to check the time (and risk getting sucked in).

Go offline periodically. Leave your devices in the office when you go home, or make them highly inaccessible (e.g. put them in a bag then lock the bag in a drawer).

Tactics to Stay Out of Infinity Pools

Clean up your workspace at the end of each day. Sign out of all your accounts, hide the menu bars and turn off your email and chats, so you won't be flooded by notifications the minute you turn on your computer the next day.

Delay your morning check-ins. When you wake up, don't check for updates at once. Use your calm and rested state in the mornings to enter the Laser mode and finish your Highlights.

Each of us is susceptible to different distractions, e.g. Instagram, newsfeeds, email. Block your #1 distraction. Delete that app from your phone, log out each time, or at least turn it off during Laser time.

Ignore breaking news. There's no need to follow the newsfeed 24/7. Just read the news once a week to stay up to date. If something is truly important, you'll hear about it somehow from other sources.

KEY QUOTES

"Notifications are not your friends. They're nonstop attention thieves."

"True breaking news will find you, and the rest isn't urgent or just doesn't matter."

When you're traveling, don't turn on the screen or pay for wifi on the plane. Use the distraction-free environment for your Highlights.

When you have unlimited access to the Internet, you'll be tempted to stay online. Restrict your Internet access by using a vacation timer or other software tools.

Or, cancel your Internet access altogether. You'll still be able to find ways to go online if necessary, but these are likely to be less convenient and more costly. To deter excessive usage.

Beware of time craters, i.e. small distractions that create huge disruptions. For example, a 20-minute meal can lead to a 2-hour food coma. A 30-second social media post might have you returning many times to read others' comments and respond to them.

Ignore fake wins, such as social media "likes" or responses to emails which don't truly create an impact. Focus on your Highlights because that's where your real wins lie.

Every successful app serves a purpose, even Infinity Pools. You can convert distracting apps into useful tools by changing how you use them:

- Define *why you use an app*, how it adds value to you, how much time you want to invest in that activity, and if that app is the best way to achieve your goal. For example, is Instagram the best way to stay in touch with your friends?

- *Match the tools to your objectives*, e.g. limit the time you spend on a tool, or switch to a better tool. JZ limits his Twitter access to 30min daily, and uses that time to share about his work and address readers' questions. Jake limits his browser time to 4min daily so he's hyper-deliberate about how he uses that time.

Avid sports fans spend lots of time following every match and news update. You can still support your favorite team(s) by following some games/news and freeing up time for other priorities.

KEY QUOTES

"Small distractions create much larger holes in our day."

Tactics to Slow Down your Inbox

The faster your clear your emails, the faster people respond and expect instantaneous replies. So, the best way to manage your emails is actually to slow them down.

Check your emails at the end of the day. Reserve your peak hours for your Highlights.

Schedule email time in your calendar and only manage emails during the allotted time.

Clear your inbox once a week. You can glance through your inbox daily, but only reply to those that truly require a response.

Treat your emails as letters. We typically take a few days to open and respond to snail mail. Do the same for your emails.

People email you about their priorities when it's convenient for them. Answer your messages in batches and respond as slowly as possible—take hours, days or even weeks before you reply. If something is really urgent and important, they'll find a way to contact you.

Manage expectations with a message like "I'm busy with a few important projects and will be slow to respond. Please send me a text if your message is urgent."

Set up "send-only emails" on your phone so you can still send reminders, notes or materials without dealing with a busy inbox.

Go off the grid when you're on vacation. Delete your email app and Infinity Pools, leave your laptop behind and enjoy your holiday fully.

If you lack the willpower to stay away from your emails, use software or apps to lock yourself out (except during pre-allotted time slots).

KEY QUOTES

"Instant-response insanity is our culture's default behavior."

Tactics to Reduce TV Time

Most of us spend way too much time on TV. Make it an occasional treat instead of a default leisure activity.

- Stop watching the news. It's much better to read the news once a day or once a week.
- Place your TV in an inconspicuous corner of the room.
- Replace the TV with a projector. It's more troublesome to set it up, so you'll use it less but can enjoy a cinema-like experience for special occasions.
- Cancel all subscriptions with unlimited content, and only buy/rent ala-carte movies or episodes.
- Go cold-turkey for a month. Unplug your TV and store it away. After 1 month, you may decide it's not worth bringing it back out.

Tactics to Get in Flow

- Close the door and/or put on your headphones to signal to yourself and others that it's Laser/focus time.
- Invent a deadline so you'll be motivated to finish your Highlight. Get a friend to hold you accountable, or register for an event (e.g. a 10km run) that you must work toward.
- Break down your Highlights into small, easy-to-do tasks. Express them using action verbs, e.g. "research airfares for vacation".
- Use music as a cue. Play a song or album each time you start on a Highlight, and reserve those song(s) exclusively for Laser time. After a while, your brain will automatically enter a focused state when you play the music. You can even have different music for different types of Highlights.
- Use a visible timer that shows how much time you've used and how much time is left. This will motivate you to stay focused.

KEY QUOTES

"The closed door is your way of telling the world and yourself that you mean business."
—Stephen King

"Tiny doable to-dos help you build momentum and lock into Laser mode."

Stick to simple tools that are always available and reliable. Don't bother with fancy tools which can complicate things or break down.

It's easier to get into Laser mode when you start on paper instead of a screen, since you think differently on paper, and won't get distracted by things like font type or size.

Tactics to Stay in the Zone

During your Highlights, park random questions and issues on a separate list as they pop up, so you won't go off-track.

To stop the clutter in your head, pause and focus on 1 breath. Notice how the air enters through your nose and fills your lungs, and how your body relaxes as you breath out through your mouth.

Learn to sit with your boredom and let your mind wander. Creative ideas often emerge from such moments.

When you're stuck, allow the problem to incubate in your mind as you take a walk, switch to screen/paper, etc.

If you can't get in Laser mode no matter what, then take a day off to do something truly enjoyable and energizing.

Sometimes, you can't get/stay in the zone because your heart isn't really in it. Switch to a task you can immerse in wholeheartedly.

3) Energize: Recharge your body and brain

You need energy to stay disciplined and focused, so make sure you recharge your body and brain throughout the day.

Our body is like a battery. When your battery is flat, it's hard to think clearly or resist Infinity Pools. When your battery is full, you feel sharp, alive and ready to take on the world.

Since homo sapiens first appeared on Earth ≈200,000 years ago, we've led a hunter-gatherer lifestyle which involved (i) a wide variety of natural foods, (ii) constant movement

KEY QUOTES

and (iii) lots of leisure time for human connection. This changed drastically in the last 12,000 years due to the agricultural, industrial and infotech revolutions. Today, our modern lifestyle has become extremely out of sync with our hunter-gatherer bodies. The good news is, we can recharge our bodies naturally by incorporating simple daily practices.

Tactics to Keep Moving

One of the best ways to recharge your body is to exercise daily in moderation.

- Ideally, exercise for *≈20mins daily* to develop a habit.
- If that's too ambitious, then *do what's doable* and celebrate every progress. Even exercising for 10mins 3-4x a week can make a difference.

The human body is designed for walking. This can be easily incorporated *into* your daily activities, instead of adding it *on top* of them. For example, you can walk to work instead of taking the train, park your car farther from the building, and use your walking time to think, plan and reflect.

Choose "energizing" over "convenience". Try cooking (and moving around the kitchen) instead of eating out, or taking the stairs instead of the elevator.

Go for super-short, intense workouts (e.g. pushups, weights, squats, lunges) to recharge your battery quickly in just a few minutes.

Tactics for Eating Real Food

Adopt a hunter-gatherer diet, i.e. eat whole, unprocessed foods like fruits, vegetables, nuts, seafood and meat.

Fill the center of your plate with salad or greens before adding other denser, higher-calorie foods.

Try intermittent fasting, e.g. have an early dinner, skip breakfast and have a big lunch, so you'll go almost 16 hours without food.

KEY QUOTES

"If you want energy for your brain, you need to take care of your body."

"What you do every day matters more than what you do once in a while."
—Gretchen Rubin

Alternatively, snack throughout the day: consume quality snacks and eat only when your brain/body requires it.

Replace sugary desserts with dark chocolate, which has less sugar and a host of health benefits.

Tactics for Using Caffeine Optimally

Caffeine doesn't give you extra energy; it simply blocks the signals from *adenosine* which tells your brain that you're sleepy. Once the caffeine wears off, the *adenosine* can hit you all at once to cause headaches or fatigue. So, caffeine should be used intentionally and optimally.

You don't need caffeine first thing in the morning since your body typically produces high levels of cortisol around 8-9am to help you wake up fully. Take your first dose of caffeine around 9.30-10.30am when your cortisol level starts to drop.

As a rule of thumb, caffeinate 30 minutes before your energy dips, e.g. just after lunch at around 1.30pm or 2.30pm.

If you're already tired, then take some caffeine followed by a 15-minute caffeine nap. By the time you wake up, your body would've absorbed the caffeine.

Use caffeine for a turbo boost before you start on your Highlight.

Maintain your energy levels throughout the day by substituting 1 large dose of caffeine (e.g. a big cup of coffee) with smaller doses of caffeine (e.g. 2-3 cups of green tea).

After 5-6 hours, half of the caffeine will still be in your system. So, you should generally avoid coffee after 4pm to avoid disrupting your sleep at night. Run your own experiments to figure out your ideal cut-off time.

Many caffeinated drinks come with lots of sugar. Where possible, choose caffeine without sugar (e.g. unsweetened tea/coffee).

KEY QUOTES

Tactics for Getting Off the Grid

Spend some time with nature and fresh air, e.g. go for a stroll in the park, or a hike in the forest.

Calm your mind. Try meditatation, which is basically about being still and noticing your thoughts (instead of actively thinking them). You can try variants like using a guided meditation app, or simply having some quiet time.

Resist the urge to fill your mind every minute of the day. Occasionally leave your headphones at home when you walk, jog, or go about your day.

Take real breaks by moving around, talking to people, or gazing out of the window. Stay away from the screen or Infinity Pools as they'll tax you (not rejuvenate you).

Tactics for Making Human Connections

All humans need human connection. So, spend time with people, especially interesting or high-energy people you enjoy being around. Go for face-to-face interactions or phone conversations (i.e. exchanges that involve your voice). Observe your energy levels after each interaction to identify the energy-givers vs energy-sappers.

Avoid screens during meals. Use the time to interact with people, enjoy your meal, or just give your brain some quiet time.

Tactics for Improving your Sleep Quality

Create a conducive sleep environment. Gradually reduce the mental stimuli at the end of your work day so you can wind down. Ideally, keep all devices (including phones and TV) out of the bedroom. Use a physical alarm clock and read paper books/magazines. If you must read digital content, use a distraction-free device.

KEY QUOTES

"Meditation is just a breather for your brain."

"Resist the itch to fill the blank space."

Simulate the sunset/sunrise. Our body uses light to gauge when it's time to sleep or wake.

- *Fake your own sunset*: (i) turn down the lights in your home
- in the evening, (ii) switch all electrical gadgets to "night mode" and leave them outside the bedroom, and (iii) make your bedroom as dark as possible (or wear an eye-mask).

- If you still feel lethargic in the morning, try *simulating a sunrise* using LED lights.

Take short naps to recharge and refresh.

Don't sacrifice sleep during weekdays, then try to catch up on sleep over the weekends. You can't clear your sleep-debts that way. Instead, maintain your energy levels daily, regardless of whether it's a weekday or weekend.

In an airplane emergency, you're reminded to wear your oxygen mask first before you try to help others. Likewise, take care of your physical and emotional needs first, so you have the energy for things that matter.

4) Reflect: Adjust and improve your system

Use a few simple notes to reflect on your day and decide on the tactics to continue, refine or drop.

The 87 tactics above came from the authors' research and experiments. However, what worked for them may not work for you. This final step is about refining your strategies/ tactics to suit your lifestyle and goals, using a 4-part scientific approach:

- Observe what's happening;
- Hypothesize why it's happening;
- Run experiments to test your hypothesis; and
- Measure the outcomes.

Take notes daily to track what works for you:

KEY QUOTES

- Record (i) your Highlight for the day, (ii) whether you made time for it, (iii) your Laser/focus level (on a scale of 1-10), (iv) your Energy level (on a scale of 1-10), (v) the tactics you tried and how they turned out, and (vi) the tactics to try the next day.

- Record a moment you were grateful for that day.

Conclusion and Other Details in the Book

You don't have to try everything in this book. Just take baby steps to start making time for what you care about, instead of waiting to do them "someday". If you're still unsure about where to start, simply try out these tactics for 3 days, then decide what to keep or adjust:

1. Highlight	2. Laser	3. Energize	4. Reflect
Schedule your Highlight to own your day.	Block your #1 distraction for a day and see how it feels.	Walk a few minutes a day.	Take notes each evening.

This a fun, humorous book packed with illustrations, personal snippets and anecdotes, including the authors' own experiments and experiences. The book also includes sample templates, reading lists and extracts from Jake/JZ's typical day. For more details and free tools/tips, please visit maketimebook.com

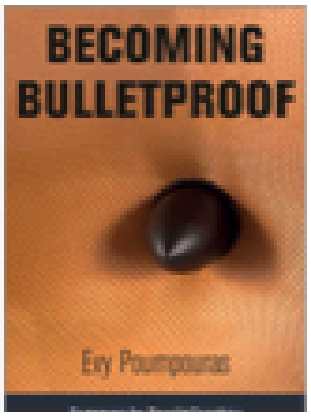
About the Authors

Jake Knapp is an American author and designer. He spent 10 years at Google and Google Ventures, where he invented the Design Sprint process. Jake also co-founded Google Meet and helped to build products like Gmail and Microsoft Encarta. He has written two books, Sprint and Make Time, and coaches teams on design strategy and time management. For more details, visit https://jakeknapp.com.

KEY QUOTES

"The goal is to make time for what matters, find more balance, and enjoy today a little more."

"Do not ask yourself what the world needs. Ask yourself what makes you come alive, and then go do that. Because what the world needs is people who have come alive."
—Howard Thurman



BECOMING BULLETPROOF

Protect Yourself, Read People,
Influence Situations, and Live Fearlessly

Evy Poumpouras

The Big "So What"

Evy Poumpouras is a former U.S. Secret Service (USSS) agent. In this book, she explains various strategies and tools to build mental strength, enhance personal safety, sharpen emotional intelligence, and influence situations positively.

Introduction

In high-stakes situations, it's critical to stay calm and plan ahead, yet most people succumb to fear and panic. In this book, Poumpouras shares how to master your fear to face any situation with confidence. For instance, she was in one of the New York World Trade Center towers during the 9/11 terrorist attack. She maintained her composure to help those in need, and received the USSS Valor Award for her response.

In this summary, we'll be presenting the key insights in 3 parts:

- *Protection*: Strategies for personal safety and mental fortitude;
- *Reading people*: Techniques to read body language, recognize deceit, and control your emotional responses.
- *Influence*: Methods to effectively engage with others, command respect, and create a positive impact.

KEY QUOTES

"I want to help you build the mental attitude you need to confront your own unique set of fears and challenges and learn how to become your own protector—as well as the protector for those you love."

"In a life-or-death situation—when calm, careful planning, and logical thinking are what's needed most—research shows that most of us will lose our shit."

"When it seems like the world is ending, being willing to help others is the antidote to fear. And that is the first step toward becoming bulletproof."

Part 1: Protection

Don't Try to Eliminate Fear. Harness It.

To conquer your fears, you must first understand them. Fear is a natural response to perceived threats, and it's vital for survival. Panic, on the other hand, impairs reasoning and planning.

- Humans are born with innate fears of falling, loud sounds, sharp teeth, and other potentially-deadly threats. That's why we jump at sudden noises, or startle awake when we dream of falling.

- Yet, most of our fears—such as fears of failure or rejection—are not life-threatening. These are learned from culture, experiences, and media sensationalization.

In fearful situations, we instinctively fight, flee, or freeze. Know your default response to better prepare for tense situations. Reflect on what you did the last 3 times you felt threatened. Did you:

- Confront the threat to *fight* for yourself or your loved ones?

- *Flee* or run from the danger?

- *Freeze* or become immobilized by fear?

Choose to **master your fear**. Don't let it control you nor try to eliminate it.

- The *theory of possible selves* by Hazel Markus and Paula Nurius suggests that our current choices are guided by who we want to be (e.g. a renowned inventor), and who we don't want to be (e.g. a failure or pauper).

- *Focus on your aspirational self*, and use fear as a source of motivation. Remember: the long-term pain of regret will outweigh any short-term discomfort.

  (i) Poumpouras was born to Greek immigrant parents in America, and grew up in a low-income area of New York City. Concerned for her safety, her parents often insisted that she stayed home, and even forbade her to attend a top

KEY QUOTES

"Being fearless is bullshit... Fear is natural, useful, and it keeps us alive."

"Under extreme circumstances, panic is likely to kill you faster than whatever it is you're afraid of."

"Survival is about mastering yourself and your fear response, being able to think and act while keeping your panic at bay."

"Courage is knowing what not to fear."
—Plato

"Fear keeps us alive, but...fear can keep us from living."

Part 1: Protection

Don't Try to Eliminate Fear. Harness It.

To conquer your fears, you must first understand them. Fear is a natural response to perceived threats, and it's vital for survival. Panic, on the other hand, impairs reasoning and planning.

- Humans are born with innate fears of falling, loud sounds, sharp teeth, and other potentially-deadly threats. That's why we jump at sudden noises, or startle awake when we dream of falling.

- Yet, most of our fears—such as fears of failure or rejection—are not life-threatening. These are learned from culture, experiences, and media sensationalization.

In fearful situations, we instinctively **fight, flee, or freeze**. Know your default response to better prepare for tense situations. Reflect on what you did the last 3 times you felt threatened. Did you:

- Confront the threat to *fight* for yourself or your loved ones?

- *Flee* or run from the danger?

- *Freeze* or become immobilized by fear?

Choose to **master your fear**. Don't let it control you nor try to eliminate it.

- The *theory of possible selves* by Hazel Markus and Paula Nurius suggests that our current choices are guided by who we want to be (e.g. a renowned inventor), and who we don't want to be (e.g. a failure or pauper).

- *Focus on your aspirational self*, and use fear as a source of motivation. Remember: the long-term pain of regret will outweigh any short-term discomfort.

  (i) Poumpouras was born to Greek immigrant parents in America, and grew up in a low-income area of New York City. Concerned for her safety, her parents often insisted that she stayed home, and even forbade her to attend a top

KEY QUOTES

"Being fearless is bullshit... Fear is natural, useful, and it keeps us alive."

"Under extreme circumstances, panic is likely to kill you faster than whatever it is you're afraid of."

"Survival is about mastering yourself and your fear response, being able to think and act while keeping your panic at bay."

"Courage is knowing what not to fear."
—Plato

"Fear keeps us alive, but...fear can keep us from living."

high school that required her to take public transportation daily. She felt constrained by fear and resolved not to let it limit her life.

(ii) Despite her family's objections, Poumpouras joined the New York City Police Department (NYPD) Academy. During the rigorous training, she focused on the strong, capable woman she aspired to become, and used her fear of regret as fuel to excel.

(iii) She concurrently applied to the United States Secret Service (USSS), and embraced the challenge when the opportunity came. She worked tirelessly to pass the federal agent training and prove herself in a male-dominated environment. She eventually succeeded as a member of the *USSS Special Agent Division*, specializing in investigations and protection for the Presidential family, foreign dignitaries, and major events.

Building Mental Strength and Resilience

In life, you might have to face insults, verbal abuse, or trauma without losing your composure. A strong **mental armor** allows you to engage with people and life experiences confidently, while protecting yourself psychologically from negativity and intentional harm from others. However use such armor judiciously so as not shut out the entire world.

Avoid unnecessary danger and conflict.

- Identify and avoid potential "*hot zones*", i.e. dangerous places or people that can hurt you or reduce your self-worth.
- Avoid *futile confrontations*. In such cases, walking away is a strategic choice, not a weakness. When someone provokes you with an insult/slander, ask yourself: "Do I really need to respond?" Weigh any impulsive reactions against your long-term goals. For example, punching someone will not make him more cooperative.

Hormesis is the process of building strength through controlled exposure to stress. In medicine, low doses of viruses in vaccines are used to trigger the body's immune responses. Likewise, secret agents are trained under extreme pressure to improve their ability to function under stress.

KEY QUOTES

"Fear doesn't have to limit you...sometimes it's about learning how to use and harness your fear to achieve what you truly want out of life, to become the strongest version of yourself that you can possibly be."

"Difficulties are things that show a person what they are."
—Epictetus

"Your mental armor is an internal firewall against the harmful words or actions of others that might otherwise undermine or diminish you."

"If you don't like drama, then don't invite it in."

"It takes great courage to fight. But it takes greater courage to know when to walk away."

- Confront your fears in *small, controlled doses* to prevent them from overwhelming you. For instance, Poumpouras overcame her fear of cold by gradually acclimatizing herself through cold showers, winter surfing, and other activities.

- Use these steps to *build mental toughness*:

  (i) Expose yourself to uncomfortable but manageable stressors.

  (ii) Know your default fight-flee-freeze response, and identify suitable improvement strategies, e.g. endure stress for just a little longer, or plan ahead for stressful scenarios.

  (iii) Keep practicing 1 improvement strategy at a time.

In times of crises, you need **mental resilience** to stay composed, solve problems logically, and recover quickly.

- To solve complex problems, you must first *pinpoint the correct issue*. Try viewing a challenge from different perspectives, including switching to a third-person viewpoint to gain objectivity.

- Don't adopt a victim mindset to blame other people or external events. Instead, adopt a *solutions mindset*:

  (i) Give yourself some time to process your emotions and come to terms with your situation.

  (ii) Then, accept your current realities, and take full ownership for finding a solution.

- The best way to overcome a tragedy is to *focus on making a positive difference* in spite of it. In "Man's Search for Meaning", Viktor Frankl observed how survivors in Nazi concentration camps managed to transcend their suffering by finding meaning in it.

- To *shift your mental-emotional state*, change your environment, engage in physical activities like singing or cooking, or allow some time to pass to gain distance and clarity.

KEY QUOTES

"Fear is like fire. If you extinguish it while it's small, it won't become an inferno."

"[Take] ownership of your problem so that you can also take ownership of the solution."

"Your ability to accept a situation—the real situation—will ultimately help you overcome it."

"When we can find meaning in our personal tragedies and use them as a way to enhance our lives, or the lives of others, we'll emerge stronger and more resilient."

Be Your Own Secret Service Agent

The USSS Presidential Protective Division has an Advance team that sets up layers of security to protect against potential treats, as well as a Shift team that handles defensive responses when the layers of security are penetrated. Emulate this with a **tiered strategy**: plan in advance for personal safety *and* be prepared for emergencies.

Protect yourself and your loved ones by **planning in advance**, i.e. put security measures in place before anything happens.

- *Identify safe houses*, i.e. safe havens like hospitals, police departments, and firehouses in your vicinity. Choose a rendezvous point for your loved ones to meet during a crisis.
- *Memorize the routes* to these safe houses, so you don't have to rely on the internet or navigation devices during a crisis. Be prepared to seek help rather than wait to be rescued.
- Distinguish between *hard targets and soft targets*. "Hard targets" are places like stadiums or landmarks with lots of people and media presence, making them high-risk targets for attacks. "Soft targets" are places with lower risk and less security, like schools or restaurants.
- *Educate your children* about safety and emergency responses. Ensure they know the escape routes, essential contacts, and family-designated safe houses.
- Be cautious when *transiting between locations*—that's when you're the most vulnerable. Avoid remote parking lots, be alert when walking to/from your car, and lock the door once you enter.
- For *international travel*, research local advisories, plan routes in advance, avoid night travel, carry minimal valuables, have a first-aid kit, use secure communication, and familiarize yourself with the local cultures/laws, as well as the nearest hospital, embassy or consulate.

Be **physically and mentally prepared** to respond effectively during an emergency.

KEY QUOTES

"Pay attention to your enemies, for they are the first to discover your mistakes."
—Antisthenes

"Arming yourself with knowledge and tools will free you from unnecessary stressors and worries so that you can live fearlessly."

- Develop *situational awareness* to preemptively recognize dangers. Trust your instincts and err on the side of safety.

- Look for *cover and concealment*. A cover is something that makes you harder to hit (e.g. a fire hydrant or a steel door) while a concealment hides you completely from an attacker's view.

- Identify the *entry and exit routes*. In a panic situation, use alternative exits instead of following the crowd. If you can't reach an exit, then look for impermeable rooms like bathrooms or walk-in coolers, stairwells and possible rooftop escapes.

- In public places, choose *strategic seating positions*, such as having your back to a wall (so you can see what's going on around you) or being near an exit.

- Take 5 minutes to *assess a new environment*. Identify (i) exit points and an evacuation route, (ii) potential cover and concealment spots, and (iii) potential self-defense tools.

Use these strategies to enhance **personal and property security**:

- Enhance *home security* with exterior lighting or motion-sensor lights. Avoid landscaping that offers hiding spots, keep your property tidy to indicate vigilance, keep doors and windows locked, use curtains for privacy, know your neighbors, and consider using a guard dog or warning signs.

- Reinforce your *doors* with robust frames and king studs, install dead bolts that penetrate deep into the frame, add secondary dead bolts, choose solid-core doors, and consider door jammers for internal reinforcement.

- Choose suitable types of glass (tempered, laminated, Plexiglas) for *windows*. Secure basement windows as they're common intrusion points.

- Install motion-triggered *cameras*, or use fake cameras if a real system is not feasible.

- *When you're away*, stop mail delivery and be cautious about what you reveal in your social media posts.

- Prepare a "*go-bag*" for emergency situations, with essentials like cash, a credit card, flashlight, non-perishable food, water, first aid kit, utility knife, and cell phone charger.

KEY QUOTES

"You shouldn't surrender your personal safety to strangers who may or may not be better qualified than you."

"If you do not expect the unexpected, you will not recognize it when it arrives."
—Heraclitus

- Carry only essential items in your *wallet*, with a limited number of credit cards and cash.

- Don't reveal *personal information on social media*, including your home/vehicle interiors or your children's activities.

Avoid violence, but be prepared for unavoidable confrontations. If you must fight, then **commit to the fight mentally and physically**.

- Most bullies and human predators prey upon others to hide their own insecurities; they target those who seem weak. Adopt a *counter-predator mindset* to deter potential attackers: move with confidence, make eye contact, and show situational awareness.

- Learn and practice *self-defense techniques*, such as striking the groin, kicking the shin, punching the throat, or jabbing the eye. If possible, train in a controlled environment to understand your physical limits and reactions under attack. Remember: the goal of self-defense is to escape, not engage in prolonged combat.

KEY QUOTES

"During those times in your life when you decide to stand your ground, do so with conviction."

"If you lack conviction, the belief in what you are doing and why you're doing it, you will lose before the first punch is ever thrown."

Part 2: Reading People

Reading Others to Uncover the Truth

Everyone lies for various reasons, ranging from kindness to fear and self-interest. Poumpouras was one of the USSS' 30 polygraph examiners, and had extensive training and experience in detecting lies.

- *People lie in 3 main ways*: (i) by omission, (ii) mixing lies with truth, and (iii) outright fabrication.

- When we lie, our bodies respond physically to the stress of lying. The *polygraph machine* is designed to measure physiological responses to stress, not to directly detect lies. A skilled examiner is still required to interpret these signs and uncover the truth.

- To recognize a lie, you must *listen actively and closely observe* their behavioral cues. Poumpouras shared several examples of how she identified red flags during polygraph examinations.

"Learn to be silent. Let your quiet mind listen and absorb."
—Pythagoras

Human nature is complex, and there's no such thing as a "good" or "bad" person. To accurately read and understand people, you must learn to see their inherent complexities and contradictions.

- It's harder to spot the lies by those closest to us because our emotions get in the way. To become an effective lie-detector, you must detach personal feelings from your evaluations. Accept that lying is a part of human nature, and don't take it personally. *Focus on gathering information* about their background, motives, and actions, to make a more accurate assessment.

- To uncover the truth, you must *empathize with others*. Seek to understand the "why" (the complex motivations and circumstances) behind the "what" of their actions.

Verbal and Non-Verbal Cues

People's responses are influenced by many factors. To avoid jumping to premature conclusions, establish their baseline behavior in a relaxed state, then look/listen for changes as the conversation shifts to other topics.

- Start by asking casual questions to observe and establish their baseline. Then observe if specific *triggers or topics* lead to shifts in behaviors that suggest discomfort or potential dishonesty. However, don't point out the "tells" that gave them away, e.g. "Why did you look away when you said that?" Just keep them talking and continue to observe attentively.

- Pay particular attention to *discrepancies* between their verbal and nonverbal communication, e.g. shaking their head when saying "yes".

- For a more complete picture, look for *clusters of behaviors* rather than isolated gestures.

Body language, including facial expressions, gestures, and postures, are all windows into someone's inner state.

- Once you've established their "normal" level of *eye contact*, notice sudden changes that signal discomfort, e.g. looking down, fleeting eye-rolls, or widening of the eyes.

KEY QUOTES

"To see a lie, we need to take ourselves and our emotions out of the equation."

"Most people are good people, and sometimes good people do bad things, or stupid things, or both."

"The more you talk, the less control you actually have. When you're reading people, silence is your friend. Listening is your friend."

"Reading people means looking beyond categories and stereotypes. It means seeing people in all of their complexity and contradiction."

- Tension in the *mouth*, sighs and yawns may indicate stress. In addition, clenched jaws, grinding teeth, or a dry mouth, can indicate nervousness.

- Genuine *smiles* transform your entire face (including the eyes) while fake smiles are often fleeting and involve only the lower half of the face. Laughter can signal nervousness and doesn't necessarily mean amusement.

- *Leg movements*: Bouncing legs or tapping feet may signal anxiety, especially if they only occur during specific topics.

- Other signs of *nervousness* include: hiding their hands in their pockets or under their legs, fidgeting or grooming (e.g. twirling their hair or moustache).

- Their *posture and body orientation* also offer insights. An upright posture typically conveys confidence or defiance, while slouching or leaning to one side may convey weakness, fear, or guilt. Crossed arms could indicate defensiveness. The direction of their legs (pointing toward you or the exit) could signal engagement or a desire to exit the interaction.

Verbal communication is equally telling. Pay attention to their tone, choice of words, and inconsistencies or evasions in their narrative.

- Here are some *verbal patterns that may indicate deception*.

  (i) Attempts to shut down the inquiry e.g. "You've already asked that" or "This is such a stupid question."

  (ii) Implying shared knowledge, e.g. "As you already know..."

  (iii) Responding with a question (which can be a stalling tactic), e.g. "You're asking what I did last night?"

  (iv) Impatience or trivializing the issue e.g. "I don't have time for this" or "Is this such a big deal?"

  (v) Lying by omission or refusing to commit to specifics, e.g. "I forgot" or "I'm sure I've already shared everything."

  (vi) Answering a different question, e.g. saying "I usually arrive at the airport 2 hours before my flight" in response to the question "What time did you arrive at the airport?"

KEY QUOTES

"If you know how to pay attention to what people express through their movements and physical mannerisms, you will learn to see the truth beneath the surface."

"Most people, in fact, will not take the trouble in finding out the truth, but are much more inclined to accept the first story they hear."
—Thucydides

(vii) Invoking authority or emphatic denials, e.g. "I swear to God" or "I would never do that!"

(viii) Using their status or identity as a defense e.g. "I'm a doctor/ father/religious person. I would never…"

(ix) Putting you on the defense e.g. "You're picking on me because of my race/gender/religion."

(x) Using disclaimers or integrity qualifiers, e.g. "Trust me…" or "Honestly…"

(xi) Omitting personal pronouns ("I") or speaking of themselves in the third person (e.g. "John is…").

(xii) Using inconsistent verb tenses.

(xiii) Silence or a prolonged delay after a direct question.

- Remember: lies are complex and contextual. None of the signs above are individually conclusive, so always look for *clusters of behavior* that deviate from the person's baseline behavior.

Lying is mentally-demanding, which is why most lies are constructed linearly and with minimal details. Here are several **deception-detection techniques** you can use:

- Let them finish their narrative, then ask about the events in *reverse order*, e.g. "Before you did X, what did you do?" If they spoke truthfully, it will be easy for them to recall the events regardless of the sequence.

- *Listen for details* typically found in genuine accounts:

  (i) Spontaneous corrections, e.g. "Wait…it was blue, not green."

  (ii) Direct quotes of what people said; and

  (iii) Minor details, e.g. a cat dashing across the road.

- Use *paired storytelling* to check for consistency in narratives by co-conspirators. Interrupt 1 person half-way and get the other person to continue the story. A true story will flow smoothly between them.

- Ask *open-ended questions* to encourage them to share details, some of which can be verified to confirm or debunk their claims.

KEY QUOTES

"The stars never lie, but the astrologers lie about the stars."
—Homer

Managing How Others Read You

First impressions matter. They are made quickly and are hard to change. Dress appropriately for the occasion, and match your **appearance** to your goals, audience, desired image and message.

Keep your **body language** relaxed and open.

- Maintain a *neutral expression* to observe others without revealing your own judgments or reactions. Keep your arms and legs uncrossed, head level, palms unhidden or resting on the table. Maintain appropriate eye contact, and avoid fidgeting or other nervous habits.
- Don't slouch, cross your arms, frown, or openly judge them. *Listen attentively*, nod to encourage them to share more, while maintaining a poker face.
- If possible, *remove physical barriers* (e.g. tables, podiums) between you and others to create connection and openness.

Often, how you say something matters more than what you say. Pay attention to your voice, speech patterns, and other aspects of **paralinguistics**.

- Speak *clearly and assertively*. Generally, a slower pace of speech conveys more confidence and control.
- Avoid *filler words* like "um" or "like".
- Use *silence* and strategic pauses to add weight to your speech.
- *Less can be more*. Only speak when you have something meaningful to contribute.
- Record and listen to your voice, and make adjustments to find and present your *most authentic and powerful voice*.

KEY QUOTES

"Each presentation of you sends a different message. You can and should influence your appearance in order to mirror your message."

"Make sure that you appear positive and interested, all the while revealing nothing and inviting everything."

"Connecting with your audience is just as important as knowing your facts."

"The meaning and strength of a statement is determined not by its words, but by how it is spoken."

"If you want people to respect you, then give them a voice they can respect."

"There is the voice we use. And then there is our true voice."

Part 3: Influence

Building Trust and Rapport

Influence is about **trust and strategic communication**, not coercion, psychological trickery, or manipulation.

- *Words are powerful*. Great influencers strategically choose words that make sense to the other person, so they can steer the conversation without force or intimidation.

- The goal of influence is to achieve *specific, short-term goals* through subtle shifts in perspectives, not to change someone's beliefs or character. For example, when Poumpouras interviewed terrorists, she didn't attempt to change their views of America. She merely put herself in their shoes to extract the information she sought.

To influence someone, you must first **see the world through their eyes** and communicate in a way that resonates with them.

- *Empathy* is about understanding the other person's perspective. For example, "Alex, it sounds like losing your job has been really challenging. It must be tough to navigate the change and uncertainty." Once the other person likes you and believes that you understand them, they'll naturally open up to you. Often, suspects voluntarily shared the details of their crimes with Poumpouras—even though they knew it'd land them in jail—because they felt that she understood and respected them.

- Empathy is different from *sympathy*, which involves sharing in another's pain, e.g. "I'm so sorry about your job loss, Alex. I feel sad just thinking about what you're going through." This may come across as pity, which can backfire.

Rapport leads to **trust and deep understanding**.

- Research shows that when 2 people are in sync, it leads to *neuro-coupling*, where their brains start to interpret things similarly.

- When there's rapport, communication flows effortlessly. People who're in sync also start to *mirror* each other's verbal

KEY QUOTES

"To become a dealer of words, you must first understand that the words you choose are not about you. They're about the person who hears them."

"When you come to recognize and appreciate another person, you add value to their lives, which in turn adds value to your own. This is the quintessential impact of influence."

and nonverbal cues, often without conscious awareness.

(i) You can subtly mirror the other person's body language, speech or paralinguistics to build rapport.

(ii) To do this authentically, bring out the version of you that matches their tone, pace, volume, and other nonverbal cues. However, don't mimic their accents.

- *Keep your ego in check*. Don't dominate the conversation or try to show how clever you are. Let others speak and focus on building rapport.

Keys and Tactics to Influence Others Effectively

Make others feel valued by giving them your **undivided attention**.

- *Remove distractions*. Turn off your phone and put it away to signal that you're prioritizing the interaction, while ensuring you don't miss important cues while checking your phone.
- Make people feel special by *remembering their names*. Repeat the person's name multiple times during your conversation to imprint the name in your mind and build rapport. If you're unsure how to pronounce their names, ask for clarification.

You can't demand respect. You can only **earn respect through action**.

- *Respect yourself first*. Focus on actions that bring you pride and satisfaction, not on earning others' approval.
- *Respect others' privacy and dignity*. Hold sensitive conversations privately and in a way that preserves their dignity.

Ask the right questions.

- Start with *open-ended questions* to invite detailed responses.

(i) Start your questions with the words "Tell me", "Explain" or "Describe". For example, "Tell me what you like about this proposal?", "Explain what's important to you in your job?" or "Describe the meeting with your boss."

(ii) Focus on drawing out as much details as possible, observing their body language and nonverbal cues as you do so.

KEY QUOTES

"Trust and rapport work hand in hand when it comes to influencing behavior."

"A person's name is to that person, the sweetest, most important sound in any language."
—Dale Carnegie

"The respect you seek must start with you...At the end of the day, the person whose opinion matters the most is your own."

"The right question is usually more important than the right answer."
—Plato

- Avoid *leading, compound, or assumptive questions*.

  (i) Leading questions guide the respondent to a specific answer, e.g. "Was the car blue or green?"

  (ii) Compound questions include multiple questions, e.g. "Was it warm and comfortable?"

  (iii) Assumptive questions include hidden assumptions, e.g. "Why did you try to steal from him?"

- Toward the end of a conversation, use **closed-ended questions** to clarify or confirm specific details.

Priming is a useful influence tactic that uses environmental or contextual cues to subtly steer someone's perception or behavior. For example, you can appear warm, likeable, and trustworthy by offering a warm drink and using words like "help", "sharing", "positive", and "together".

Demonstrate **authority and knowledge** on a topic without being arrogant. Build genuine expertise and articulate it effectively to command respect and attention.

Use **personal space** appropriately for the context and culture.

- Here are some *rules of thumb* for proxemics:

  (i) Intimate space (direct contact to 18 inches) is for lovers or close family members.

  (ii) Personal space (18 inches to 4 feet) is usually for close friends or family members.

  (iii) Social space (4 feet to 12 feet) is for strangers or acquaintances.

  (iv) Public space (more than 12 feet) is good for public speeches.

- *For example*, start by positioning yourself in their social space then move closer gradually to signal the shift to a personal relationship. If them seem uncomfortable, shift back to give them more space. You can also gauge others' response from whether they're moving closer to you or backing away.

We're naturally drawn to people like us. Find **commonalities** to create connection and trust, e.g. similar interests, backgrounds, traits, or even ordering the same meal.

KEY QUOTES

"Do your homework and make smart decisions about whom you choose to trust and why."

"Once you're able to get beyond their barriers and throw off their defenses, people will reveal themselves to you in ways that they normally wouldn't to anyone."

"Let us conduct ourselves so that all men wish to be our friends and all fear to be our enemies."
—Alexander The Great

Other positive influence tactics include:

- *Admitting to mistakes* to show integrity.
- Being *flexible and adaptable* in your thinking and communication.
- *Respecting others' autonomy*. During interrogations, Poumpouras offered the person a choice of where to sit and what to drink.

Learn from Everyone

A mentor doesn't have to be someone more experienced than you. Anyone around you can be a mentor.

- Use *everyday interactions and observations* to learn from people from all walks of life, including their diverse qualities, experiences, and perspectives.
- You can also use *digital resources*, such as books, lectures, and other media to learn from experts worldwide.

Use solitude for introspection and independent thought formation. Spend some time alone each day to find inner clarity.

- Beware of *self-imposed limitations*. Give yourself the opportunity to learn, and consider trying extreme experiences like skydiving to overcome fears in life.
- Focus on your personal progress instead of *comparing with others*.

Poumpouras shared several virtues—generosity, fortitude, gratitude, authenticity, grace, magnanimity, and self-worth—that she admired the most about various U.S. Presidents and First Ladies. These are qualities that all of us can aspire toward.

- From Bill Clinton, she learned *generosity*. Clinton was always willing to give his time and attention to others. He showed genuine interest in people's lives, and had the knack for making people feel as if they were the only person in the room with him.

KEY QUOTES

"We all fuck up. But how we recover from our fuckups is how we differentiate ourselves."

"You can learn just as much from an asshole as you can from a role model."

"Influence is knowing when taking a break from others is in your best interest."

"If you turn every obstacle into a wall you can't get over, you let yourself become the cause of your failures."

- From Hillary Clinton, she learned *fortitude*—the ability to stay unwavering in face of challenges and public scrutiny/criticism.

- From George H.W. Bush, she learned the power of expressing *gratitude* to everyone, including often-overlooked staff and crew.

- From George W. Bush, she learned *authenticity*. Bush was known for his consistent demeanor in both public and private settings, staying true to himself instead of conforming to expectations.

- From Laura Bush, she learned *grace*—to treat every person kindly, thoughtfully, and with tranquility, so people feel better after meeting you.

- From Barack Obama, she learned *magnanimity*. Obama chose to respond to critics with dignity, kindness, and forgiveness, rising above petty conflicts and retaining a broader perspective.

- From Michelle Obama, she learned about *self-worth*. No matter how busy her schedule, Obama prioritized her role as a mother, as well as her fitness and self-care.

KEY QUOTES

"The greatest virtues are those which are most useful to other persons."
—Aristotle

"Self-worth...comes from the small things we do every day to show that we value ourselves."

Conclusion and Other Details in the Book

Being bulletproof is not about being invincible, but finding the strength to endure the unbearable. This strength comes from acknowledging fear, embracing vulnerability, and maintaining a deep connection to your humanity.

"Heroism is quiet....It's about what's in your heart and mind and spirit."

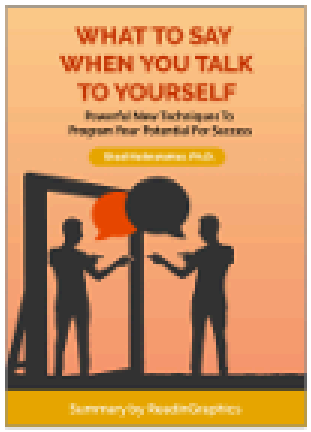
- *Fear is a constant companion in life*, and you will always fear losing the things/people you love. Courage lies not in the absence of fear, but in the willingness to confront and embrace it.

"We are never done with fear...There is...no ultimate state of fearlessness that you can eventually achieve."

- Poumpouras urges each of us to *become our own hero*, and to use our strength and resilience to make a positive impact in this world.

"You are the hero you've been waiting for. You are the hero the world has been waiting for."

The book includes **other details**, such as stories, anecdotes and insights from Poumpouras' experience in life and as a secret service agent. For more details, visit https://www.evypoumpouras.com.



WHAT TO SAY WHEN YOU TALK TO YOURSELF

Powerful New Techniques To
Program Your Potential For Success

SHAD HELMSTETTER, PH.D.

The Big "So What"

We talk to ourselves all the time. Yet, we don't realize that much of what we tell ourselves is negative or counter-productive. This book presents insights from 20 years of behavioral research, with specific steps and phrases that you can use to reprogram your brain, achieve your goals, live your desired life and reach your full potential.

Introduction

Today, we're surrounded by all sorts of success tips and strategies to help us overcome challenges and move forward in life. These include: positive thinking, goal setting, time management, self-belief, self-responsibility, meditation, eating right, and so on.

- Helmstetter spent 20 years researching success from different angles—from psychology to neuroscience, business, philosophy, and religion. He tried out many of the recommended solutions, and also spoke with others who've tried them. Most of these strategies work to some extent, but the *effects tend to be temporary* because they fail to address how our brain works.

- The brain controls *everything* we think and do. To make a *permanent change*, we need to reprogram the subconscious mind, which is the brain's command center. In this book, Helmstetter explains how you can do so using self-talk. It's like the glue that binds together all the other success factors.

The book was originally written in 23 short chapters. In this summary, we've organized the ideas into 2 parts:

KEY QUOTES

"If there are so many good solutions, why aren't they creating permanent changes in our lives?"

"The brain runs the ship. If you want to make a permanent change of any kind...you've got to do it the way the brain works."

- How mental programming works; and
- How to reprogram your brain with self-talk.

Part 1: How Mental Programming Works

How does the brain work?

The brain is made up of billions of neurons that communicate via neurotransmitters. Electrochemical signals are passed between the neurons, triggering chemical releases to our central nervous system and body, which then control everything we do.

- The brain *keeps us alive* by monitoring our needs and managing all our bodily systems (e.g. breathing, digestion) without our conscious awareness.
- It also responds to mental commands in the form of *thoughts*. Every conscious or unconscious thought is translated to electrical impulses that affect some parts of our brain.

Think of your brain like a computer that executes whatever instructions it receives.

- We input data or instructions into a *computer* via a keyboard or touch screen. The data/program is stored in the hard drive, and the programming results are displayed on the computer screen.
- Similarly, the *brain* receives inputs via our 5 senses, i.e. what we see, hear, taste, touch, or smell. The programming is stored in the subconscious mind, and the results are displayed through our actions or appearance.

The subconscious mind is like the brain's command center. It stores our programming, and has countless electrochemical "switches" that control everything from our memory to our health, attitude, fears, logic, creativity, hopes and dreams.

- Your subconscious mind doesn't differentiate between thought and reality. *It believes what it hears repeatedly*. This applies to information about wealth, relationships, health,

KEY QUOTES

"You can reprogram…All you have to do is learn how to talk to yourself."

"What we put into our brains is what we will get back out."

"You will become what you think about most; your success or failure in anything, large or small, will depend on your programming—what you accept from others, and what you say when you talk to yourself."

career, etc. So, you literally become what you think about the most.

Wrong or counter-productive inputs can lead to negative programming that works against you without your realization.

- Behavioral research found that *77% of our thoughts are negative*. Medical research found that 75% of diseases are self-induced.

- When we try to adopt a new success strategy, it often works for a while before we find ourselves falling back to old habits governed by our *old programming*. The only way to change permanently is to change our underlying program.

Where did your programming come from?

From the moment we're born, we receive programming inputs from others. We're told what we can or cannot do, what we're good or bad at, how we should behave, and even what we should believe.

- As *children*, we were full of wonder and imagination, constantly dreaming up possibilities of what we *could* do. As we grew up, we started to learn what we *couldn't* do, and what we *should* or *must* do. We constantly receive (i) direct rules or instructions on what to do (or not to do), (ii) persuasive or marketing messages, and (iii) cues from role models and other social influences.

- Our current mental programming is the sum of *what others have told us repeatedly* over the years. We believe what we hear the most, regardless of whether it's true.

We also talk to ourselves constantly through spoken words, silent thoughts, feelings, impressions, or physical responses. Much of this occurs unconsciously without our awareness.

- Our brain "files" new data based on what we already know, i.e. every new thought or mental image is tied to an existing thought or image. For example, you may identify a new scent by thinking "this smells like vanilla", or you may dismiss something as "untrue" if it clashes with an existing belief.

KEY QUOTES

"Everything around us nudges, demands, or persuades...We are ships with countless captains, all seeking to direct us on their own courses, for their own purposes."

"The more files we have in our mental filing cabinets... the more we will attract and accept other thoughts and ideas which support and prove what is already stored in our files."

As a result, we tend to *reinforce what we already know or believe*. The longer you believe in something, the harder it is to change it.

- Persistent and negative self-talk can create a *self-made wall* that blocks us from our goals. You reinforce that wall each time you tell yourself something counter-productive, e.g. "I'm bad with names", "This is useless", "I'm so clumsy!", or "I'll never get it right." If you keep telling yourself you can't be rich or you can't lose weight, your subconscious mind will make it a reality because that's what you're programming it to do.

In addition, we pass our programming on to others. We often do this unintentionally when we say things like: "You're so self-centered," "You're just like your mum!" or "You'll never amount to anything!"

You can reprogram your brain by changing (i) what programming you accept from others, and (ii) how you talk to yourself. The key is to keep only the helpful programming and replace the rest.

KEY QUOTES

"Whatever 'thoughts' you have programmed into yourself, or have allowed others to program into you, are affecting, directing, or controlling everything about you."

The 5-Step Self-Management Sequence

Your success or failure is *always* the outcome of something you did or didn't do. It's never due to luck alone. There are 5 elements that determine your results: your behaviors, feelings, attitudes, beliefs and programming.

Your behaviors directly affect your outcomes. These include what you do or don't do, what you say and how you say it. You probably won't do well for your exams if you skip classes and don't study. You're unlikely to have a happy home life if you constantly ignore or quarrel with your family members.

Our behaviors are in turn driven by our feelings. You'll respond more positively and enthusiastically to someone/something you

"Life is not a matter of luck or fortune...Most of what seems to happen to you happens because of you—something you created, directed, influenced, or allowed to happen."

like, compared to someone/something you dislike. You behave differently when you're happy and optimistic, compared to when you're unhappy or anxious.

Your feelings are in turn influenced by your attitudes or perspectives about life. All else being equal, someone with a great attitude is more likely to succeed than someone with a poor attitude.

Our attitudes are shaped by our beliefs about ourselves, other people, or the world at large. It doesn't matter if a belief is true; what matters is that *you* believe it's true. Such beliefs tend to become self-fulfilling prophecies. For example, if you believe that people are bad by nature, you'll be more cautious around others. If you believe that you lack creativity, you're less likely to embark on artistic or innovative projects.

Ultimately, our beliefs come from our programming, or how we have been conditioned since young. To change at the core, you need to change your programming.

KEY QUOTES

"[Self-talk] changes the programming, which creates the belief, which develops the attitude, which creates the feelings, which control the behavior."

"What we believe about anything will determine our attitudes about it, create our feelings, direct our actions, and in each instance, help us to do well or poorly, succeed or fail."

Self-Talk vs Other Self-Help Concepts

Positive thinking is a powerful self-help concept. However, it doesn't remove your old programming. This is like trying to renovate a house full of old furniture—you must clear out the old furniture to make space for new ones. In short, you must concurrently delete the old/negative self-talk *and* replace it with new/positive self-talk. Otherwise, your old programming will interfere with your attempt to be positive, and you end up feeling even more frustrated and disillusioned.

Most motivational strategies or techniques don't deliver lasting results because they rely on external motivation or motivators.

- *External motivation* doesn't last because your motivation fizzles out once the motivator is removed. For example:

  (i) You may feel a surge of hope and inspiration after reading a motivating book, listening to a stirring speech, or attending a motivational program. However, after a few setbacks, you find yourself falling back to old ways of thinking, and may even feel more disappointed or disillusioned.

"Most motivation simply doesn't stick. It doesn't stay with you."

"External motivation is the kind that may wake you up, but it will not keep you awake for long."

(ii) You may also feel pressured or obliged to do something due to contractual obligations, fear of punishment, or disapproval. Yet, once the external demands disappear, so will your motivation.

- Instead of relying on external sources of motivation, use self-talk to create *internal motivation* that lasts. It's like having an internal coach or motivator who will never leave you.

It's possible to influence your subconscious mind using **subliminal solutions**, such as *hypnosis* (which puts you in a trance-like state so you become more receptive to suggestions), or *subliminal learning* (e.g. music or images embedded with hidden messages). However, you are still allowing someone else to program your mind.

- Self-talk adopts a different approach. It requires you to make a conscious decision about who you wish to be, then take *personal responsibility* for your own mental programming.

No matter how good an idea is, it won't work if you don't apply it. Most people want to improve their relationships/career, and have more time, money, or freedom. Yet, they get so caught up with the demands of daily life that they can't find the time/energy to take concrete action. Self-talk is simple enough that anyone can use it—if they choose to do so.

Part 2: Reprogramming Your Mind with Self-Talk

The 5 Levels of Self-Talk

There are 5 progressive levels of self-talk. Your goal is to stop unhelpful self-talk (Levels 1 and 2), and start adopting helpful self-talk (Levels 3 and 4). With time, Level 5 will naturally kick in.

- Level 1: Negative acceptance involves saying negative things about yourself and believing them. It's characterized by words like *"I can't..."* or *"If only I could..."* It could range from small

KEY QUOTES

"Vote your own vote, think for yourself, and always be aware of what you are programming into your own subconscious mind."

"Personal responsibility is the bedrock of all individual action."

"For any self-improvement concept to be successful, it has to be simple. It has to be easy to use. And when put into practice, it has to work!"

reservations to deep fears, e.g. "I can't seem to get this right" or "If only I could be more lovable." This is the least helpful way to talk to yourself, since it damages your self-image and confidence.

- Level 2: Admitting the need for change. Such self-talk is characterized by words like *"I need to..."*, *"I ought to..."*, *or "I should..."* Examples include: "I need to lose weight" or "I really ought to be more punctual". The statements may *seem* helpful, but they're actually counterproductive because they point out a gap/problem without a concrete solution. This makes you feel more guilty and frustrated.

- Level 3: Deciding to change. This is the first helpful level of self-talk because it represents a firm decision to do something. It's characterized by words like *"I never..." or "I no longer..."* Examples include: "I never break a promise" or "I no longer eat more than I should". The sentences are stated in the present tense as if the change has already occurred. This instructs your subconscious mind to take action *immediately*.

- Level 4: Being a better me. This is about presenting yourself in a positive new light. It's characterized by words like *"I am..." or "I have"*. Examples include: "I am in control of my actions", "I have a great memory", or "I am a winner!" Such statements inspire us to become the person we wish to be, filling us with hope and excitement.

- Level 5: Universal affirmation. At this level, you're spiritually aligned with the world at large. You use words that describe *what* is, e.g. "Life is beautiful and full of joy and peace." Your self-talk is elevated to a higher level, reflecting a wider perspective and a higher consciousness.

The 5 Self-Talk Techniques

Self-talk may be thought, spoken, written/read, or recorded/listened to. Use some or all of these 5 techniques to shift from negative to positive self-talk.

Silent self-talk refers to your internal dialogues, including all your conscious/unconscious thoughts about yourself and the things around you. The idea is to "catch" any unhelpful thoughts and reframe them *immediately*.

KEY QUOTES

"By replacing your earlier negative or neutral self-talk with new commands, you are activating healthy, productive chemical and electrical control centers in your brain which will automatically work for you instead of against you."

When you say something about yourself to others, it calls up images and feelings that add to your mental programming. For example, each time you tell a friend that you hate your job, or that you can't stand your boss, you're reinforcing those attitudes and sentiments. Pay attention to *everything* you say—if you don't want your brain to receive it as an instruction, then replace the words immediately.

Hold conversations with yourself: talk to yourself aloud for several minutes in private, e.g. when you're in the shower or alone in the car. This is one of the most effective forms of self-talk, since you're engaging multiple senses, and forcing yourself to translate thoughts into words. You can use this to:

- Give yourself a *boost*. For example, say "Hey, you look great today!", then reply with "Yes, it has been an amazing day because...";
- Give yourself *advice*; or
- Ask yourself *questions*. This helps you to voice out answers that you may already know subconsciously.

Written self-talk: Carefully craft the wordings or instructions for your subconscious mind, then read the self-talk daily.

- You can write the self-talk on *index cards*, with 1 statement per card. Over time, you'll have a self-talk for every situation or goal.
- To come up with the most effective wording, you will need some effort and discipline. So, this method works best for people who enjoy *word-smithing*. The process also creates the awareness and focus to accelerate your mental shift.

Recorded self-talk: You can also record your self-talk, then listen to the audios while you do your daily chores or activities. Remember: if you repeat a message enough times, your brain will eventually accept it as the truth.

How to Apply Self-Talk

Effective self-talk involves more than just 1-2 statements. You need to develop a set of specific suggestions to tackle different

KEY QUOTES

"Listen to everything you say when you talk to anyone at anytime."

"Your subconscious mind will be listening, whether you are or not."

"Self-Talk is not one simple phrase or two: Self-Talk is a specific set of concisely worded directions."

aspects of a goal or challenge. The more specific and complete the picture, the clearer the instructions to your brain.

- Be very *specific*: look at the problem carefully, and create a self-talk statement to address each obstacle. Be as precise as possible, since your brain will follow the exact instruction.

- Most goals or problems can be *holistically addressed* with a dozen good self-talk suggestions that jointly cover the symptoms, causes, your mental space and the person you must become.

- With the exception of situational self-talk (elaborated below), all positive self-talk is stated in the *present tense*, as if it has already occurred. For example, don't say "I'm going to quit smoking," since it tells your brain that you're still smoking right now. Just say, "I don't smoke!"

Self-talk for changing habits. All of us have unhelpful habits that we wish to change or replace.

- Use self-talk to tell your subconscious mind (i) to stop doing something (e.g. stop overspending), and (ii) to start doing something else (e.g. only spend what you planned to). Reject the old habit, and replace it with a *new mental image* of yourself behaving in the new way.

- Develop a set of self-talk suggestions to address *all aspects of the habit*. To quit smoking, you can describe how you're enjoying your new state of health, how fit/good you feel, how proud you are of yourself, how you stay in control of your mind and body, and how you respond to cigarettes. Here are 2 self-talk examples:

  (i) "I really enjoy breathing clean, fresh air, being healthy, and being in complete control of my body and my mind."

  (ii) "When I see a cigarette, or even think of one, I automatically hear the words, "I do not smoke!"

Self-talk for changing attitudes. Our attitudes act as filters to affect how we see ourselves and the world. They define who we are and impact everything we do. The best way to change your attitudes is to change how you see yourself.

- For example, your attitude toward *self-responsibility* decides whether you take charge of your life or make excuses for

KEY QUOTES

"Because the subconscious mind does not know what is true and what is not, in time it will accept what you are telling it and act on it."

"To change the habit, change the words."

"We are our attitudes and our attitudes are us."

for yourself. To take full responsibility, develop a set of self-talk suggestions to describe how trustworthy you are, how you never make excuses, and how you take responsibility for your past, present and future. Here are 2 self-talk examples:

(i) "Each day I acknowledge and accept the responsibility for my actions, my emotions, my thoughts, and my attitude."

(ii) "I always meet all of the obligations which I accept. And I accept no obligations which I will not meet."

Self-talk for solving problems and achieving goals. You can set goals for virtually anything, from how you wish to live each day, to what you wish to achieve in the short-term, mid-term or long-term. Goals and challenges are basically 2 sides of the same coin. When you overcome a challenge, you also move closer to your goal.

- Use self-talk to *improve your approach to problems*, e.g.

  (i) "I am good at breaking large obstacles down into smaller pieces that are easier to handle. And I never make any problem seem bigger than it actually is."

  (ii) "I do not fear problems, I solve them. I do not avoid problems, I conquer them!"

- You can also use self-talk to *target specific problems*. Be simple, direct, and craft a self-talk for each aspect of the goal/problem. For example, if your goal is to become more organized, you could use statements like:

  (i) "I know what to do and when to do it, and I do everything I need to do, when I need to do it."

  (ii) "I program my mind to make the maximum use of my time. I am in control of my time and how to use it."

Motivational self-talk. The best way to motivate anyone is to influence their emotions.

- Use self-talk to *uplift yourself emotionally*, boost your confidence, self-belief, and sense of purpose. Examples include:

  (i) "Today is one of those days when nothing can stand in my way. When I need extra determination, I've got it! When

KEY QUOTES

"The attitudes you have about yourself determine the attitudes you will have about everything else around you."

"Some of the most important goals of all...are the goals of everyday living."

"Name the adversary, state the problem, and you can find the self-talk that created it."

"If you would like to be in control of the forces in your life which influence and affect everything you do, then you most certainly would like to be in control of your own motivation."

(ii) I need more energy and drive, I've got it! No matter what the task is, I have the power to get it done and the patience to see it through."

(iii) "I have a lot of energy and I feel alive!"

Our physiology can be changed in an instant, e.g. you may be dozing off but a loud crash gets you jumping up in full alertness. Use situational self-talk to instantly shift your mental, emotional, or physiological state.

- *Change your words to change how you see the situation*. All it takes is just a moment. For example, you're receiving a call from someone you dread talking to. Instead of avoiding the call, tell yourself "I love solving problems. I'll take this call and address the issues head-on." Unlike the other types of self-talk, situational self-talk doesn't require a script. There's also no need to use the present tense since you're preparing for an upcoming activity.

- A single event can create a chain reaction to form a positive or negative cycle. Positive self-talk puts you in a *better frame of mind*, so you can respond in a way that can (i) save yourself hours or days of pain and grief, and (ii) build your confidence and self-esteem.

- When you encounter *events beyond your control* (e.g. bad weather or slow traffic), there's no point complaining or losing your temper. Use self-talk to help yourself accept or even enjoy the situation. For example: "Slow traffic is not a problem to me. I now enjoy the time to organize my thoughts and think about things that are beneficial to me. I will get there when I get there."

Applying Self-Talk to All Aspects of Life

Self-talk is a self-reinforcing habit. The earlier you start using it, the faster you'll form new, positive ways of talking to yourself.

- You may feel some *initial resistance*, e.g. an inner voice telling you that it won't work. Just remind yourself that it takes time to change old habits, and consciously choose *not* to listen to your old programming.

KEY QUOTES

"[Situational Self-Talk] adjusts situations by adjusting how we look at them."

"The more productively we think, the more positively we affect ourselves emotionally and physically."

"If you have made the decision to be in control of yourself, you will talk to yourself in the right way—immediately, directly, realistically, and positively."

- Energize your self-talk by *reading them aloud*, ideally in front of a mirror. The process may feel awkward at first, but it will feel more natural with practice.

- As you *repeat* the messages over and over, you'll start to feel better mentally, emotionally, and physically. Once you improve how you see yourself, it will be easier for you to address specific goals or challenges. Eventually you'll internalize the words to make them a part of your life and who you are.

Anyone can benefit from self-talk since our brains work the same way. You can also apply self-talk to any area or challenge in life.

- If you're in *management*, you can use self-talk to positively shape your own perspectives, attitudes, feelings and actions, and teach your team members to do the same.

- To improve your *financial health*, use 3 weeks of self-talk to see yourself as someone capable and worthy of financial success. Then, develop goals and plans to make it a reality.

- When *parents* use positive self-talk, their children often pick it up naturally as part of their early programming. Developing positive self-beliefs in children is the best way to help them to grow up to do the right things.

- Use self-talk to overcome any *problem or obstacle*. Set clear, meaningful goals and write them down, then use daily self-talk to make it easier to achieve them.

- To improve your *skills or studies*, use self-talk to improve your ability to listen, concentrate, persevere, build good learning habits, and sharpen your memory.

- If you're feeling *lonely or depressed*, use positive self-talk to change how you see yourself and the situation.

To get started, here are several steps you can take.

- In the next 48 hours, *listen carefully* to the self-talk around you.

  (i) Listen to *your own self-talk*. Notice how you react to risks, problems and opportunities, the positive and negative things you say/think about yourself, and the type of internal responses they generate.

KEY QUOTES

"When you determine who you really are inside, and what you are really capable of accomplishing, it is much easier to see what to do next. Start with your programming; the rest will follow."

"If you'd like your child to do the right things, start at the beginning. Start with his or her Self-Talk."

"Any well-set goal deserves the benefit of well-said words."

"Add Self-Talk to your curriculum. You'll get more from school and more from yourself."

(ii) Listen to *others' self-talk*. Notice what they say about themselves, about people/things around them, and how it reflects their beliefs and external motivations.

- For 7 days, pay attention to *media-talk*, i.e. the messages from TV, radio, news media, and what people say about such media-talk. Notice the external influences shaping what you think you should do.

- Once you're aware of the self-talk from yourself and others, you can *decide what to accept and what to replace*.

- You can start by converting your *10 "most-used" negative self-talk* into positive self-talk. For example:

  (i) "I really must exercise more" can be reframed into "I enjoy exercising and look forward to my daily exercise".

  (ii) "What a terrible day it has been!" can be reshaped into "Today was alright. I feel good about myself and it will be even better tomorrow!"

- Use this *checklist* to ensure you've worded your self-talk properly.

(i) It is stated in the *present tense* (except for situational self-talk).

(ii) It is *specific*, with details to address all aspects of the goal or problem.

(iii) It gets the job done without undesired side effects, e.g. "losing weight at all costs" could mean hurting your health.

(iv) It is *simple*, easy to use and remember.

(v) It is *practical*. Start with what you can achieve, then gradually stretch your limits. Don't aim for miracles right away.

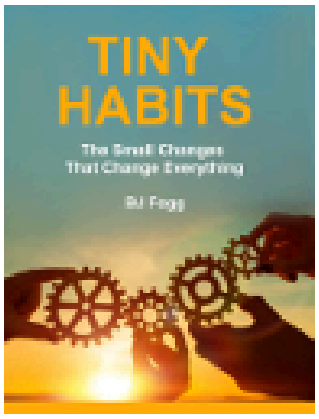
(vi) It is *direct, personal and honest*, to address where you are now and who you wish to become.

(vii) It demands the *best of you*.

KEY QUOTES

"You are everything that is, your thoughts, your life, your dreams come true. You are everything you choose to be. You are as unlimited as the endless universe."

"Vague directions lead to vague results. The more specific you are, the more specific the directions you will be giving yourself."



TINY HABITS

The Small Changes That Change Everything

B.J. FOGG PHD

The Big "So What"

Change is essential, but not always easy. In this book, behavioral scientist Dr. Fogg presents a proven, universal approach to help you understand all types of human behavior, and to design any behavioral change or habit.

Introduction

Everyone desires change at some point in life—be it to become healthier, to learn a new skill, or to improve our relationships and productivity. Yet, it can be hard to break a bad habit or to build a new one.

- After years of research and experiments, Fogg found that the problem with change doesn't lie with us as individuals, but with our approach. This book presents the *Fogg Behavior Model* (a universal model for analyzing and designing all types of human behavior), and *Tiny Habits* (a method to develop habits using baby steps). Together, they can help you to achieve any behavior change.

- This system has been tested with more than 40,000 people and can work for virtually *any behavior* at work, at home, for individuals or groups. In this summary, we've organized the various models, methods and steps into 2 parts:

  (i) An overview of the conceptual frameworks; and

  (ii) The specific steps for behavioral design using Tiny Habits.

KEY QUOTES

Part 1: Understanding Human Behavior

Fogg Behavior Model: The 3 Elements of Behavior (MAP)

The Fogg Behavior Model says that there are 3 universal elements behind human behavior.

B = M A P

Behavior = Motivation + Ability + Prompt

- *Motivation* refers to your desire to do something. The more motivated you are, the more likely you'll perform the action.
- *Ability* refers to your capacity to do the action. The easier the action is, the more likely you'll do it.
- *Prompt* refers the cue to do something, e.g. a reminder for a meeting. No action will take place without a prompt.

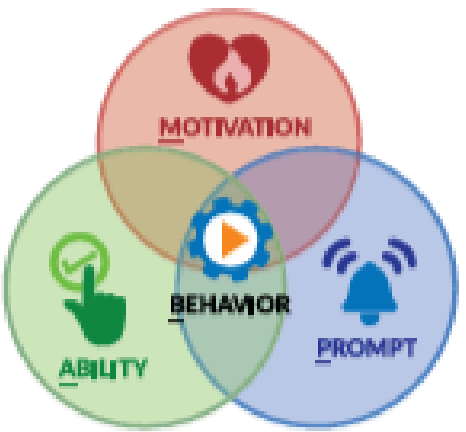
A behavior will occur when all 3 elements converge. For example, you'll donate to a charity if you already wish to donate (motivation), you receive a reminder to donate (prompt) and can donate easily by replying to the text message (ability).

- Once you understand how the elements work, you can use them to design almost any behavior. If someone isn't doing what you want or expect, check if *all 3 elements* are present:

  (i) Is there a prompt for the behavior?

  (ii) Is the person able to do the behavior?

  (iii) Is the person motivated to do the behavior?

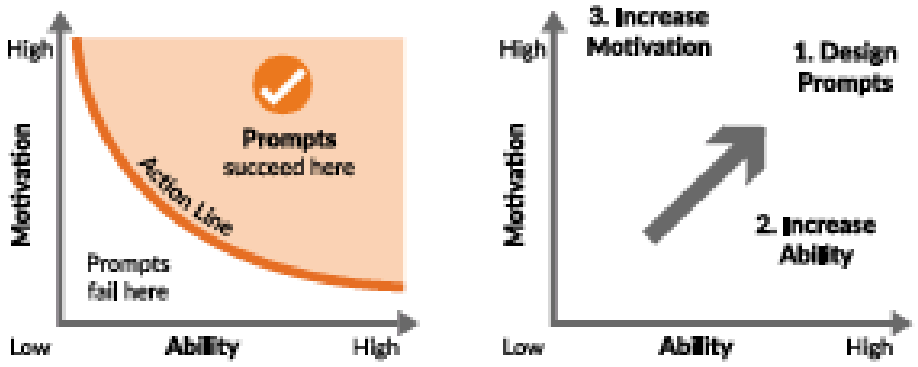


- The goal is to *shift above the "action line"* using MAP:

KEY QUOTES

"Behaviors are like bicycles. They can look different, but the core mechanisms are the same. Wheels. Brakes. Pedals."

Fogg Behavior Model
(B = MAP)



* Adapted from Tiny Habits by BJ Fogg

For each of the 3 behavioral elements (MAP), there are 3 sources that shape behavioral change: Person, Action and Context (PAC).

	Person	Action	Context
Motivation	Does the person want to do it?	Are there external rewards or punishments?	Does the environmental affect motivation?
Ability	Can you increase skill levels?	Can you make it smaller/easier?	Can you get tools & resources?
Prompt	Are there internal or self prompts?	Can existing actions prompt new actions?	Can environmental cues prompt action?

Behavior Change Element #1: Motivation

Motivation refers to your desire to do a specific behavior (e.g. eat broccoli for dinner) or a set of behaviors (e.g. have a healthy diet).

- Your motivation level depends on *3 sources of motivation (PAC)*:

  (i) *Person*: Do you already want to do the action?

  (ii) *Action*: Is there an external reward or punishment for doing the action?

  (iii) *Context*: How does the environment affect your motivation?

Motivation is the least reliable of the 3 elements because:

KEY QUOTES

- We get caught in a *constant tug-of-war* between different factors. For example, you want to donate to a charity to make a positive impact and to enjoy tax reliefs, but hold back because you dislike the representative from the charity organization.

- You may also have *conflicting motives*, e.g. you want to eat a slice of chocolate cake but you don't want the extra calories.

- Motivation also comes in *waves*. You may get a temporary spike of motivation that drives you to quit your job or start on your New Year's Resolution, but you can't sustain your efforts once the wave passes.

- Your motivation level also *fluctuates* from day to day, and even moment to moment. You may feel less motivated to stick to a healthy diet during festive seasons, when you're really hungry, or when you're feeling overwhelmed at work.

The solution is to use **Behavior Matching** to identify the behaviors you already want to do (see Part 2 for specific steps).

Behavior Change Element #2: Ability

Generally, we avoid difficult activities. Even if you can force yourself to do something painful, you'll struggle to sustain it. That's why many people get stuck in a burst-and-bust cycle. They do something dramatic then deflate totally, e.g. do 2 hours of extreme exercise daily, then give up after 1 week because they've exhausted (or even injured) themselves.

- You're more likely to do something that's easy. So, *start with tiny habits* that are easy to do, then build from there. If you want to do 50 push-ups a day, start with just 1 push-up.

Examine **5 factors in the ability chain** that affect your ability to perform a behavior: time, money, physical ability, mental ability, and how well it fits into your current routine.

KEY QUOTES

"Motivation is like a party animal friend. Great for a night out, but not someone you would rely on."

- Identify the *weakest links* in the chain by asking "What's making this hard to do?"

- Then ask, "How can I make this easier to do?" by considering the *3 sources of ability (PAC)*:

  (i) *Person*: How can you increase your skills so the action becomes easier to do? Examples include: doing online research, attending a course, getting a coach, etc.

  (ii) *Action*: How can you make the behavior as tiny as possible? For example, if you want to journal daily, start by opening your journal.

  (iii) *Context*: How can you use tools and resources to make the action easier? For example, it's easier to prepare a healthy meal if you have the right kitchen tools/equipment or a predetermined meal-plan.

KEY QUOTES

"While small might not be sexy, it is successful and sustainable."

Behavior Change Element #3: Prompt

Even if you have the motivation and ability, you won't do an action unless there's an **effective prompt** that's noticeable and appears at the right time.

- Again, there are *3 sources of prompts (PAC)*:

  (i) *Person*: Relying on an internal reminder (e.g. memory or a grumbling stomach), which can be highly unreliable.

  (ii) *Context*: Using something in your environment as a cue, e.g. an alarm going off, or a sticky note on your computer. Remove unwanted prompts (e.g. notifications from your digital devices) so your desired prompts can stand out.

  (iii) *Action*: Using something you already do (an anchor) to prompt something you want to do (a new habit). For example, "After I brush my teeth, I will floss one tooth", or "After I have a drink of water, I will do a push-up".

Part 2: Behavior Design and Tiny Habits

Fogg found that the best way to make a behavioral shift is to go small. Tiny habits are so effective because:

- They're *fast* to do, can fit into any schedule and allows you to start now.
- They're *safe*, unlike big or risky actions. If you make a mistake, it's easy to try again.
- They're so tiny/easy that you don't need to rely on your limited *willpower*.
- Yet, they *add up* over time to deliver dramatic changes.
- Tiny Habits are built on the Fogg Behavior Model and proven steps in behavior design. Basically, you use 7 steps to identify a desired behavior, make it tiny, fit it into your life, then cultivate it naturally.

Behavior Matching (Motivation)

Step 1: Clarify your aspirations. Write down your general aspirations or the specific outcomes you want, e.g. to "feel healthy and energetic everyday" or "lose 10kg".

Step 2: Explore your behavior options.

- Imagine you have a *magic wand* that allows you to do anything you want to achieve your goal/aspiration. Jot down:

  (i) The new behaviors you'd do once;

  (ii) The new habits you'd develop; and

KEY QUOTES

"One tiny action, one small bite, might feel insignificant at first, but it allows you to gain the momentum you need to ramp up to bigger challengers and faster progress."

"The essence of Tiny Habits is this: Take a behavior you want, make it tiny, find where it fits naturally in your life, and nurture its growth."

(iii) The current habits you'd stop.

- Don't confuse aspirations/outcomes with behaviors. An abstract aspiration may inspire you, but it won't tell you exactly what to do. Goals like "lose 10kg" or "save $10,000 of emergency funds" are outcomes. Here, you're looking for *specific behaviors* that can lead to those outcomes, e.g. "replace ice-cream with a square of dark chocolate for dessert" or "put $2 a day into an emergency-fund jar."

★ Step 3: Find a behavioral match. Take 20 minutes to do a Behavior Matching exercise.

- Put each idea above onto a card. Use *Focus Mapping* to plot:

  (i) How *effective* the idea is for achieving your goal/ aspiration. Place high-impact behaviors higher on the map.

  (ii) How *feasible* the behavior is: can you get yourself to do it?

  - Focus on whether you *want* to do it (not if you *should*). If you really don't want to do something, put the card aside.

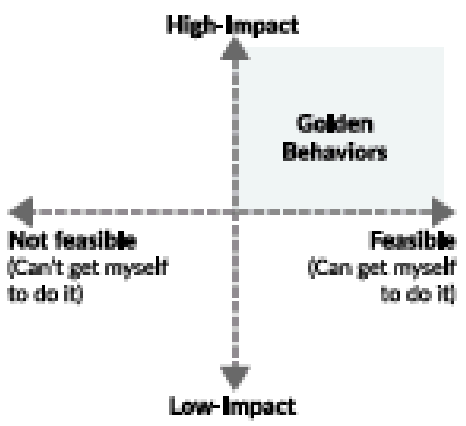
  - Once you've identified what you want to do, you can craft the behavior such that you'll actually do it. For example, if you want to exercise daily, the next thing is to figure out the type/level of exercise that you'd do regardless of how busy or tired you are.

- Your goal is to find the *Golden Behaviors* that meet 3 criteria:

  (i) *Impact*: it can effectively help you to achieve your goal.

  (ii) *Motivation*: you want to do it.

  (iii) *Ability*: you can do it.



These will fall on the top-right corner of your map. They represent the things that you can do and want to do, making it much easier to do the actions and develop new habits.

KEY QUOTES

"No matter what kind of change you want to make, matching yourself with the right behaviors is the key to changing your life for good."

"What you want to do and what you can do will converge into what you most likely will do, and that's the most fertile ground for growing habits."

Design a Tiny Habit (Ability + Prompt)

Step 4: Start with the tiniest action. The easier the action, the greater your ability to perform it.

- Identify a *Starter Step* that's so easy that you have minimal resistance. For example, if you want to run 5km, start by putting on your running shoes. If you want to do 100 push-ups, start by doing just 1 push-up or 2 wall push-ups.

- Once you take that first step, you'll feel good about yourself and the activity, and may end up taking extra steps. Even if you stop at the Starter Step, celebrate it (see step 6 below). The idea is to *lower the bar* until you'll do the Starter Step even on a "bad" day.

- For example, *Instagram* actually started out as a location-sharing app Burbn. The founders realized that people were naturally sharing pictures of their location (the Golden Behavior) but weren't using the other features. So, they removed the extra features, made it easy for people to share photos, and relaunched the app as Instagram with a roaring success.

Step 5: Identify a good prompt to fit the behavior into your existing routine.

- Use Fogg's *ABC template* to design your Tiny Habits: Anchor → Behavior → Celebration.

  (i) Anchor moment = a stable routine or habit in your life.

  (ii) Tiny Behavior = the new habit you want to develop, scaled down into a tiny step.

  (iii) Celebration = something to create a positive feeling ("Shine")

- Identify the series of steps that you already perform in a daily routine, then insert the tiny behavior using this *formula*: After I [insert anchor], I will [insert new habit]. For example:

  (i) After I sit up in bed, I will say "It's going to be a great day!"

KEY QUOTES

"Taking the first step, no matter how small, can generate a sense of momentum that our brains love."

"Combine the right behaviors with the right chronology, and, poof, a new habit is created."

(ii) After I make my coffee, I will open my journal.

- Pair a new habit to an anchor based on *3 criteria*:

  (i) The *physical location* where you want to build the habit;

  (ii) The *frequency* you wish to perform the habit (e.g. 2x a day); and

  (iii) The *theme/objective* (e.g. watering the plants and drinking water are both associated with hydration or nourishment).

- You can try these *tips and variations*:

  (i) Break down a routine to find the *last step in the sequence*. For example, "after I eat breakfast" is less specific than "after I place the breakfast dishes in the sink".

  (ii) You can *reverse the process*, i.e. think of an anchor then think of new habits you can insert.

  (iii) Develop "*meanwhile habits*" to fill pockets of time, e.g. "After I take my place in the queue, I will think of 1 thing I'm grateful for."

  (iv) Explore *prompts for your customers*, e.g. get a patient to measure and report his blood pressure after he sits down with his morning coffee.

  (v) Create *pearl habits* to convert something negative to positive, e.g. "After I hear the neighbor's dog barking, I will take a deep breath" or "After I feel disrespected, I will do something nice for myself."

Nurture/Grow the Habit

Step 6: Celebrate Success. Each time you complete your tiny behavior, make sure you celebrate it. For example, after flossing 1 tooth, Fogg would smile at himself in the mirror and say with enthusiasm "Victory!" This makes him feel good about himself and flossing his teeth.

- *Emotions are what create habits*. We tend to repeat things that make us feel good, and avoid things that make us feel

KEY QUOTES

"Emotions create habits. Not repetition. Not frequency."

bad. Positive experiences encourage us to repeat something until it becomes automatic—that's how habits are created.

- The positive feeling must occur almost *instantaneously* for your brain to link it to the behavior. A delayed reward (e.g. treating yourself to a massage 2 days later) won't work.

- Celebrations are one of the best ways to create the positive feeling of *Shine*—that inner sense of success when you've won a contest, aced a test, or receive a standing ovation.

  (i) Make sure your celebrations are immediate and intense.

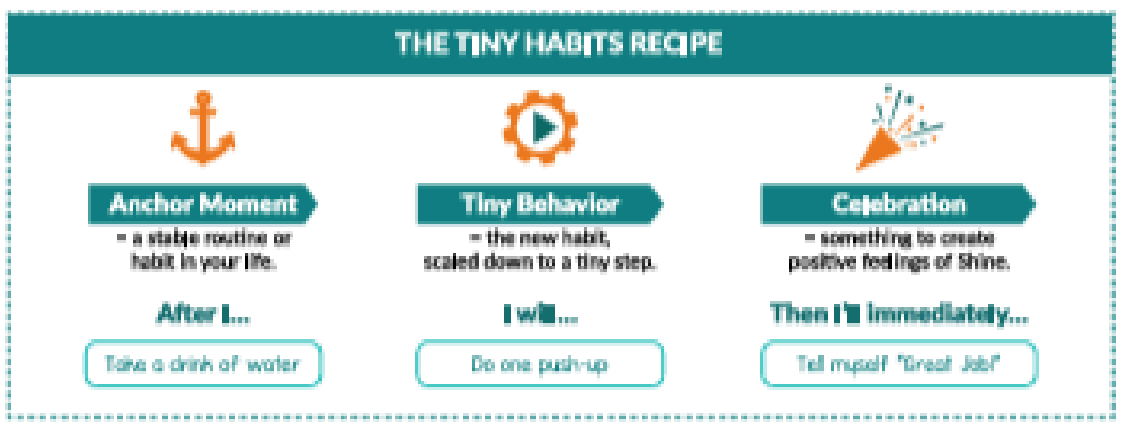
  (ii) Experiment to find what works for you, e.g. shouting "yay!", doing a double fist-pump, visualizing a room of people clapping for you, or thinking "Great job!"

  (iii) Try out different ways to celebrate in public and in private.

  (iv) Reserve a "power celebration" exclusively for habits you want to wire rapidly.

  (v) Don't just celebrate after the action. You can also celebrate when you remember to do the habit, and while you're doing the habit.

- You can combine steps 6 and 7 into this *template*:



- To *wire a habit quickly*, repeat the ABC sequence 7-10x consecutively, e.g. sit down with your coffee, open your journal, say "yay!" with a fist-pump, then stand up and repeat the sequence. It may sound silly, but it truly helps to lock in a new habit.

KEY QUOTES

"Helping yourself feel successful is what Tiny Habits is all about."

"The feeling of success is a powerful catalyst for change."

Step 7: Troubleshoot, iterate, and expand. Tiny Habits grow and multiply naturally to create exponential results over time.

- Tiny habits tend to have a *transformative effect* because:

  (i) Once you get used to a tiny habit, you'll want to increase it;

  (ii) Each habit creates a ripple effect in the wider system of behaviors; and

  (iii) The tiny successes build your confidence and momentum.

- Each time you use the 7 steps to form and refine a Tiny Habit, you'll progressively improve your *change skills*, including:

  (i) *Behavior crafting*: Identifying specific behaviors that match you, and figuring out when/how to add new habits effectively;

  (ii) *Self-insight*: Becoming clearer on your goals and aspirations;

  (iii) *Change process*: Learning how to push yourself forward;

  (iv) *Context*: Learning to design your environmental cues; and

  (v) *Mindset*: Learning to approach change with curiosity, flexibility and patience, celebrate every success, and embrace a new identity.

Untangling Unwanted Habits

When we fail to break our bad habits, we tend to feel guilty and inadequate, making it even harder to change those habits. The best way to change an unwanted habit is to untangle it gradually in 3 phases, just like how you undo a knot.

- *Create new habits*. Start by forming tiny, positive habits to improve your self-identity and crowd out your bad habits.

KEY QUOTES

"Celebration is the bridge from tiny habits to big changes."

"You're a Habit Ninja, not a conformist. Find what works for you."

"Creating positive habits is the place to start, and creating tiny positive habits is the path to developing much bigger ones."

- Once you're familiar with the Behavior Model and feel confident about yourself, use the 3 elements (MAP) to *stop old habits*:

  (i) Define the general habit you want to change (e.g. stop taking sugary foods), identify your behavior options, and *choose 1 specific behavior* that's the easiest to do (e.g. stop putting sugar in your coffee).

  (ii) Remove, avoid or ignore the *prompt* for that habit (e.g. move the sugar tin away from the coffee machine to the back of your cupboard).

  (iii) If you can't get rid of the prompt, then make it *harder* to do the habit by targeting the ability chain (time, money, physical effort, mental effort, and routine). For instance, try removing all ice-cream from your fridge so you must go out to buy ice-cream just to satisfy a craving.

  (iv) If you can't remove a habit totally, work on *reducing* it instead, e.g. eat less sugary snacks instead of none.

- If the above still doesn't work, then *swap an old habit with a new one*. Whenever you encounter the prompt, adopt a different response, e.g. each time your stomach growls, reach for an apple instead of a chocolate cake.

Making Collective Changes

Behavioral change takes time. However, each positive shift will create ripple effects to improve not only your confidence, success and happiness, but also impact others around you. Fogg's approach can be summed up with 2 maxims:

- *Fogg Maxim #1*: "Help people do what they already want to do."
- *Fogg Maxim #2*: "Help people feel successful".

Our behaviors (e.g. what we eat, do or talk about) are strongly influenced by social factors.

KEY QUOTES

"We shape our families, communities, and societies through our actions. And they shape us."

- As you engage in behavioral design, consider the *social dynamics* that affect the habits you want or don't want.
- You can also design changes to help others around you, or work with others to design positive, *collective changes*.

The behavior design process can also be used for group changes.

- You could approach a group change openly as the Ringleader by sharing the process and leading others through it. Alternatively, you can approach it like a *Ninja* by using behavioral design to subtly influence changes without others' awareness.
- Go through all *7 steps*:

(i) Clarify your aspirations together. Even if you're operating in Ninja mode, you can still ask clarifying questions like, "Can I confirm if this is our objective?"

(ii) Explore behavior options together, or ask subtle questions in Ninja mode (e.g. "What do you want to see happen?")

(iii) Match the group with their Golden Behavior.

(iv) Make the Golden Behavior easy for everyone to do.

(v) Find a way to prompt the Golden Behavior with PAC.

(vi) Celebrate success.

(vii) Troubleshoot and iterate together.

Getting Started

Tiny Habits allow you to pick virtually any behavior, make it tiny and incorporate it into your daily routine.

- If you're still unsure where to begin, Fogg recommends starting with the *3-second Maui Habit*: Once you wake up and step out of bed, say "It's going to be a great day!" This creates a subtle shift to generate rippling effects throughout your day.
- You can also try the numerous *exercises and ABC recipes* in Fogg's book.

KEY QUOTES

"Behavior Design is...about becoming the person you want to be—and creating the kind of family, team, community, and world we want to live in."

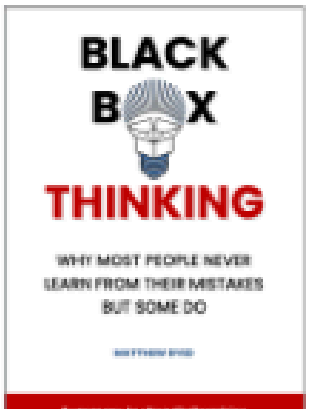
Other Details in the Book to Look out For

In the book, Fogg presents many examples, exercises, and illustrations of his behavior design models, methods, and insights. He shares a wide range of stories about behavioral change, from flossing one's teeth, to multiplying one's income, to reducing stress in a hospital. The book also includes appendices with a script for teaching the Fogg Behavioral Model, flowcharts for the 3 phases of untangling unwanted behaviors, 32 ways to frame success, 100 ways to celebrate, and 300 tiny habit recipes to tackle different types of challenges. For more details and resources, please visit https://tinyhabits.com/.

About the Author

Brian Jeffrey Fogg (born 1963) is an American social scientist and author. He's a research associate and adjunct professor at Stanford University, and the founder and director of the Behavior Design Lab. He has published several papers, authored/co-authored several books. For more details please visit www.bjfogg.com.

KEY QUOTES



BLACK BOX THINKING

Why Most People Never Learn from Their Mistakes—But Some Do

MATTHEW SYED

The Big "So What"

Everyone makes mistakes. It's how you respond to those mistakes that'll determine whether you succeed or fail in the long term. Specifically, your ability to learn from failures decides whether you repeat the same errors or use them as building blocks to move toward success. This book explains how to harness the power of failure to grow, improve and succeed.

Introduction

To learn from failures, you need the right systems and mindsets. This is exemplified by the aviation industry and its progressive approach to failures:

- There're *2 black boxes* on an aircraft: one that records mechanical information (e.g. fuel levels), and another that records sounds in the cockpit (including the pilots' conversations). During accident investigations, these black boxes provide holistic, unbiased information to uncover what happened, so corrective measures can be taken to prevent future accidents.

- Pilots are typically rewarded (not penalized) for reporting mistakes. Accidents are investigated in depth and insights are shared throughout the industry to facilitate *learning and improvement*.

In this book, Syed examines case studies from many domains and industries—from healthcare to aviation, non-profits and sports—to show why some people/organizations fail to learn from mistakes while others use them to improve and succeed. In this summary, we've organized the key ideas in 2 parts:

KEY QUOTES

"If we wish to fulfill our potential as individuals and organizations, we must redefine failure."

"Learning from mistakes relies on two components: first, you need to have the right kind of system—one that harnesses errors as a means of driving progress; and second, you need a mindset that enables such a system to flourish."

- Why we must redefine failures; and
- How to learn from mistakes.

Part 1: Redefining Failures

Why We Avoid and Deny Failure

In any society, there's a tendency to avoid failures, especially when our self-image and professionalism are at stake.

Cognitive dissonance. We feel conflicted when our beliefs or self-image are threatened by our failures. In such cases, we can either (i) accept our mistakes, re-evaluate and adjust our thinking/actions, or (ii) try to protect our ego by denying the error and twisting the facts. Most people tend to adopt the latter. Research shows that we may even erase such failures from our memory. The greater our personal stakes, the more likely we'll experience failure-denial. That is why professionals (whose self-identity and image are strongly tied to their work) often find it hard to admit to their mistakes.

- In 1987, Jimmy Bromgard was convicted of rape and sentenced to prison for 40 years. 13 years later, new DNA tests proved that the crime scene DNA did *not* match Bromgard's, i.e. he had been wrongly convicted. The prosecutor for the case refused to accept the new evidence, since it'd mean that he had made a huge professional mistake in the past. Instead, he came up with many reasons to refute the DNA results, including absurd alternatives (e.g. Bromgard was a chimera with 2 blood types).

- In 2003, the U.S. invaded Iraq on the basis that the latter possessed weapons of mass destruction (WMD). Even when it became clear that there was no WMD in Iraq, more than half the Republicans denied the evidence and insisted that they believed the WMD had been found.

KEY QUOTES

"We cover up mistakes, not only to protect ourselves from others, but to protect us from ourselves."

"The more we have riding on our judgments, the more we are likely to manipulate any new evidence that calls them into question."

"When we are confronted with evidence that challenges our deeply held beliefs we are more likely to reframe the evidence than we are to alter our beliefs."

- In 1954, a cult claimed that the world would end in a flood on 21 Dec 1954, and an alien spaceship would arrive to save believers. Cult members quit their jobs and devoted themselves to spreading the word. When the doomsday hour passed with no flood or spaceship, the members refused to admit their mistake. Instead, they claimed that they had saved the planet with their faith, and went on to recruit even more members.

Such examples may sound ludicrous, yet we don't realize it when we ourselves are thinking and acting in the same way.

A related psychological bias is the confirmation bias: we tend to look for facts that confirm our views and filter out the rest.

- In an experiment, volunteers shared their views on capital punishment before they were given 2 reports—one with strong evidence *for* capital punishment and the other with strong evidence *against* it. After reading the reports, volunteers *stuck to their original views*—they cited only evidence from the report that supported their views and dismissed the evidence in the other report as flawed.

- The more *experience or expertise* we have in an area, the more entrenched we become in our beliefs and perspectives, and the more we resist conflicting evidence.

Anticipating and avoiding blame. We're all prone to the fundamental attribution error, i.e. we tend to assign blame to people instead of situational factors. When things go wrong, we're quick to blame others. This keeps us from considering the complexities of a situation, blocks us from identifying the real causes, leads people to hide their mistakes, and hurts those who're unfairly blamed. Everyone loses as a result.

Culture. When cognitive dissonance and blame-avoidance becomes the norm, people don't even *realize* that they're evading their errors. As a result, honest and well-meaning people may end up perpetuating the very problems they seek to solve. For example, in most hospitals, it's taboo for junior staff and nurses to speak up against senior staff and doctors. Errors are rarely disclosed because of (i) a fear of backlash, and (ii) because the medical staff genuinely don't know that they've erred. Medical errors are often

KEY QUOTES

"Intelligence and seniority when allied to cognitive dissonance and ego is one of the most formidable barriers to progress in the world today."

"The most effective cover-ups are perpetrated not by those who are covering their backs, but by those who don't even realize that they have anything to hide."

reframed as "one-off accidents" or "complications" instead of being properly examined. Thus, the same errors get repeated over and over, leading to millions of preventable deaths and tragedies.

Why We Avoid and Deny Failure

Failures tell us that there's a gap between our expectations and reality. They offer valuable information about what went wrong and how we can adjust our assumptions and approach.

There are 2 types of mistakes:

- Mistakes that occur because we *don't know the answer* (e.g. a pharmaceutical company trying to find a drug for a disease); and
- Mistakes that we make even though we *know the answer* (e.g. a surgeon forgetting a standard procedure in a surgery).

In either case, the ability to learn from mistakes is crucial for future successes.

Specifically, we can approach failures in 2 ways:

- In *closed-loop systems*, people do not learn from failures. Data from errors are ignored, and the same mistakes get repeated over and over, often unknowingly.
- In *open-loop systems*, data from failures are collected, examined and the resulting patterns/insights are translated into practical learning points to facilitate system-wide improvements.

Your approach to failure determines your outcomes. This can be seen in the contrast between the healthcare and aviation industries.

- As of 2013, there was only 1 aviation accident per 2.4 million flights for Western-built jets. On the other hand, there were so many people dying from preventable medical errors that it was equivalent of two B747 aircraft crashing daily.

KEY QUOTES

"Failure is…a signpost. It reveals a feature of our world we hadn't grasped fully and offers vital clues about how to update our models, strategies, and behaviors."

"When people don't interrogate errors, they sometimes don't even know they have made one."

- Elaine Bromiley died from brain damage after what was supposed to be a routine operation. When her husband Martin tried to find out what happened, he was told that such inquiries weren't done in healthcare, and Elaine's death was an unexpected complication that couldn't have been avoided. In reality, Elaine had trouble breathing after the anaesthesia was administered. The doctors couldn't diagnose the cause and got so preoccupied with trying to insert a tube down her airways that they didn't hear a nurse's suggestion for a tracheotomy which could've saved Elaine's life. Martin finally secured an investigation which uncovered many areas for improvement, and led to recommendations that helped save many other patients' lives.

- By contrast, the crash of American Airlines' Flight 173 in 1978 was investigated in depth as a norm in the aviation industry. This led to the development of NASA's Crew Resource Management procedure, which was tested, refined, and shared with all airlines to help improve their crew communication and crisis management skills. The number of aircraft accidents fell significantly since the 1970s, and countless lives were saved due to those new processes.

In reality, failures are essential building blocks to success.

- In any competitive sport or craft, you can only gain mastery through *repeated practice*. Football legend David Beckham started practicing kick-me-ups since he was 6 years old, trying to keep the ball in the air as long as possible. After 3 years of daily practice (and lots of trial-and-errors), his kick-me-up record increased from 5 to 2003. He then moved on to practicing free kicks, doing tens of thousands of practice kicks (and refining his techniques with each failure) to master his technique.

- However, practice is only effective with *instant feedback*, e.g. Beckham could only refine his kicks based on the results of his previous attempts. In situations with delayed feedback—e.g. radiologists diagnosing tumors or psychotherapists treating mental illnesses—it's much harder to learn what truly works.

KEY QUOTES

"Learn from the mistakes of others. You can't live long enough to make them all yourself."
—Eleanor Roosevelt

"If a culture is open and honest about mistakes, the entire system can learn from them. That is the way you gain improvements."

"This is the paradox of success: it is built upon failure."

"Feedback, when delayed, is considerably less effective in improving intuitive judgment."

- *Science* is a great example of a discipline that systematically uses mistakes to make progress. Scientists are constantly testing their theories to confirm what they know, while seeking contradicting info that can disprove their theories. For example, if you only conduct tests at low altitudes, you may conclude that water boils at 100°C. However, the statement "water always boils at 100°C" will be disproved once you conduct tests at a higher altitude.

The good news is, with the right systems and mindset, any person or organization can start to learn from mistakes.

- To reduce preventable medical errors, Dr. Kaplan introduced a Patient Safety Alerts system at Virginia Mason for the hospital staff to report mistakes. Initially, very few reports were made due to the deeply-entrenched culture.

- The wake-up call came when an old lady died in 2004 after being injected with a wrong substance. As people started to report mistakes (and were praised instead of penalized), the culture began to shift. By the time this book was published, about 1,000 alerts were reported each month, allowing errors to be addressed and prevented. For example, texts were added to color-coded wristbands after the crew realized that they didn't work for color-blind nurses. Liability insurance premiums fell 74% and by 2013, Virginia Mason was rated one of the safest hospitals in the world.

Part 2: Learning from Mistakes

Closed loops are usually sustained by (i) people hiding their mistakes, (ii) reframing/justifying their errors, and (iii) interpreting data in a biased way. In this section, we'll explain how to overcome these challenges. Specifically, black box thinking is about cultivating 2 crucial components to empower people to learn from failure:

KEY QUOTES

"By finding the places where a theory fails, we set the stage for the creation of a new, more powerful theory."

- The right systems where mistakes are used to drive progress; and
- The right mindsets to support these systems.

Developing the Right Systems

In complex environments, it's impossible to know everything, and you'll inevitably encounter failures and mistakes. Instead of pretending that you're infallible or all-knowing, acknowledge your limits and build failures into your processes. Develop sound theories/plans, then test and evolve them using real-world feedback and control groups.

Cumulative selection is about using trial-and-error to test many alternatives, weed out failed options that don't work and refine viable solutions that can work. To succeed, the lessons and insights from each round of experimentation must be passed on to the subsequent rounds.

- This mirrors Nature's *evolutionary process* where only the strongest organisms survive to pass on their genes. Unilever used this approach to fix a malfunctioning nozzle in its detergent manufacturing factory. The team mimicked the process of natural selection to randomly test 10 nozzle design variations. They then replicated the best variation for the next batch of 10 design variations. After 45 rounds of tests (and systematically discarding 449 options), they had a significantly superior nozzle design.

- This approach explains why *free market economies* are so much more efficient than centrally-planned economies. In free markets, only viable businesses survive and their models/ideas are replicated by other companies. This form of "cumulative adaptation" allows only the survival of the fittest.

To succeed, you still need strong theories and concepts. The key is to test your assumptions by seeking real-world feedback, as early and frequently as possible.

KEY QUOTES

"Evolution as a process is powerful because of its cumulative nature."

"Markets work not in spite of the many business failures that occur, but because of them."

- Technologists often use the *Lean Startup approach*. Instead of trying to build a perfect product from the onset, they create a "minimum viable product" (or MVP), test it with real customers, then use the feedback to adapt the solution until they have a commercially-viable product. This approach combines top-down theories with bottom-up inputs, using an iterative approach to test, learn and improve.

- When Steve Jobs wanted to launch *Apple's retail stores*, he started by testing the retail concept in a warehouse. It took several revamps to arrive at a viable concept. He then opened 2 stores to test and refine the concept further. Finally, after rounds of feedback and changes, Apple rolled out its proven retail concept nation-wide.

- When *Dropbox* founder Drew Houston was developing his cloud storage business concept, he started by releasing an MVP—a video demonstrating how Dropbox would work. This allowed him to test if people were interested in the concept before he even wrote a single line of code. Thereafter, he secured the funds and built the program, using iterations to incorporate users' feedback.

Data, when analyzed out of context, can be misleading. To ensure that you're interpreting data meaningfully and accurately, conduct randomized control trials (RCTs) to test the counterfactual.

- For example, if your sales increased after you changed an offer on your website, you may think that the offer worked. In reality, the spike in sales could've come from an influencer recommending your product. If you had tested your website across 2 randomized groups—1 with the old offer and 1 with the new offer—you may have found the old offer to generate even more sales.

- Scared Straight was a TV program from the '70s that exposed delinquent teens to the reality of prison life, with the goal of scaring them to stay away from crime. For decades, the program was publicized as a success, based on surveys from parents. However, a scientist did a longitudinal study to compare 2 random groups of

KEY QUOTES

"It is by getting the balance right between top-down strategy and a rigorous adaptation process that you hit the target. It is fusing what we already know, and what we can still learn."

"To leverage the power of failure, you have to be resilient and open."

delinquent youths—one that went through the program and one that didn't. The results showed that teens who went through Scared Straight were actually 28% *more* likely to commit crime than those who didn't.

- In reality, most policies and interventions are done without proper tests or control groups. They're often evaluated based on a single set of observational data, leading to biased and inaccurate conclusions. To get a more valid assessment, use RCTs to compare the effects of a change against a control group that's not subject to that change.

However, RCTs are not viable on a large scale where there're too many variables to create an effective control group. In such cases, dissect a complex problem into smaller parts.

- The *marginal gains approach* is about combining measurements (to assess your current performance) with creative ideation (to discover new ideas for improvement), then applying them in an ongoing loop. Isolate a problem or variable you can test on a small scale, collect data sets and test/iterate the incremental changes. Once you've completed a trial, move on to test other variables, or to test the same variable on a larger scale. Using this approach, you can implement small changes that add up to create massive results.

- For example, to *alleviate poverty in Africa*, you can break down the problem into smaller sub-components (education, malaria, infrastructure etc.). Then, run RCTs for 1 program at a time. A group of economists wanted to improve children's grades in impoverished parts of Africa. They did a small test by giving free textbooks to 1 group of students in Kenya but not another. When this didn't produce results, they did another test using flipcharts (again with no results). In the end, they discovered a cheap and effective solution: de-worming medication. The medicine removed parasites to boost the children's growth, energy and school attendance by 25%, thereby improving their grades.

- Sir David Brailsford used the marginal gains approach to transform the mediocre *British track cycling team* into Olympic gold medalists. He achieved this by breaking

KEY QUOTES

"Science is not just about a method...it is also about a mindset."

"Success is a complex interplay between creativity and measurement, the two operating together, the two sides of the optimization loop."

"Marginal gains, as an approach, is about having the intellectual honesty to see where you are going wrong, and delivering improvements as a result."
—Sir David Brailsford

down his big goal into smaller parts. He tested and made incremental changes to many small variables, from the cyclists' bike designs to the mattresses they slept on. These small gains added up to significantly improve the cyclists' overall performance.

- This approach is also adopted by *Formula One pit stop teams*. They start by developing high-level strategies and identifying the data points needed to test each assumption. Then, they do pit stop practice-runs, examine the data, identify missing data points to be added, and do the practice-runs again in an ongoing loop. This iterative process allows them to test their strategies while collecting multiple sets of data to deepen their understanding of the problems and possible solutions.

Developing the Right Mindsets

Problems and failures are vital ingredients for innovation. The typical creative process goes like this:

- The innovator encounters a *failure or problem*, which gives him the motivation or reason to innovate.
- He *investigates* the problem, studying it from multiple angles, exploring and rejecting many options.
- A brilliant solution or *epiphany* emerges after a gestation period, and usually involves the synthesis of seemingly-separate ideas or technologies. This typically happens in 2 scenarios:

  (i) He's in a relaxed or "switched off" state (e.g. taking a stroll or shower) instead of focusing narrowly on the problem. In this zoomed-out state, the brain is more likely to make creative associations to see new solutions.

  (ii) He's facing disagreement, critique, or contradicting info, which forces him to consider the problem from new perspectives. That's why groups with diverse backgrounds tend to be more creative.

KEY QUOTES

"If you break down a big goal into small parts, and then improve on each of them, you will gain a huge increase when you put them all together."

"Removing failure from innovation is like removing oxygen from a fire."

"Without a problem, without a failure, without a flaw, without a frustration, innovation has nothing to latch on to."

"Creativity is just connecting things."
—Steve Jobs

- The innovator must now put the idea to the test, going through rounds of *iteration* (test → fail → refine → test again) until he arrives at a viable solution.

In short, successful innovations don't happen overnight. They take months or years of research, conceptualization, marginal changes, and failures, all of which cumulate in a breakthrough. This requires discipline and persistence.

- *James Dyson* first conceived the notion of a bagless vacuum cleaner when he was struggling with a vacuum bag choked with dust. He researched and incubated the idea for 3 years before he had an epiphany—to combine a vacuum cleaner with a sawmill. Thereafter, he relentlessly created and tested >5000 prototypes before he arrived a design suitable for commercialization. Dyson certainly wasn't the first to conceive a cyclone vacuum cleaner, but he was the first to persist through many failures to create a workable model.

- Likewise, *Pixar* doesn't create blockbuster movies like "Toy Story" or "Finding Nemo" by chance. After a storyline is conceived, every frame and element is discussed, critiqued and tested. A typical film goes through >125,000 iterations before the final storyboard is delivered. There are so many changes that the final movie often ends up being totally different from the original concept.

Cultivate a growth mindset, i.e. the belief that people can change and learn from mistakes (as opposed to a fixed mindset that your skills/abilities can't be changed).

- Psychologist Carol Dweck found that children with a growth mindset saw challenges as *learning opportunities* and were more perseverant compared to those with fixed mindsets. Companies with growth mindsets were more open to collaboration and sharing mistakes, whereas those with fixed mindsets were more preoccupied with hiding mistakes and avoiding blame.

- Willpower and discipline *can* be nurtured. *The more you overcome challenges, the easier it becomes*. In an experiment, a group of students was given easy tasks that they excelled in, while another group was given harder tasks that they struggled with. When both groups were

KEY QUOTES

"Insight often requires taking a step back and seeing the big picture....But to make a creative insight work requires disciplined focus."

"Winners require innovation and discipline, the imagination to see the big picture and the focus to perceive the very small."

"We progress fastest when we face up to failure—and learn from it."

"If we interpret difficulties as indictments of who we are, rather than as pathways to progress, we will run a mile from failure."

later presented with a tough problem, the 1st group became demoralized quickly while the 2nd group embraced the challenge and even asked for more. Don't allow your self-esteem or the fear of failure to handicap you—instead, use each challenge and failure as an opportunity to grow.

To embrace mistakes, facilitate learning and growth, we must shift away from a culture of assigning/avoiding blame to a culture that's fair and transparent.

- Employees must be able to *trust* their leaders and organizational systems to evaluate mistakes fairly and transparently. Differentiate between honest mistakes and justifiable blame (e.g. negligence). Give people the room to fail and learn from mistakes.

- Create *supporting systems* to identify and report errors, collect and analyze data sets, diagnose mistakes and share corrective actions and insights.

KEY QUOTES

Putting it Together

With the right systems and mindset, we can start to transform *any* area of failure into stepping stones for success.

- In the past, the legal and criminal system was considered to be infallible. The discovery of DNA brought new evidence to suggest that hundreds of men had been wrongfully convicted of rape. The Innocence Project was founded to exonerate wrongly-convicted individuals using DNA tests. Initially, they faced strong resistance from judges, prosecutors and legal professionals who had devoted their lives to solving crime and found it hard to face their own mistakes.

- It took years for The Innocence Project to uncover numerous flaws in the legal system and present concrete improvements, ranging from eye-witnessing processes to interrogation techniques and forensic sciences. People finally began to accept that addressing mistakes didn't weaken the legal system. It actually strengthened

"Failure is simply the opportunity to begin again, this time more intelligently."
—Henry Ford

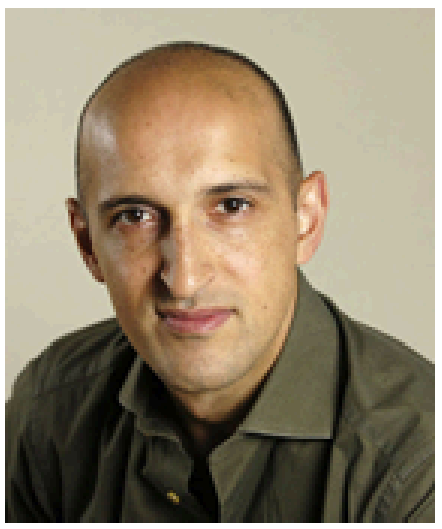
"Systems that do not engage with failure struggle to learn."

the system by ensuring that innocent people weren't wrongly convicted while guilty people didn't walk free.

Other Details in the Book to Look out For

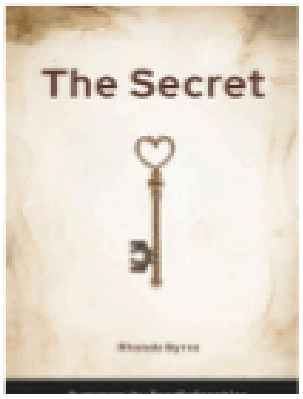
This book is full of detailed empirical research, case studies and examples about successes and failures across a wide range of domains and industries. These include: aviation, healthcare, criminology, business, sports, politics and education. For more details, please visit www.matthewsyed.co.uk.

About the Author



Matthew Philip Syed (born 1970) is a British journalist, author, broadcaster and table tennis player. Syed was the top ranked table tennis player in England for nearly 10 years. He won many titles and reached his top international ranking of 25 at the end of 1998. Syed has worked as a commentator for the BBC and Eurosport, and as a journalist for The Times since 1999. He has also published several books.

KEY QUOTES



THE SECRET

RHONDA BYRNE

THE BIG "SO WHAT"

The Secret is the Law of Attraction, which says that "like attracts like", and our thoughts create our lives. The book explains The Secret (including stories, quotes and perspectives from New Age, self-help gurus and famous personalities like Einstein, Jung and Emerson), and outlines how to apply it to achieve what we want in our lives.

UNDERSTANDING THE LAW OF ATTRACTION

Like Attracts Like

Everything in the universe is made of vibrating atoms and energy, including us. When examined under a microscope, we are masses of energy, within larger masses of energy.

Energy vibrates at specific frequencies; our thoughts are magnetic with their frequencies too. Our personal vibrations are determined by our thoughts and feelings. When we think of something, we are transmitting these frequencies to the Universe, like a human transmission tower, and they magnetically attract things of the same frequency. In short, like attracts like, and we attract things, people and circumstances that are of a similar vibration or frequency as ourselves.

We attract what we think of the most

The Law of Attraction is a law of nature. It is as impartial and

KEY QUOTES

"You are the Michelangelo of your own life. The David you are sculpting is you".
- Dr. Joe Vitale

"You become what you think about most but you also attract what you think about most".
- John Assaraf

"If you don't understand the law that doesn't mean you should reject it. You may not understand electricity, and yet you enjoy the benefits of it".
– Bob Proctor

as predictable as the law of gravity, and works regardless of whether we know or believe it. We attract what we think of the most, including:

Good and bad thoughts:

The Law of Attraction doesn't distinguish between good or bad thoughts, and it doesn't recognize whether you want or don't want something. It simply delivers what you are thinking about most persistently. Most people don't get what they want because they are focusing more on what they don't want (e.g. they don't want to be fat/ lonely), and hence end up getting more of it.

Conscious and sub-conscious thoughts:

The Law of Attraction does not only focus on conscious thoughts. You may say that you want more money, but sub-consciously feel undeserving or doubtful about your ability to earn/ attract the money – the Universe recognizes and delivers on those sub-conscious thoughts.

Shortcuts to The Secret

We have about 60,000 thoughts a day, and it's not possible to control all these thoughts. Our feelings can be used as a tool to become aware of what we are thinking, and to accelerate the manifestation of what we want.

Use feelings to identify our thoughts:

You cannot concurrently feel good and bad at the same time – if you are feeling good, you know you are holding "good thoughts", and bringing more of what makes you feel good. If you are feeling bad, you can quickly catch yourself and the underlying "bad thoughts", and shift back to the positive.

KEY QUOTES

"The law of attraction doesn't care whether you perceive something to be good or bad... (When) you feel it on every level of your being...That's what you're going to get more of."
- Bob Doyle

"The law of attraction is giving you what you are thinking about-period!"

"Our feelings are a feedback mechanism to us about whether we're on track or not, whether we're on course or off course".
- Jack Canfield

Use feelings to supercharge what you wish to attract:

When you feel something strongly, it sends out strong frequencies to attract what you are feeling. That is why what we resist tends to persist (because we give it focus and feeling, attracting more of the same).

You do not need to be worried about every negative thought that you may have, because:

Not all fleeting thoughts are manifested; what manifests most predictably are sustained thoughts that are super-charged with feelings.

Positive thoughts are much more powerful than negative thoughts, and it takes many persistent negative thoughts to bring something negative into being.

Hence, the best short-cut is to feel good, happy and positive everyday, because that will bring more good things and happiness to you.

THE CREATIVE PROCESS

To change our lives, we first change our thoughts. The power of creation is in the present, in the now, when the thought is formed and being transmitted. There are 3 key steps involved in using The Secret: Ask, Believe, Receive.

Step 1 : Ask

It is our role to get clear on what we want and the specific results we desire. If we send out mixed signals, the universe will also

KEY QUOTES

"Decide right now that you are going to think only good thoughts. At the same time, proclaim to the Universe that all your good thoughts are powerful, and that any negative thoughts are weak."

"You have the power to change anything, because you are the one who chooses your thoughts and you are the one who feels your feelings".

"Step One is simply your step to get clear about what you want. As you get clear in your mind, you have asked".

give us mixed results. Write down clearly what you want, with feeling e.g. "I am so happy that ...." If you are crystal-clear in your request, **you need to only ask or "place your order" once,** like how you place an order at a restaurant and know with certainty that it will be delivered to you.

Step 2: Believe

When you can **think, speak and act as if you are already receiving what you want,** the Law of Attraction naturally moves people, resources and events to reflect what you already believe.

Don't worry about how it will all happen, or when your desires will be fulfilled; **have complete faith that your order has been received, and allow the Universe to do its job.** Get child-like and have fun with make-believe, as if you already have what you asked for.

Step 3: Receive

Receiving is simply about feeling good, as if we have already received what we want; In so doing, we get on the right frequency to attract what we want to us.

While we need to take action, there's a difference between "action" and "inspired action". **When we act to receive, the inspired action feels so effortless and wonderful because we are on the frequency of receiving, and we are in flow with the Universe.** This is opposed to "working" against the current and struggling with our actions.

If you constantly worry about not receiving and fret over what you need to do, you are emitting signals that you are not yet ready to receive. Instead, **follow your intuition and instincts, so the Universe can magnetically guide you on the path where you will acquire all the resources you need,** be it money, people, ideas etc.

It is common for people to start feeling doubtful when they don't see immediate results. Doubts, like other thoughts, are transmitted and made real. So, **if you catch yourself with**

KEY QUOTES

"You get to choose what you want, but you must get clear about what you want. This is your work".

"Step Two is believe. Believe that it's already yours. Have what I love to call unwavering faith. Believing in the unseen".
- Lisa Nichols

"When you emit the frequency of having received it, the law of attraction moves people, events, and circumstances for you to receive."

doubtful thoughts, release them immediately and switch to the receiving mode – and know what you want is on the way.

USING THE SECRET: TIPS & PROCESSES

To use The Secret, we need to develop awareness, and manage our thoughts and feelings. Constantly check in and ask yourself: "What am I thinking? What am I feeling? Am I aware?"

To master your thoughts:

- Learn to quiet your mind, starting with 10 minutes of meditation daily.
- Set the intention "I am the master of my thoughts": say it regularly and meditate on it until it becomes a part of you who you are.

To manage your feelings:

- Learn to focus on good feelings: close your eyes and focus on positive feelings, smiling for 1 minute.
- When you feel negative, simply shift your focus to something that makes you feel good, and allow that to become your new frequency.

Powerful Processes

As we change our thoughts and feelings, the reality of our lives will also change. The book outlines several powerful processes to expedite the shift:

- Cleaning up your frequencies: At the end of every day, before you go to sleep, think through what happened in the day. If any of the events didn't go the way you wanted, recreate them in your mind in the way that makes you feel good. This helps you to clean up your frequencies for the day and emit positive frequencies the next day.

KEY QUOTES

"Receiving involves feeling the way you will feel once your desire has manifested. Feeling good now puts you on the frequency of what you want."

"It's the feeling that really creates the attraction, not just the picture or the thought".
- Jack Canfield

The power of expectation: Expectation is a powerful force. Therefore, expect what you want, not what you don't want.

The power of gratitude: Be grateful for what you have today, so you lock in that frequency and attract more of these good things. Say "thank you" hundreds of times a day, for everything that you have or is going right for you. Turbo-charge your Ask-Believe-Receive process by beginning your requests with "I am so happy and grateful for..." and give thanks in advance, as if you have already received what you want.

The power of visualization: Visualization generates thoughts and feelings, which help you to emit powerful frequencies to the universe. As you visualize, it is important to also feel the abundance, joy and gratitude that comes with having attained your desires. You can create a vision board to help you focus on what you want.

KEY QUOTES

"If you only do one thing with knowledge of The Secret, use gratitude until it becomes your way of life."

Jack Canfield summarises the creative process as such:

"Decide what you want. Believe you can have it. Believe you deserve it and believe it's possible for you. And then close your eyes every day for several minutes, and visualize having what you already want, feeling the feelings of already having it. Come out of that and focus on what you're grateful for already, and really enjoy it. Then go into your day and release it to the Universe and trust that the Universe will figure out how to manifest it."

THE SECRET IN ACTION

Using the Law of Attraction principles, Bryne touches on different aspects of our lives and how we can apply The Secret to achieve what we want.

The Secret of Your Body

To achieve your ideal weight, there are some fundamentals to note:

- The perfect weight is the weight that feels good for you.
- Don't focus on "losing weight" or you will attract more weight. Instead, focus on what you want e.g. being slim and fit.
- Know that your bodily conditions (including being overweight) is a result of your thoughts, and release your limiting beliefs. For example, food cannot cause you to put on weight unless you think it can.

Apply The Secret using the Ask-Believe-Receive creative process:

- **Ask:** Get clear on the weight you want to be at and have a clear picture of what you will look and feel like at that weight.
- **Believe:** See yourself as receiving that perfect weight, and don't contradict yourself with cues that say otherwise (e.g. don't weigh yourself, don't buy clothes at the current size etc.)
- **Receive:** Feel good about your body now as if it is already at the ideal weight.

The Secret to Money

Many people fail to attract the large amounts of money they desire because their need for money is such a powerful feeling that it continues to attract circumstances where they need money.

To attract money, you must have positive feelings about money, and focus on wealth/ the feelings that an abundance of money brings you. To achieve abundance, you need to shift your mind-space from lack-of-money to more-than-enough-money. To develop such positive feelings and beliefs about money:

KEY QUOTES

Start by using make-belief, for example:

- For the next 30 days, when you see items that you desire, consciously wipe out the thought "I can't afford that" and replace it with "I can afford that."
- Open your bills happily, by pretending the bills you are receiving are actually cheques. Or, feel great that you are receiving so much money that the amount in your bills are small by comparison.

You can also use positive affirmations daily e.g.

- "Money comes easily and frequently."
- "I have more than enough."
- "I am a money magnet."
- "I love money and money loves me."
- "I am receiving money every day."

Give money to get money:

When you give money in faith that you have more to give, the Universe will deliver more money to you accordingly. Remember to give with a joyful feeling of abundance, (rather than the feeling of sacrifice, which comes from the position of lack).

KEY QUOTES

The Secret to Relationships

The book highlights several tips to attracting the relationships we desire:

- **Love yourself:** Many of us were taught to put ourselves last, and sacrifice ourselves for the good of others, which comes from a perspective of scarcity. To get more love, we have to first fill ourselves up with love; to get more respect, we need to first respect ourselves. Ask yourself: Do you treat yourself the way you'd like others to treat you? Do you love yourself the way you want to be loved by others?

- **Love others:** Many of us constantly complain about others around us, and we wonder why we attract more of such people or circumstances. When we

radiate love – when we can see the good in everything and everyone around us – the Universe will reflect that back to us and send us all the love we want.

- **Make sure your actions are consistent with your desires:** Act as if you already have the ideal relationships you are asking for.

Mental healing is a powerful complement to medicine. The book explains how we use the Law of Attraction for better health:

The Secret to Health

- **Focus on health, not sickness:** People who are sick tend to talk about / focus on it, hence invoking the Law of Attractionfor more sickness. Rather, focus on and act as if you are completely healed/ healthy.

- **Restore our natural healing powers: Our bodies are made for self-healing** (e.g. our cells naturally regenerate, and our wounds naturally heal). Most of our diseases stem from stress, which blocks our bodies' ideal functioning. Stress in turn comes from negative thoughts. Love, gratitude and laughter are the best ways to dissolve all such negativity, and restore the body's natural healing powers.

- **Defy the aging process:** Science has also shown that our body regenerates at a very fast pace. By releasing our limiting beliefs (learned from society/ education) about our bodies and aging, we can defy conventional norms of aging.

The Secret to the World and Life

We are free to define and create our own life purpose – be guided by what makes us happy and joyful, and focus on that to get more of it. The principles of the Law of Attraction likewise applies to the world at large:

KEY QUOTES

"What you resist persists"
- Carl Jung

Focus on the cause we serve, not the obstacles in their way. What we resist gets focus, and hence persists or even grows. To move ahead positively, focus on what we want rather than what we don't want, e.g. be pro-peace (not anti-war), be pro-care (not anti-abuse).

The Universe is Abundant. The Universe is abundant and there is more than enough to fulfil everyone's need. Focusing on competition will only generate more competition. Focus on fulfilling the diverse needs in the world, and imagine the end results that we desire. We do not need to work out all the inventions or discoveries; focus on the end results and allow the Universe to bring the solutions and inventions to us.

The Universe is not limited by time or size. It is as easy for the Universe to give us $1 million as it is to give us $1. The only limitations are in our minds. To build our belief and confidence gradually, start by asking for something small, then move on to bigger items.

We are of one Universal Mind. We are all energy fields, in a larger energy field, i.e. we are all connected. Don't draw an artificial "us" versus "them boundary; Praise and bless everyone and everything, including your enemies.

The Universe is like an infinite supplier of everything; it delivers what we want through people, circumstances, and events, using the law of attraction. We order what we want through the frequencies we emit.

KEY QUOTES

"Time is just an illusion... everything is happening simultaneously ...the parallel version of you with what you want already exists!"

OTHER USEFUL POINTS ABOUT THE BOOK

Byrne was a low point in her life when her daughter gave her a copy of *The Science of Getting Rich* by Wallace Wattles. She was so fascinated by the ideas in the classic that she started to research the history of The Secret, and concluded that some of the greatest people in history (e.g. Einstein, Plato, Shakespeare, Lincoln, Newton, Hugo, Beethoven, Emerson, Edison) all knew The Secret.

She wanted to make a film about The Secret. Applying its principles, she put together a team and flew to the United States where she filmed 55 New Age "teachers"/ legends in 7 weeks (even though she didn't have a single appointment when she left for the US).

The book combines points from the film with quotes and insights from these teachers and other famous personalities like Einstein, Jung and Emerson, as well as additional points from Byrne.

ABOUT THE AUTHOR OF THE SECRET

Rhonda Byrne (born 1951) is an Australian television writer and producer, and is best known for the book and film *The Secret*. in Time Magazine's "The TIME 100: The People Who Shape Our World". She currently lives outside of Los Angeles.

Byrne began her career as a radio producer before moving into television production. In 2007, she appeared on the Oprah Winfrey Show and was featured Besides *The Secret*, she has also written book sequels *The Power*, *The Magic*, and *The Hero*. Seven Tools for Life

Arnold Schwarzenegger

The Big "So What"

This book reveals 7 critical tools to overcome challenges, stay motivated, and create a life of purpose and fulfillment. The insights are based on Arnold Schwarzenegger's personal experiences in bodybuilding, acting, politics, and public service; they're relevant whether you're at a low point in life or seeking new success.

Introduction

In this book, Arnold Schwarzenegger—politician, businessman, bodybuilder, and actor—shares his personal insights on **purpose, resilience, and growth**.

- After leaving the Governor's office in 2011, Arnold encountered *multiple personal crises*, including family issues and career challenges. Despite hitting rock bottom, he was determined to rebuild his life.

- As he worked through these challenges, recovered and transformed himself, Arnold was surprised to find others turning to him for motivation and inspiration. He realized that, despite the progress in human civilization—with less war, disease, and poverty—we're now grappling with a *social epidemic of negativity*, with a sharp rise in depression, anxiety, and addiction worldwide.

Arnold wrote this book to share his "**tool kit for life**"—a set of principles developed over 60 years of personal experience. These tools can help you to bounce back from adversity, and serve as a blueprint for living a happy, successful, and meaningful life.

KEY QUOTES

"I wrote this book because I believe that anyone can benefit from the tools I've used through every phase of my life... But most of all, I wrote it because everybody needs to be useful."

"It's the struggle that makes success, when you achieve it, taste so sweet."

"There has never been less war, less disease, less poverty, less oppression than right now...[but] so many people talk about feeling irrelevant or invisible or hopeless."

"I was face down in the mud, in a dark hole, and I had to decide whether it was worth it to clean myself up and start the slow climb out, or to just give up."

The 7 Tools for Life

1. VISION: Define Your Path with a Clear Vision

Having a clear vision means having a clear mental picture of what you want your life to look like, as well as what you don't want.

- It provides purpose and meaning, serving as a *compass for decision-making* and helping you to stay on-track toward your goals.

  (i) It helps you to make better choices by assessing which option can bring you closer to your desired future.

  (ii) It provides a sense of direction to reduce doubt and confusion.

- Without a clear vision, people often feel *lost or adrift*, finding it hard to take meaningful actions. They might feel like life is happening *to* them without control, or get stuck in jobs or routines that don't fulfill them.

Success comes from a **crystal-clear, vivid vision**, not just vague hopes.

- A vision reminds you on *what true success is and isn't* for you, helping you to prioritize long-term success over short-term gains. Once you're clear on what you truly want, you can calmly accept or reject opportunities, avoiding

KEY QUOTES

"No man is more unhappy than he who never faces adversity. For he is not permitted to prove himself."
—Seneca

"To have a clear vision is to have a picture of what you want your life to look like and a plan for how to get there. The people who feel most lost have neither of those."

"We always have a choice. What we don't always have, unless we create it, is something to measure our choices against."

"You need to get crystal clear on that vision and tattoo it to the inside of your eyelids."

distractions and "near-successes" that don't fully align with your goals. For example, in 1974, Arnold turned down a $200,000-a-year offer to be a fitness promoter because it didn't fit with his goal of breaking into Hollywood.

- *Visualize and mentally rehearse every detail* of your success. During Arnold's bodybuilding days, he imagined the exact moment of standing on the winner's podium and even the colors of his competitors' outfits.

It's not enough to just visualize your future. You must also **reflect honestly** if the person you see in the mirror aligns with who you want to become.

- Use regular self-reflection to *ensure your actions match your vision*. This is uncomfortable but necessary for growth.

There are 2 ways to **build a vision from scratch.**

- *Start small then build it out*: Focus on immediate, tangible goals and develop clarity over time.

  (i) Start with simple daily tasks you enjoy—like organizing your workspace or exercising—to create small wins.

  (ii) As you accumulate victories and build momentum, your vision will also expand and sharpen.

- *Start broad then zoom in*: Use your passions or obsessions as a rough guide, then refine your vision progressively.

  (i) For example, Arnold's vision began with "I want to be successful in America." It became clearer and more specific over time as he pursued bodybuilding, then acting, and politics.

  (ii) Many successful people, like Steven Spielberg (film) or Tiger Woods (golf), began with broad interests that later evolved into specific goals.

- Either way, it takes time to define and crystalize your vision. Here are a few steps you can use to *get started*:

  (i) Reflect on your childhood dreams or early obsessions for clues.

KEY QUOTES

"Knowing what is and isn't success brings crystal clarity to your vision. And with that clarity...comes a sense of calm, because almost every question becomes easier to answer."

"You have to check in with yourself if you want to be sure that you're moving in the right direction... You need to know whether or not your vision aligns with the reality of your choices."

"As important as it is to know what success looks like, it's equally important to know what it doesn't look like."

"Everything good, all great change, starts with a clear vision."

(ii) Set daily or weekly goals to explore those areas, using small wins to build a larger sense of purpose.

(iii) Create time and space for self-reflection, e.g. walking, exercising, or meditating to clear your mind and refine your vision.

2. AMBITION: Think Big, Act Relentlessly

Small thinking leads to small outcomes. To achieve greatness and fulfill your true potential, you must **think big** from the start.

- Don't assume you've "arrived" just because you've achieved one goal. *Keep expanding your vision* and pushing boundaries.

- For *example*, after conquering the world of bodybuilding, Arnold set his sights on the film industry. His first breaks came from action films like *Conan the Barbarian* and *The Terminator*. But he didn't stop there—he expanded into comedy, a genre many thought a muscle-bound action star couldn't succeed in, with hits like Twins and Kindergarten Cop.

Once you've committed to a goal, give it 100% and **do it right**. When Arnold took on bodybuilding, he aimed to be the best in the world, leading him to win Mr. Olympia multiple times. When he took on role of the Terminator, he trained rigorously to embody the machine-like precision that made the character so iconic.

- To truly stand out, aim to *set new records* and do what no one else has done before.

  (i) In bodybuilding, Arnold became the youngest Mr. Olympia at age 23 and won the title 7 times in total.

  (ii) In film, his movie *Terminator 2: Judgment Day* became the highest-grossing film of 1991, setting a new standard for action films and earning over $500 million globally.

  (iii) In politics, Arnold made history in 2003 by becoming the first bodybuilder and actor to be elected Governor of California during the state's unprecedented recall election.

As you pursue big goals you will inevitably encounter **naysayers**.

KEY QUOTES

"If you aim for a big goal and give it your all and you come up short, that's OK because you've still probably done something pretty impressive."

"If you're going to do it, do it... because not going all in will absolutely guarantee that you fall short."

"It's no harder to think big than it is to think small. The only hard part is giving yourself permission to think that way."

"Naysayers are a fact of life. That doesn't mean they get to have a say in your life."

- You can either *ignore them* or use their negativity as a *source of motivation* (to prove them wrong). But never believe them.

- Take *Steven Spielberg* for example. He was rejected from film school but went on to become one of the greatest filmmakers. Likewise, *Oprah Winfrey* was told early in her career that she wasn't fit for television, yet she became a media iconic.

Commit fully to your vision by **rejecting backup plans**. Having a Plan B will only dilute your focus and determination. For example, once Arnold decided to pursue acting, he rejected other career options and offers to stay focused on succeeding in Hollywood.

3. WORK ETHIC: Unlock Success Through Hard Work

Consistent, focused hard work is non-negotiable for long-term success and fulfillment.

- Hard work can be satisfying in itself, but the real purpose is to *build the foundation* so you're prepared to seize opportunities, rise to challenges, and excel in critical moments.

- You tend to appreciate an achievement much more when you've earned it. Those who take shortcuts or receive windfalls miss out on the sense of *pride and accomplishment* that comes from genuine effort—like the difference between climbing Mount Everest yourself versus being dropped at the top by helicopter.

To excel in any field, you need hours of **repeated practice**.

- Whether you're preparing for a speech, training for a competition, or mastering a craft, the key is to *do the reps, and to do them right*.

- Every top performer—from athletes to scientists—devotes time to building their skills, abilities, and confidence, so they can *perform at their best* when the critical moment arrives.

To achieve breakthroughs, you must **embrace discomfort**.

- *Accept pain as a part of growth*. In physical training, the last

KEY QUOTES

"I don't compromise. There is no plan B. Plan B is to succeed at plan A."

"If there is one unavoidable truth in this world, it's that there is no substitute for putting in the work."

"The purpose of all this hard work...is to be prepared. It's to be ready to perform when the spotlight turns on, when opportunity knocks, when the cameras roll, when a crisis arrives."

"Working your ass off is the only thing that works 100 percent of the time for 100 percent of the things worth achieving."

"Work works....No matter what you do. No matter who you are."

"Pain isn't just an indicator of sacrifice...it's also a measure of growth potential."

few reps (when pain and fatigue set in) are the ones that drive the most progress. The same applies to personal and professional growth—if you're not feeling discomfort, then you're not pushing yourself to your full potential.

- Remember: *pain is temporary*, but the satisfaction and results of pushing through it lasts far longer.

Even with the best plans and effort, unexpected challenges can still arise. That's why it's crucial to stay dedicated and **deliver on your commitments**.

- Consistency is key to make sure your ideas and efforts succeed. *Show up and follow through*, even when it's difficult. During Arnold's political career, he made it a point to personally check in on the progress of his projects to ensure things are on track and his team kept the promises made to the public. It often requires examining details that would otherwise have been overlooked.

- *Make room for your goals*. Everyone has 24 hours a day, so time is no excuse. Remove distractions and carve out time for your most important goals.
    - Do a *mental accounting* of how you spend your 24 hours. Besides time for sleep, commuting, work, and family, how are you using your time each day? What unproductive hours can you direct toward your goals? Even if you free up just 1 hour a day for your goals, that adds up to 365 hours in a year—more than enough to make significant progress!
    - When you focus on meaningful work and push your limits, you're also more likely to enter a *flow state*, where you perform at your highest level to deliver extraordinary results.

4. INFLUENCE: Sell Your Vision with Impact

To achieve your goals and dreams, you must **sell your vision**. No matter how great your idea is, it doesn't truly exist if nobody knows about it.

- Selling means *effectively communicating your vision* so

KEY QUOTES

"To do great things that last, sacrifices are necessary."

"If you want to grow, or you want to be great, it's not going to be easy. It's going to hurt a little bit. Or a lot."

"It's about leaving no stone unturned. It's about dotting your i's and crossing your t's. It's about closing the loop and circling back."

"Don't be a lazy fuck. Do the work. The only time you are allowed to use the phrase 'I took care of it is when it is done. Completely."

"What every person who gets shit done has in common is that they either find the time, make the time, or turn the time they do have into what it needs to be for them to accomplish the task in front of them."

"You can have the most amazing idea, the most fantastic plan, the best in class of virtually anything, but if nobody knows that it exists or knows what it is, then it's a waste of time and effort."

others understand its value. You need persuasive skills, whether you're pitching an idea, seeking support, or presenting yourself for a role.

To sell successfully, you must **know your audience** or "customers." These could be anyone whose support or backing you need, such as family members, colleagues, or investors.

- *Tailor your approach* based on a deep understanding of your audience's needs. For example, when transitioning to comedies, Arnold had to sell his vision to agents, producers, and studio executives who doubted his potential. He was also constantly selling his movies and himself to journalists and critics to secure favorable reviews.

Share your goals and vision with **conviction and sincerity**.

- Before you can persuade others, you must *first convince yourself*. When you believe in your own success, it's easier to bring others along. For example, Joe Weider marketed bodybuilding as if it were already a mainstream sport, even before it truly was.

- Talk about your goals *as if they're already happening*, using present-tense language to project confidence. For example, say "It is happening" or "I can see myself succeeding" rather than "I hope..." or "I will be..."

- Let others underestimate you, and then *exceed their expectations*. Arnold used this approach in the 2003 recall election. By surpassing expectations, he left a lasting impression.

- The most effective way to sell is with *authenticity*. People respond to genuine stories. When you share your personal journey or goals honestly and sincerely, you are more likely to earn trust and support. This works whether you're trying to get a promotion or persuade someone to back your project.

5. RESILIENCE: Shift Gears and Bounce Back

When pursuing ambitious goals, you will inevitably face challenges and failures. It's crucial to "**shift gears**" by quickly

KEY QUOTES

"Unless you pay attention to who is paying attention to you, it's impossible to know for sure who your vision is attracting positively or who it might be impacting negatively."

"No matter the size of your dream, you have to know how to sell it and who to sell it to...because no one is better equipped or motivated than you to sell your vision to the world."

"Nothing sells better than a true story from a genuine person. Especially when the story is about that person."

"If you can choose joy over jealousy, happiness over hate, love over resentment, positivity over negativity, then you have the tools to make the best of any situation, even one that feels like failure."

adjusting your mindset and approach, instead of dwelling on negativity, blame, or complaints.

- Human beings have a natural "*negative bias*" that leads us to focus on potential problems. It's a survival instinct to help us avoid danger, but it can also cause us to fixate on setbacks.

- To shift gears, catch any negative thoughts and *actively redirect your focus* toward lessons, opportunities, and solutions. This helps you to turn difficult situations into something productive.

- Arnold has a *no-complaint rule*: Instead of wasting mental energy on complaints, use that energy to solve problems instead. If you're not willing to take action, then the issue can't be really important to you.

    - For example, just before the filming of *Terminator: Dark Fate*, Arnold had to undergo an emergency heart surgery. Rather than blame others or allow this to derail him, he worked closely with his medical team to recover quickly within 3 months, and managed to start production on schedule.

How you respond to failure determines whether you grow or stagnate. **Reframe failure** as a stepping stone toward success.

- Failure is a natural part of the journey toward success. See it as a *source of feedback* to learn what doesn't work, so you can move closer to success.

- When facing setbacks, remember Arnold's iconic line from *The Terminator*: "*I'll be back*." Choose to bounce back stronger, and never give up.

To stand out and achieve greatness, you can't blindly follow what others are doing. Sometimes, you must **break away from convention**.

- For instance, Arnold redefined bodybuilding by focusing on a more sculpted and aesthetic physique rather than sheer size. In movies, he refused to stick to a single lane, successfully transitioning from action roles to comedies. In politics, he defied expectations by winning California's 2003 recall election as an outsider candidate.

- Remember: *Risk is manageable*, not something to be feared.

KEY QUOTES

"You work to make a dream come true, you don't whine it into existence."

"Your job is neither to avoid failure nor to seek it out. Your job is to bust your ass in pursuit of your vision...and to embrace the failure that is bound to come."

"Failure has never killed a dream; quitting kills every dream it touches."

"My entire life has been an exercise in doing things differently than they've always been done."

- Consider what you stand to lose versus what you can gain. Early in his career, Arnold had little to lose, which gave him a high tolerance for risk. As he became more successful, he learned how to *minimize the downsides* while still taking bold steps.

- Ask yourself, *"What do I have to lose?"* If you've prepared and worked hard, then failure becomes just another learning opportunity. Even when things don't go as planned, just switch gears and keep moving forward.

6. GROWTH MINDSET: Stay Open and Keep Learning

A learning mindset beats paper qualifications any day. When you **see the world as your classroom**, you can find endless opportunities for learning and growth.

- There's *no one-size-fits-all route* to success, and you don't need a college education to succeed. Many people thrive in vocational fields like real estate, plumbing, or entrepreneurship. Someone who's committed to continuous growth often outperforms a college graduate who lacks the drive.

- Mary Shenouda, the creator of *Paleochef*, is a prime example. She dropped out of college but built a thriving career as a performance chef by *learning through real-world experience*.

- *Be like a sponge*, soaking up knowledge from books, people, and life's experiences.

To learn, you need to *be curious and humble*: to truly listen, absorb and apply what you've learned.

- Successful people are often willing to share their wisdom with those who're ready to *ask good questions, listen and absorb*. Arnold's curiosity attracted many mentors and opportunities, allowing him to learn from influential figures like Joe Weider (bodybuilding), Lucille Ball (acting), and Milton Berle (business).

- Success comes from *truly listening and applying* what you learned. For example, Arnold initially wanted to play Kyle

KEY QUOTES

"The worst thing that can happen when you do the work to overcome adversity... is that you fail again and learn one more way that doesn't work.... what do you have to lose?"

"You don't know as much as you think you do, so shut your mouth and open your mind."

"It's only when you learn to soak up what those people tell you...that you truly begin to make yourself useful to others and become a resource yourself."

"Important, interesting, powerful people are drawn to those who ask good questions and listen well...They want to help you."

"Having the patience and humility to listen well is an essential ingredient of curiosity, and it's the secret to learning."

Reese in *The Terminator*, believing the hero role suited him better. However, after listening carefully to director James Cameron, he realized the Terminator character had far more potential. This decision not only boosted his career, but also taught him valuable lessons during the production process.

- Remember the *use-it-or-lose it rule*, and make sure you put the knowledge and skills into practice before they fade.

7. GIVING BACK: Break the Mirror and Serve Others

No one is truly "self-made", since every success is built upon someone else's ideas, efforts, and support. **No one succeeds alone.**

- While Arnold is often credited for his discipline and hard work, he recognizes that there are *many people behind his success*, including his parents, mentors like Joe Weider (who brought him to America), Steve Reeves and Reg Park (who inspired him in bodybuilding and movies), and John Milius (who cast him as Conan the Barbarian).

- Having benefited from others' contributions, each of us has a social responsibility to give back and help others. Arnold encourages us to "*break the mirror*"—stop focusing on ourselves and start focusing on others' needs. When you look beyond your own reflection and open yourself up to others, it also leads to deeper happiness, purpose, and growth.

Life isn't a zero-sum game. Giving doesn't reduce what you have—it benefits everyone involved and generates compounding effects.

- Real fulfillment doesn't come from personal achievements alone, but from *uplifting others and serving your community*.
  - Arnold first experienced this in the gym, where he and his fellow bodybuilders supported and pushed each other, leading to mutual improvement and advancing bodybuilding as a sport. Everyone wins in the process.
  - Similarly, the best actors are not the ones who focus only on themselves, but those who collaborate to make every scene better for everyone involved.

KEY QUOTES

"If you don't regularly flex your mind like a muscle and put your knowledge to work, it will eventually lose its power."

"We are all here thanks to the contributions of other people...recognize that you have a responsibility to give back. To help others. To send the ladder back down and lift the next group up. To pay it forward. To be useful."

"We can all grow together, get richer together, get stronger together. Everyone can win, in their own time, in their own way."

"Little things always have a tendency to become big things, and I am confident that one day something small will lead you to something big that you feel equipped to give back to in a bigger way."

- Giving back is not just a social responsibility or a way to support your goals. It also brings *happiness, fulfillment, and connection*.
    - When we help others, it triggers the release of hormones like oxytocin, endorphins, and vasopressin, which are associated with feelings of pleasure, love, and bonding. This creates the "*helper's high*" which can be addictive, motivating you to give even more.
    - A Harvard study found that giving—no matter the amount—consistently *boosts happiness*.
- Arnold started his journey with a self-focused vision but gradually shifted towards a *community-focused vision* as he recognized the power and fulfillment of giving back.

Regardless of your situation, **there are always ways to give back**.

- Try doing an *inventory of your skills and resources* to determine what you can offer—whether it's time, experience, assets like a car (to help with logistical support), or tools (to perform specific tasks).
- You can also give back through *small acts of kindness*, like helping someone with groceries, lending an ear, or offering advice. Every act creates a ripple effect, whether it impacts one person or thousands.
- Alternatively, think of what someone has done for you in the past, then *pay it forward* by doing the same for someone else.

Other Details in the Book to Look out For

The tools and principles in this book go beyond achieving personal success; they offer a roadmap for finding purpose, fulfillment, and becoming valuable to those around you. Arnold challenges readers not only to pursue their goals but to continually ask, "How can I be useful?" The book also includes actionable steps, personal stories and insights to guide you toward becoming the best version of yourself—while making a meaningful impact on others. For more details, visit beusefulbook.com.

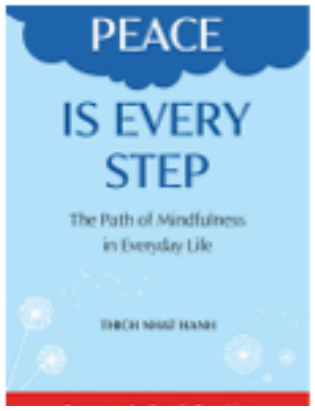
KEY QUOTES

"You can make someone's day better and your own day better with the same act of kindness and generosity. And you don't need to be rich or flush with cash to do it."

"It's not about the amount that you give, it's about the fact that you give at all. It's the act of giving that produces the increased happiness."

"In our society that is so self-absorbed, begin to look less at yourself and more at each other."

"We're all in this thing called life together. It's not a zero-sum game. It's one that can have multiple winners."



PEACE IS EVERY STEP

THE PATH OF MINDFULNESS IN EVERYDAY LIFE

Thich Nhat Hanh

The Big "So What"

In our modern life, most people are constantly worrying and chasing after new goals. We seek fulfilment, happiness and peace, not realizing that these are already in us. By slowing down and getting in touch with what's in and around us, we can bring peace and joy to ourselves and others. Nominated for the Nobel Peace Prize in 1967, Hanh shares how mindfulness can help us to manage negative feelings like anger, sorrow, and grief, and bring us true peace and happiness.

Introduction

The book is written in short chapters, organized into 3 key segments. In this summary, we'll outline:

- Key ideas and techniques for cultivating awareness and mindfulness;
- How to transform negative emotions and handle difficult psychological states; and
- How to master the art of mindful living and enjoy peace and happiness.

Cultivating Awareness & Mindfulness

We are often so busy planning for the future that we lose touch with the present. When we're not mindful, we are merely dreaming, and the people/ things around us are phantoms. When we're mindful, everything becomes real and we experience the full lushness of life.

KEY QUOTES

"Love, compassion, and altruism are the fundamental basis for peace."
- The Dalai Lama

"Peace is available in every moment, in every breath, in every step."

"Peace is present right here and now, in ourselves and in everything we do and see. The question is whether or not we are in touch with it."

"We are very good at preparing to live, but not very good at living."

Conscious breathing and smiling are 2 building blocks of mindfulness:

Conscious breathing. Breathing is an integral part of being alive. By focusing on your breathing, you bring yourself back to the present moment, and align your mind and body to focus on your breath.

Smiling. A smile can relax hundreds of muscles in your body, to bring awareness, calm and peace.

Most of us have an ongoing commentary in our heads – our minds constantly speculate and worry, and we can't switch them off. When we slow down and practice conscious breathing, we are resting our minds. We become more refreshed, and are in touch with the present moment.

Practicing Conscious Breathing

You don't need to be in a church to pray, and you don't need to be in a meditation hall to be mindful. Conscious breathing and smiling can be done anytime, anywhere.

Breathing exercises. Try these 2 simple exercises:

- *Awareness of in-breath and out-breath:* As you breathe in, say to yourself, "Breathing in, I know that I am breathing in." As you breath ut, say, "Breathing out, I know that I am breathing out.".

- *Enjoying the present:* As you breathe in, say to yourself, "Breathing in, I calm my body," and imagine cool lemonade flowing through your body on a hot day. As you breathe out, say, "Breathing out, I smile," and feel yourself relax with a smile. Spend some enjoying the moment, saying, "Dwelling in the present moment, I know this is a wonderful moment!"

Sitting Meditation. Hanh explains various postures that you can use for your meditation, including half-lotus, full-lotus, cross-legged or just sit with your back straight and your hands resting on your lap. Unlike some meditation experts, Hanh believes that you should listen to your body - if your body is numb or in pain, shift your position or take a slow, mindful walk before resuming your position.

KEY QUOTES

"Simple practices like conscious breathing and smiling are vey important. They can change our civilization."

"The source of a true smile is an awakened mind."

"Thinking is important, but quite a lot of our thinking is useless."

"We should be able to bring the practice from the meditation hall into our daily lives... Mindfulness can penetrate the activities of everyday life, each minute, each hour of our daily life, and not just be a description of something far away."

"Our appointment with life is in the present moment."

Mindfulness Cues. Hanh uses the sound of a bell to remind himself and his students to return to the present moment. You can practice this with any sound or item, e.g. each time you hear the sound of running water, or see rays of sunshine, use it as a reminder to take a break, breathe in and out, and savour the present moment.

Telephone Meditation. Our lives are somewhat controlled by our phones. We spend a lot of time on calls and messages, and they make us anxious. Before you answer or make your next phone call, pause and practice conscious breathing a few times, smiling and relaxing yourself.

Mindful Eating is an important practice, and can be very enjoyable. As a child, Hanh used to take his time to enjoy his cookies, taking as long as 30-45 minutes to savour each one. According to Hanh, even the Christian service of the Eucharist is essentially a practice of awareness - when Jesus shared his bread with his disciples, saying, "Eat this. This is my flesh", he wanted them to eat it in mindfulness.

- *Tangerine Meditation.* As you enjoy a tangerine, consider its origins, as well as those of the tangerine tree. When you look deeply into the fruit, you'll see how it contains all elements of the universe - sunshine, rain and earth, and people who delivered the tangerine to you. As you peel and enjoy the fruit, observe the mist and its fragrance, the texture and flavours of each bite.

- *Eating as a family.* Put aside everything you are doing. When the food is served, everyone breathes consciously (3x). Look at each person and give a heartfelt smile. Then, look at the food, contemplate its origins and its connection with the earth. Eat mindfully, enjoying the food and one another's presence. Focus your conversations, if any, on the food, rather than say, work problems or gossip about others.

Washing Dishes. Every we do is concurrently a means and an end. If you look at a task (e.g. washing dishes) as a chore that you have to complete to get to an outcome (clean dishes), you will dread it. But, if you wash the dishes mindfully and enjoy the moment, it becomes an end in itself.

Walking Meditation. Likewise, walking isn't just a means to get to a destination. Enjoy the walk itself, using walking

KEY QUOTES

"Practicing mindfulness enables us to become a real person. When we are a real person, we see real people around us, and life is present in all its richness."

"We must learn to stop from time to time in order to see clearly."

"When we are capable of stopping, we begin to see and, if we can see, we understand. Peace and happiness are the fruit of this process."

"Each time you look at a tangerine, you can see deeply into it. You can see everything in the universe in one tangerine."

"Breathing and smiling together is a very important practice."

"Practicing meditation is to go back to the present moment in order to encounter the flower, the blue sky, the child. Happiness is available."

"Each step we take will create a cool breeze, refreshing our body and mind. Every step makes a flower bloom under our feet."

meditation. Let go of the past/ future and just immerse in the present moment. Enjoy each step, coordinating your steps with your breathing (e.g. taking 4 slow steps with each in-breath and 4 steps with each out-breath). Notice how your feet make contact with the earth; kiss the Earth with each step, sharing your feeling of peace and contentment with it.

Driving Meditation. Driving is stressful to many people, as they get upset with traffic, red lights, and other drivers. Don't treat the car as a tool to get somewhere, but as an extension of yourself. Enjoy your drive, and treat red lights/ traffic jams as opportunities for conscious breathing, rather than obstructions to your journey. If you're driving to take a break from your problems and to release stress, consider a walking meditation instead.

Breathing Room. Hanh recommends having a breathing room in your house, where you can practice breathing and smiling. Whenever you're upset, go to the room, take time to breath, smile and recover yourself. You can place a "bell" in the room – this provides the cue for you to start your conscious breathing, and informs your family members that you're taking time to recover.

Owning the Present

Often, being present simply means to notice what's around us, without over-thinking it. Rather than do everything with a goal, learn to appreciate each moment and activity for itself. This may feel counter-intuitive in our goals-driven society. However, if you're not mindful, you may end up chasing what you already have, e.g. if you are not conscious of the happiness in you, you'll keep doing more to try to be happy. To own the future, you need to own the present moment.

Life as a masterpiece. If you try to study a flower with the goal of producing the best piece of art, you won't succeed. Instead, if you look deeply into the flower and enjoy it, the joy, peace and appreciation inside you will be expressed naturally in your art-form. In fact, it will show up in everything that you do.

Hope as an obstacle. Hope for the future makes today's hardship easier to bear, but if we focus so much on the future, we'll miss what we already have now. Rather than place all

KEY QUOTES

"When we use a car, we are ourselves and the car."

"The past is gone, the future is not yet here. If we do not go back to ourselves in the present moment, we cannot be in touch with life."

"Since we cling to our hope in the future, we do not focus our energies and capabilities on the present moment."

your energy into hoping for the future, channel it fully into the present moment, so you can create your breakthrough *now*.

Transformation and Healing

Now that we understand how to cultivate mindfulness, let's look at how to deal with difficult feelings.

Transmuting Negative Feelings

Flowers vs Waste. Most of us love flowers but despise waste/garbage. However, a flower will become waste after it wilts. Waste is made into compost, which becomes a part of the flower. They are different forms of the same thing. Likewise, we reject negative feelings and embrace positive ones, when both are a part of us.

The River of Feelings. Hanh likens our feelings to the river; each drop of water represents a different feeling. Rather than get swept away by the flood of feelings, learn to sit by the river bank and observe. Breathe consciously, recognize you have an unpleasant feeling, identify what it is (e.g. anger, fear), and face it with love and understanding (rather than rejection or clinginess).

Cooking our Potatoes. We can't eat raw potatoes, but we don't throw them away. Instead, we cook them to make them edible. Likewise, healing cannot come from running away or cutting off what we don't like about ourselves. We must learn to face them and transform them. Don't be angry with your anger. Instead, use love to nurture it, and peace to reconcile with it.

Transforming Feelings. Imagine you're feeling afraid. To transform it:

- *Identify the feeling.* Look deeply at it with mindfulness, so you can recognize it as fear.
- *Accept the feeling.* Don't detach yourself from the fear or reject it. Instead, unite with it. Use mindfulness to guide the fear, and

KEY QUOTES

"Our feeling is not separate from us or caused merely by something outside us; our feeling is us, and for the moment we are that feeling."

"If we face our unpleasant feelings with care, affection, and nonviolence, we can transform them into the kind of energy that is healthy and has the capacity to nourish us."

"Instead of acting as if we can dispose of parts of ourselves, we should learn the art of transformation."

"As soon as we understand the causes and nature of our feelings, they begin to transform themselves."

"As long as mindfulness is present, you will not drown in your fear."

realize that you're more than your fear. The more you nurture mindfulness, the stronger it'll be and the better it can keep your unpleasant feelings in check.

- *Soothe the feeling,* like how a mother will soothe an upset baby. The fear will ebb under your tender care.

- *Free the feeling.* Now that you know you can handle your fear, release it with a smile.

- *Look deeply at it.* Examine what has caused the fear, so you can address the root cause(s).

This method is comparable to psychotherapy, where the therapist works with the patient to identify the source of the pain. In both cases, the patients must be willing to free themselves of beliefs or behaviours that bring them pain.

Dealing with Anger

Mindfulness of anger. Anger and hatred can consume us and make us lose control. Yet, they are a part of us, and we need not fear nor reject them. Instead, manage them through mindfulness. When you feel angry, rather than focus on the person or issue that "made" you angry, pause to focus on your breathing, and bring in mindfulness to tend to your anger. Your priority is to calm your anger, like how a fireman puts out a fire. You should pursue the cause of the fire only *after* the flames are doused.

Pillow-pounding. Anger-management experts at times encourage people to "release" their anger through pillow-pounding. Hanh recommends against this - pillow-pounding may exhaust you briefly, but it doesn't remove the cause of anger. In fact, you're practicing how to express anger. The only way to remove anger is to look deeply into it, identify the causes, and plant new seeds to transform the situation, like how sunshine brings life to vegetation just by shining on it.

Walking meditation. When you are angry, it helps to surround yourself with nature and fresh air, while doing a walking meditation. Enjoy the environment, your breathing and steps, and calm your anger until you're ready to look deeply at it.

KEY QUOTES

"Feeling his mother's tenderness, the baby will calm down and stop crying. The mother is your mindfulness, born from the depth of your consciousness, and it will tend the feeling of pain."

"Anger...is like a blazing flame that burns up our self-control and causes us to say and do things that we regret later."

"Like a fireman, we have to pour water on the blaze first and not waste time looking for the one who set the house on fire."

"When we understand the nature, the roots, of our anger, we will be freed from it."

The roots of anger are usually pride, mistrust, desire, unrest, and/or misunderstanding (of ourselves and others). These causes arise from us, not others, i.e. no one can "make" us angry. Instead, understanding the reasons behind others' behaviours will reduce our own negative reactions.

Internal Formations

When something unpleasant happens (e.g. we feel someone has belittled us, or has treated us unfairly), a "knot" forms internally. We'll typically avoid these knots as they bring us pain. Yet, the longer the knots remain, the faster they become. It's best to untie the knots once they form, and you do that through awareness and understanding.

By observing our pain (e.g. becoming aware of the feelings, images, words etc. that we associate with something or someone), and looking deeply to understand why we respond that way, we shine a light on our deepest fears and pain. With awareness and understanding, we can begin to transform them.

Living Together. When we live with someone, our happiness are intertwined. To be happy together, we must help one another to untie the knots as they form, and to transform these internal formations.

Look into your hand. Meditate on your hands. If you look deeply into them, you can see the essence of your parents and ancestors, as well as your connection with all other elements of the universe.

Parents often unintentionally pass on their seeds of pain to their children. For example, someone who was frequently punished by his father may subconsciously feel angry, and this anger surfaces under similar situations with his own child. By practicing mindfulness, we become aware of these seeds. When we understand, forgive and transform the feelings, we bring peace and happiness to ourselves, our parents and our future generations.

KEY QUOTES

"Seeing and understanding are the elements of liberation that bring about love and compassion."

"If we do not untie our knots when they form, they will grow tighter and stronger."

"The root cause of any internal formation is a lack of understanding."

"The well is within us, and if we dig deeply in the present moment, the water will spring forth."

"We usually think that parents have to nourish their children, but sometimes the children can bring enlightenment to the parents and help transform them."

Healing with Love, Understanding and Compassion

Nourish Healthy Seeds. There are 2 layers to our consciousness – seeds, and the manifestations of these seeds. When we lose our temper, we're manifesting our anger and concurrently planting new seeds of anger. When we practice smiling and mindful breathing, we're feeling and planting new seeds of peace, joy, and mindfulness. A reservoir of healthy seeds helps us to manage negative emotions more easily.

Ask, "What's not wrong?". Avoid asking "What's Wrong?", as it invites our pain to surface. Instead, ask "What's *not* wrong?", and allow these positive elements to heal us.

Don't Blame. When a plant doesn't grow well, we look into the reasons behind it (e.g. lack of fertilizers, sunlight, water). Yet, when we face issues with people, we tend to blame them. Look after the people around you, the same way you would a plant. With love and understanding, they will flourish.

Understanding. Love and understanding are 2 sides of the same coin. When you truly understand something or someone, you will naturally feel love and compassion for them.

- *Compassion.* Having compassion means to suffer with others. Start by meditating on, or looking deeply into, someone who's undergoing physical pain or illness. Over time, you can shift your meditation to more subtle forms of suffering. When you're able to feel compassion for those who've caused you pain, and understand why they behaved that way, your negative feelings toward them will change. They'll eventually sense your shift, and reconciliation will come more naturally.

- *Love.* Like compassion, real love is built on understanding. Similar to how we accept that fire is both useful and dangerous, when we can accept people's good and bad, flowers and waste, we can be happy and peaceful together.

Hugging Meditation. Hugging can bring joy and comfort. Before you hug someone, practice conscious breathing to remove distractions. During the hug, breathe 3 times consciously to become fully present, so you can truly appreciate the person you're hugging.

KEY QUOTES

"To succeed, we need to cultivate a good reserve of refreshing seeds."

"No blame, no reasoning, no argument, just understanding."

"When you understand, you cannot help but love. And when you love, you naturally act in a way that can relieve the suffering of people."

"When we are in contact with another's suffering, a feeling of compassion is born in us."

"One word, one action, or one thought can reduce another person's suffering and bring him joy."

Bringing people together. Hanh encourages us to create opportunities for old people to spend time with, or live with their *grandchildren*, as it brings everyone great joy. He also advocates *communities of mindful living* to provide support and a sense of belonging for the practice of mindfulness.

Engaged Mindfulness

During the Vietnam war, monks and nuns had to choose between their contemplative life and stepping out to help those in need. Hanh did both, and coined the term "Engaged Buddhism". He believes that awareness through mindfulness practice isn't enough; you must also take insightful action, e.g. mindfully helping others, taking each breath and step mindfully to transmit joy and peace.

Mindful Living

As a peace activist, Hanh strongly advocates mindful living not just for personal happiness, but also to bring peace to our troubled world.

Inter-Being

Hanh uses the term "interbeing" to describe how everything is interconnected and interdependent on everything else. A piece of paper in your hand can only exist because of the tree it came from, and by extension, the sunshine, rain and earth which nourished the tree. It's also made possible by the supply chain of people, machines, transportation etc. to deliver the paper to you, and by extension, their families, raw materials etc. Even your vision and brain are needed to make the paper "real". In short, if you look deeply enough, a piece of paper "inter-is" all elements; there's nothing that's not in it.

Flowers and Waste. Earlier, we've touched on how flowers and waste inter-are. Likewise, poverty vs wealth, beauty vs vileness, are all but concepts in our head. Someone's wealth is built on another's poverty, and it's dangerous to isolate ourselves using labels and concepts. Only by seeing "inter-being" in the world can we understand how we're responsible for *everything*, good or bad.

KEY QUOTES

"We have to find ways for old and young people to live together again. It will make all of us very happy."

"Practicing mindfulness is much easier with a community."

"Once there is seeing, there must be acting. Otherwise, what is the use of seeing?"

"Practicing breathing and contemplating our body, feelings, mind, and objects of mind, we practice peace in the present moment. This is living mindfully."

"As thin as this sheet of paper is, it contains everything in the universe in it."

"The truth is that everything contains everything else. We cannot just be, we can only inter-be. We are responsible for everything that happens around us."

Non-duality. We can't understand something or someone by observing them from the outside, as separate entities. We need to become one with them. To do that, you must look deeply, and allow yourself to be lost in the thing/ person, and vice versa.

Looking Deeply. When we look deeply enough into a tree, we'll *be* the tree, and can put ourselves in its shoes. We'll see that we're made of the sun, air, rain, and everything is a part of us. If more people practiced mindfulness, we'll understand the problems in ourselves, our society and Earth, live responsibly and secure our future.

Peace is Strength. People who push hard for political, social, environmental, or other changes often burn out after repeated setbacks. By cultivating inner peace through mindfulness, we gain clarity, strength and patience to sustain consistent action.

The Art of Mindful Living

Connect with nature. We are children of Nature; Being connected to, or being one with nature, is an integral part of mindful living. We'll become aware that when we throw away an orange peel, it'll soon form part of a flower, but when we throw away a plastic bag or bottle, it takes much longer to do so. Such mindfulness will shape our choices.

Bring peace with peace. Often, peace movements are done with protests, anger and frustration, when they should involve love, understanding and compassion. To promote peace, we must first be peaceful. To achieve true peace, we need people who understand the needs and suffering of *all* parties, and can adopt non-dual views rather than take sides.

No superior side. It's easy to side with the "good people" and condemn the "bad guys". But, if we had the same upbringing and influences as a murderer, rapist, or robber, we'd likely have behaved the same way. Rather than blame others for mistakes and pain of the past (e.g. world wars, civil wars, global warming), we should treat these as compost for our flowers of the future. Hanh shares his poem "Call me by my true names", which speaks of how we are both the "good" and "bad" things around us. When we can see that all things inter-are, our hearts will be opened.

KEY QUOTES

"To comprehend something means to pick it up and be one with it. There is no other way to understand something."

"With clarity, determination, and patience – the fruits of meditation – we can sustain a life of action and be real instruments of peace."

"Real strength is not in power, money, or weapons but in deep, inner peace."

"We are imprisoned in our small selves, thinking only of the comfortable conditions for this small self, while we destroy our large self."

"Peace work means, first of all, being peace... That is why it is so important for us to practice mindfulness, to acquire the capacity to look, to see and to understand."

"During any conflict, we need people who can understand the suffering of all sides... We need links. We need communication."

"Every side is 'our side'; there is no evil side."

Citizenship. Our circumstances are defined by our perception. By changing ourselves and how we see things, we can take action based on insight. We can live responsibly, and ask the same of our leaders.

Ecology of Mind. The seeds that we plant in our minds spill over to all aspects of our lives. To stop polluting the world with violence, exploitation and chemicals, we must start by protecting our minds from the pollution of media content that sow seeds of violence, fear and anxiety in ourselves and our children.

Reconciliation

What if you'd hurt others, and they now see you as an enemy?

- First, apologize, and make a commitment to change yourself.
- Then, work on transforming yourself; that's the only way to show that you mean what you say. When you're transformed, the other person cannot help but notice the difference and will forgive you.

Likewise, you can take the initiative to reconcile with your "enemies". To practice and test your compassion, try listening to someone who has hurt you. When you no longer feel the need to take sides on the situation, can empathise with their pain, and sincerely want to ease their suffering, you're truly beginning to understand.

Other Details in the Book to Look out For

Hanh uses many powerful analogies and simple examples in this book to help us understand abstract concepts and philosophies. His peaceful essence and deep insights emanate from the book, and reading the book mindfully is in itself a calming and enriching experience.

Hanh ends the book with "The 14 Precepts of the Order of Inter being", which summarize his key teachings and philosophies. He reminds us that all concepts and ideologies, including his teachings, are merely guides, and we should discover our own truth through living fully.

KEY QUOTES

"Meditation is to look deeply into things and to see how we can change ourselves and how we can transform our situation... the situation is mind, and mind is situation."

"When you begin to see that your enemy is suffering, that is the beginning of insight. When you see in yourself the wish that the other person stop suffering, that is a sign of real love."

"If we genuinely try to understand the suffering of another person, we are more likely to act in a way that will help him overcome his suffering and confusion, and that will help all of us."

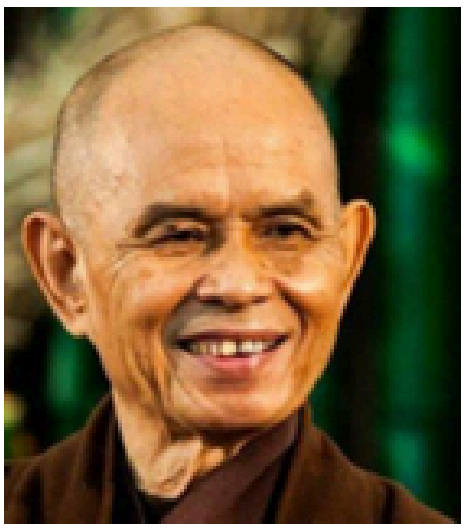
"There is nothing to chase after. We can go back to ourselves, enjoy our breathing, our smiling, ourselves, and our beautiful environment."

"All systems of thought are guiding means; they are not absolute truth."

"Truth is found in life and not merely in conceptual knowledge."

For more details about Hanh, his teachings and legacy, go to www.plumvillage.org.

About the Author

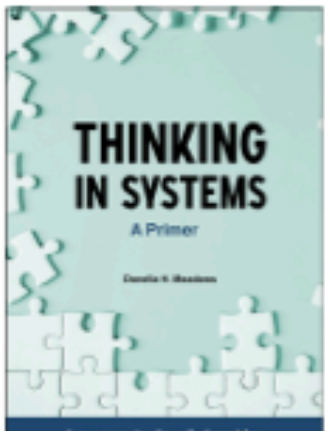


Thich Nhat Hanh (born 1926) is a global spiritual leader, poet and peace activist, known for his teachings and bestselling writings on mindfulness and peace. Hanh was ordained a Buddhist monk at the age of 16. In 1967, he was nominated by Dr. Martin Luther King Hr. for the Nobel Peace Prize, for his contributions to end the hostilities in Vietnam.

Because of his peace activism, he was exiled from Vietnam for 39 years. Hanh continued to teach, lecture and write, traveling widely to spread the message of peace and brotherhood. In 1975, he established the Sweet Potato community, which later became Plum Village, the West's largest and most active Buddhist monastery.

More recently, Hanh founded international "Wake Up" programs to train mindful living practices, opened numerous monasteries as well as Europe's first "Institute of Applied Buddhism" in Germany. He also led events for politicians (in the US, UK, Ireland, India, Thailand), and organizations like Google and The World Bank. Hanh suffered a stroke in 2014; he's still practicing in Plum Village as of 2016.

KEY QUOTES



THINKING IN SYSTEMS

A Primer

DONELLA H. MEADOWS

The Big "So What"

We live in a complex world of inter-locking systems. Systems thinking helps us to understand how things work, so we can better identify root problem causes, see new opportunities, make better decisions and adapt to changing circumstances. In this summary, we will:

- Give an overview of systems thinking concepts and principles; and
- Explain how to apply systems thinking in real-life.

Systems: Concepts and Principles

What are Systems?

Definition: A system is a set of interlinked elements that are organized to achieve a goal.

- Every animal, plant, organization and society is a complex system. A system's structure defines its *behavioral pattern*. While systems may be influenced by external forces, the *way* they respond to these forces tend to come from their inherent characteristics.
- This means that the economy will move in cycles regardless of what political leaders do. Companies that lose market share would've done so regardless of how competitors respond. Unless we can see how systems operate and create their own problems, we can't identify and address the *root causes*. We'll be like the proverbial blind men, each touching a different part of an elephant and drawing different conclusions about what an elephant is like.

KEY QUOTES

"We know a tremendous amount about how the world works, but not nearly enough."

"Systems happen all at once. They are interconnected not just in one direction, but in many directions simultaneously."

A system is more than the sum of its parts. Its elements are interrelated, e.g. the organs in your digestive system jointly break down the food you consume. Systems can be a part of larger systems, and may be able to achieve goals, evolve or even self-repair.

- *System elements* can be physical (e.g. machines, people, products) or intangible (e.g. culture, values, skillsets).

- Due to the sheer number of elements and sub-elements, it's more useful to examine the *interconnections* between elements—these may be physical (e.g. how products move through a factory) or information-based (e.g. how a customer decides to buy something).

- A system's *purpose* is the hardest to decipher—the only way to do so is to observe exactly how the system behaves. Since each sub-system has its own goals, a system can have a complex network of sub-systems and goals. For example, the students and staff in a university will have different goals from the university itself.

- Elements are the most observable but least crucial. The *greatest impact* comes from changes to the system's purpose, followed by its interconnections and elements.

KEY QUOTES

"The behavior of a system cannot be known just by knowing the elements of which the system is made."

"Purposes are deduced from behavior, not from rhetoric or stated goals."

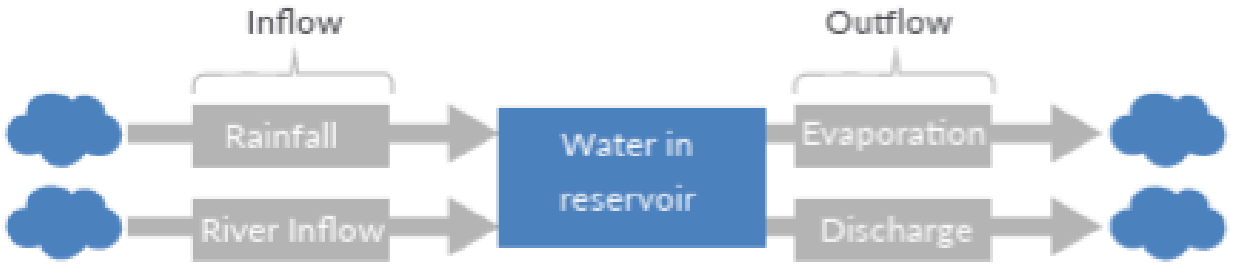
"A change in purpose changes a system profoundly, even if every element and interconnection remains the same."

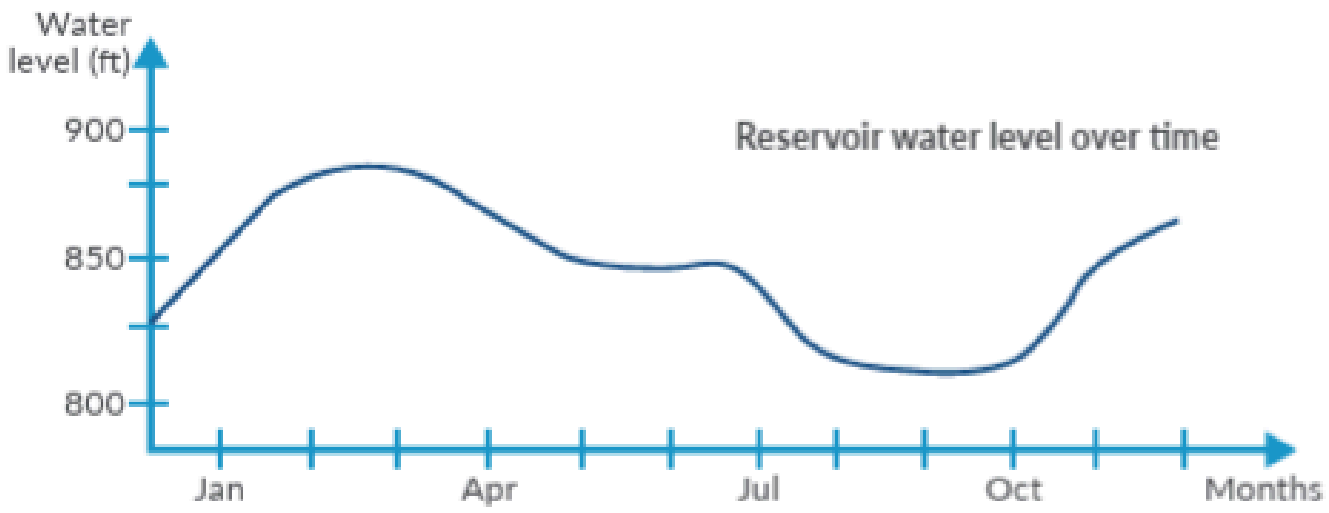
Stocks, Flows and Feedback Loops

Stocks and flows help us to understand how a system behaves.

- A *stock* is an observable or quantifiable aspect of a system, e.g. population size or inventory levels. It can be accumulated or depleted, and thus captures the history of *inflows and outflows* in the system. Stock levels rise when inflow is greater than outflow and vice versa. Stock levels stay constant and achieve dynamic equilibrium when inflow = outflow.

- The best way to understand a system is to (i) map out a *system diagram* and (ii) plot the variables/stocks on a *time graph*. For example, the simple diagram below shows the key factors that affect the water level in a reservoir. When you examine it alongside time-graphs, you can get a better grasp of how each variable affects the water levels.





- Stock levels tend to change gradually, thus providing *stability or momentum* in a system. We use stock levels to make decisions (e.g. offer discounts when there's excess inventory, spend less when the bank balance is low). Remember: flows take time and things can only happen as fast as they happen. To achieve your desired stock levels, you need to take such delays into account.

A feedback loop is formed when a change in stock affects the inflow/outflow for that stock, i.e. it triggers a process to increase, decrease or maintain the stock level. When you see a consistent pattern of behavior, there's always a feedback loop at work.

- A *balancing loop* is goal-seeking. For example, a thermostat regulates temperature—it warms up a room if it gets too cold, and cools it down if it gets too hot. Such loops bring stability but also resist change.

- A *reinforcing loop* amplifies an existing effect to trigger a virtuous or vicious cycle. For example, the more people catch a virus the faster it spreads, or the more you save the faster your bank balance grows from the compound interest. Such loops bring exponential growth but can also cause things to spin out of control and collapse.

Systems Behaviors

Just like how animals in the zoo give us a snapshot (but not the full picture) of wildlife, systems diagrams represent a simplified

KEY QUOTES

"A stock is the memory of the history of changing flows within the system."

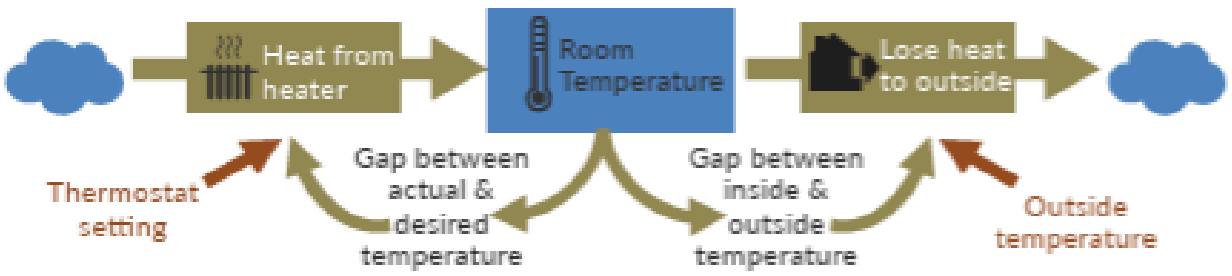
"A stock takes time to change, because flows take time to flow."

"Systems with similar feedback structures produce similar dynamic behaviors."

model of the world. Two systems that appear very different can exhibit similar patterns so long as they have similar feedback loops.

A one-stock system can have many feedback loops.

- During winter, the room temperature is affected by the thermostat setting (which controls heat released from the heater) and the outside temperature (which affects heat loss). These are *2 conflicting balancing loops* that affect the room temperature. A feedback loop can break down (e.g. if all the windows are opened to cause excessive heat loss).



- A country's population is determined by the nett effect of *a reinforcing loop (# births) and a balancing loop (# deaths)*. These are in turn driven by fertility and mortality rates. It's always easier to predict behavioral patterns than actual numbers, e.g. the exact population size could fluctuate as (i) fertility/ mortality rates change over time, (ii) a feedback loop becomes more dominant, and/or (iii) additional factors emerge (e.g. migration).

- There's always a *time lag* between something happening and the feedback loop registering it and taking corrective action. In balancing loops, a delay in 1 part of the system is likely to lead to oscillation (e.g. delay in product delivery → shop runs out of stock → perceived shortfall → place larger order → overstock). This effect, when combined with imperfect information and multiple feedback loops operating concurrently, can create massive ripples throughout a system.

A two-stock system can be much more complex, especially when 1 stock limits another stock, e.g. a mining company's money being limited by the availability of precious metals in the mines.

KEY QUOTES

"Dynamic systems studies usually are not designed to predict what will happen. Rather, they're designed to explore what would happen if a number of driving factors unfold in a range of different ways."

"We can't begin to understand the dynamic behavior of systems unless we know where and how long the delays are."

"Any real physical entity is always surrounded by and exchanging things with its environment."

- No physical entity/system can grow indefinitely—at some point, balancing loops will kick in to *limit growth*, e.g. a company can only grow insofar as it has manpower, customers, materials and resources. The nature of the constraints depend on whether the critical resources for growth are renewable or non-renewable.

- *Non-renewable stocks* are fixed in supply, e.g. once an oil field is depleted, there'll be no more oil. Your rate of extraction is only limited by your capital or resources. However, there's an inherent balancing loop in place: the faster you grow, the faster you'll drain the resources, making it progressively harder to grow until the stock is totally depleted.

- *Renewable stocks* can be living (e.g. fish or grass) or non-living (e.g. sunlight or wind), and can be regenerated through a reinforcing loop or a constant supply. They're limited by flow, i.e. they're inexhaustible so long as they're harvested at a rate slower than their rate of regeneration. However, once they're driven below a critical threshold, they can become non-renewable. For example, in overpopulated waters, fishes' rate of reproduction may improve initially if a slight decrease in fishes leaves more food for the remaining fishes. However, once the population drops beyond a critical point, reproduction plummets and the fish can become a non-renewable resource.

KEY QUOTES

"A quantity growing exponentially toward a constraint or limit reaches that limit in a surprisingly short time."

"Nonrenewable resources are stock-limited... Renewable resources are flow-limited."

Applying Systems Thinking

3 Characteristics of Effective Systems

Systems thrive with 3 key characteristics: resilience, self-organization and hierarchy.

Resilience in this book refers to elasticity, or the ability to bounce back to the original state after being strained or manipulated.

- Resilient systems are *dynamic*. A system is more resilient when (i) it has multiple feedback loops (so when 1 loop fails, another kicks in) and (ii) there's at least 1 loop that can repair other loops. The most resilient systems are those that can self-organize.

- Unfortunately, resilience is not obvious unless you have a full system perspective. We tend to *sacrifice resilience for stability or productivity*. For example, growth hormones can increase a

"Systems need to be managed not only for productivity or stability, they also need to be managed for resilience—the ability to recover from perturbation, the ability to restore or repair themselves."

cow's milk-production but reduces its long-term immunity. Pesticides kill pests, but they also kill off other species to disturb the eco-system's bio-chemistry, reduce its resilience and trigger long-term ecological disasters.

- Look beyond productivity or observable properties to consider how you can *strengthen a system's resilience* and self-regeneration capabilities. For example, instead of simply giving food and money to the needy, develop programs that increase people's ability to generate their own food and money.

Self-organization is the ability to learn, evolve and create new complex systems/structures to survive, rebuild and thrive.

- For example, the human body is developed from a single cell and constantly repairs itself. A company converts raw materials into a much more sophisticated form (e.g. a car or computer).

- Self-organization is spontaneous and unpredictable; it requires freedom and experimentation. However, complex creations are often built upon a few simple rules, like how all lifeforms are captured in a series of DNA, RNA and protein molecules.

Complex systems require hierarchies to organize the huge amounts of information/interactions and operate stably.

- For example, each cell in our body is part of an organ, which is a part of a system (e.g. digestive or reproductive system), which is a part of our human body. Each of us in turn is a part of a family, community, nation etc. Ideally, each sub-system should be able to manage itself while serving the needs of a larger system. The larger system in turn should integrate/augment the sub-systems *synergistically*.

- A system is *sub-optimal* when hierarchies don't work in sync. In such cases, imposing centralized control won't work and may even backfire. The only sustainable approach is to understand and address the needs of the sub-systems so the entire system can flourish dynamically. When hierarchies malfunction, the entire system can break down, e.g. when certain cells in the body multiply out of control and attack other cells.

KEY QUOTES

"Productivity and stability are the usual excuses for turning creative human beings into mechanical adjuncts to production processes."

"The ability to self-organize is the strongest form of system resilience. A system that can evolve can survive almost any change, by changing itself."

"Hierarchical systems evolve from the bottom up. The purpose of the upper layers of the hierarchy is to serve the purposes of the lower levels."

"When a subsystem's goals dominate at the expense of the total system's goals, the resulting behavior is called suboptimization."

Thinking in Systems

We tend to get surprised by systems because we over-estimate how much we know and under-estimate how complex systems are.

- Real-world systems are complex networks of stocks, flows, and feedback loops. Systems thinking helps us to consider the relationship between system structures, behaviors, and events. By asking what-ifs, we can *consider possible scenarios* so we're less likely to be surprised.

- Yet, in most cases, it's *impossible to accurately predict the future*. For example, there's no way to account for all the variables, relationships and events that affect economic growth or stock market indices. That's why complex modeling may still work for short-term predictions, but not for long-term forecasts.

Watch out for these thinking gaps:

- *Linear vs nonlinear relationships*. We tend to think in linear relationships (i.e. assume things run in a straight line) when most relationships are actually non-linear (i.e. there's no proportionate relationship between variables). For example, once vehicle density reaches a certain level, traffic jams get much worse.

- *Imaginary boundaries*. For simplicity, system diagrams use clouds to denote the stocks at the start/end. In reality, there's no finite start or end to a system. For instance, the earlier diagram on population size doesn't address the drivers for mortality/death rates, nor other factors that affect population size e.g. migration. It's unrealistic to try and capture *everything*—the key is to be aware that all system boundaries are imaginary.

- *Multiple constraints*. Every outcome is influenced by multiple factors, but we tend to think in terms of singular cause-effect relationships. Over time, a system's limiting factors (what's most vital for growth) will also change, e.g. a startup faces different constraints as it grows to a mid-sized firm. At some point, you must choose your limits (e.g. the maximum population size to maintain acceptable living standards), or the system will decide it for you (e.g. resource shortages, declining air quality).

KEY QUOTES

"Structure is the key to understanding not just what is happening, but why."

"The world is nonlinear. Trying to make it linear for our mathematical or administrative convenience is not usually a good idea."

"Remember that boundaries are of our own making, and that they can and should be reconsidered for each new discussion, problem, or purpose."

"Ultimately, the choice is not to grow forever but to decide what limits to live within."

- *Pervasive delays*. Things take time to happen, and there're delays in most feedback loops—delays in shipping, perception, processing etc. Mail takes time to reach the recipient and viruses take time to develop into diseases with observable symptoms. If there're long delays in the feedback loop, it'll be too late to take action when the symptoms surface, e.g. if you only start to build power plants when there're electricity shortages, you'll end up with cycles of under-capacity and over-capacity.

- *Bounded rationality*. We make the best possible decisions based on what we know to satisfy a current need. However, we (i) won't have perfect information, (ii) can't see all options, viewpoints or implications, and (iii) will always interpret info subjectively. Thus, a sound decision that meets a personal short-term goal can create long-term problems for ourselves and others. The best way to get a bigger picture is to experience the system from a different position, e.g. an activist going to work for the government body he's been campaigning against. Each shift gives you a wider system perspective to make better decisions.

Identifying System Traps and Opportunities

Learn to recognize the "behavior archetypes" or system structures behind common problems, so you can deliberately restructure them to fix the problems at cause.

Resistance to change. Balancing feedback loops can sustain behavioral patterns to make them change-resistant.

- In 1967, the Romanian government tried to increase birth rates by making abortions illegal for women under 45 years old. There was a temporary spike in birth rate, then people turned to illegal abortions or abandoned the children they couldn't afford to raise. So long as the sub-systems have different goals with players pulling in different directions, there'll be *policy resistance*. The harder 1 player pushes an outcome, the harder the other players in the balancing loop will resist.

- A better approach is to step back, identify all the players' goals and how to incentivize them to move in the desired direction. For example, to increase birth rates, you need to know why people aren't having more children. In the 1930s, Sweden's birth rate was declining. Instead of trying to forcibly increase family sizes,

KEY QUOTES

"To act only when a problem becomes obvious is to miss an important opportunity to solve the problem."

"Change comes first from stepping outside the limited information that can be seen from any single place in the system and getting an overview."

"The most effective way of dealing with policy resistance is to find a way of aligning the various goals of the subsystems, usually by providing an overarching goal that allows all actors to break out of their bounded rationality."

the Swedish government rallied the country behind the *common goal* of improving the quality of child care so every child is wanted and nurtured.

The "tragedy of the commons" comes about when a shared stock is eroded or destroyed because people exploit more and more of the stock instead of conserving it.

- Such problems arise in any *common resource* (e.g. public parks, common toilets) where users benefit directly from the stock, but share the cost of stock depletion. For example, a farmer can directly use every tree he cuts down, whereas the costs of deforestation is shared with everyone else. The more users there are, the scarcer the resource and the more people rush to consume it before it's depleted.

- *Solutions* include: (i) educating people on the implications of uncontrolled usage and appeal to their good sense, (ii) privatizing/splitting the resource so people are accountable for their own usage and (iii) using regulations (e.g. taxes, quotas, permits) to limit consumption. Paid parking lots, traffic lights, broadcasting licenses etc. are all examples of ways to manage the commons.

Systems may experience sliding standards or a "drift to low performance" if (i) the players perceive things to be worse than they are, and (ii) such perceptions affect their future targets.

- For example, you may accept lower-than-desired air quality because it doesn't seem any worse than before. The new (lower) standard becomes the norm and the *negative loop* continues.

- *Solutions* include: (i) sticking to absolute goals (vs being influenced by past/existing performance) or (ii) benchmarking only against the best historical performance.

Escalation arises when competing players try to outdo one another in a reinforcing loop, e.g. price war, shouting match, weapons race.

- Even escalation for positive things (e.g. efficiency, morality) can become negative when taken to the extreme. If left unchecked, it usually ends up with at least 1 of the players *collapsing*.

KEY QUOTES

"The tragedy of the commons arises from missing (or too long delayed) feedback from the resource to the growth of the users of that resource."

"Standards aren't absolute. When perceived performance slips, the goal is allowed to slip."

- *Solutions* include: (i) one party taking the first steps to unilaterally reduce the stocks (and stop the reinforcing loop) or (ii) negotiating balancing loops that can keep escalations in check.

Widening winner-loser gaps occur when winners get rewarded with resources that help them to win even bigger in future. This creates a reinforcing loop that could eliminate losers from the system, e.g. the rich using their wealth and access to gain even more wealth and access.

- *Solutions* include: (i) Diversification (e.g. a company moving to a new niche to exploit new resources), (ii) adding balancing loops to prevent domination (e.g. antitrust laws) or equalize the playing field (e.g. handicaps for weaker players), and (iii) finding ways to break the reinforcing loop (e.g. progressive taxes, public welfare).

Addictions. Just like how people can get addicted to alcohol or drugs, players in a system can get addicted to a solution that eases problem symptoms without addressing the root causes.

- Such interventions are usually introduced to boost a stock. However, if the root cause isn't addressed, problems will resurface and demand an even bigger fix. Worse still, the intervention could cause a *degeneration of the original system capabilities*, and shift the burden increasingly to the intervener. For example, kids' reliance on calculators can reduce their capacity for mental arithmetic, and the use of pesticides can destroy the pests' natural predators so farmers need to use even more pesticides.

- *Solutions* include: (i) withdrawing from the addiction (gradually or going cold-turkey), or (ii) avoiding it from the onset by strengthening the system's abilities instead of taking on its burdens.

In any system, there'll be people trying to break the rules, i.e. they seem to be following the rules but are actually working around them, e.g. drivers keeping to the speed limit only when there're speed cameras or police cars. Use rule-beating as a form of feedback to refine the rules, or design rules that specifically incentivize people to self-organize in the desired way.

KEY QUOTES

"Addiction is finding a quick and dirty solution to the symptom of the problem, which prevents or distracts one from the harder and longerterm task of solving the real problem."

"The secret is to begin not with a heroic takeover, but with a series of questions."

"Wherever there are rules, there is likely to be rule beating."

"Systems…have a terrible tendency to produce exactly and only what you ask them to produce. Be careful what you ask them to produce."

Systems will deliver whatever they're designed to deliver—if you set the wrong goals, you'll get disastrous outcomes. For example, an education system will deliver vastly different outcomes depending on whether you measure "good education" using expenditure or test results. Don't confuse efforts with results.

Creating Effective System Changes

The best way to change a system is to (i) identify the leverage points where a tiny shift could trigger a large change in behavior, then (ii) figure out the right direction to push. This is a difficult process that requires hard work and an open mind (to explore new ideas and options).

Use these leverage points in order of impact:

- Every system or society comes with its own *paradigm*, i.e. a set of unspoken assumptions and beliefs (about what's good, right, fair, etc.). Paradigm shifts can be achieved in any system with the right reinforcements and change agents. However, the ultimate leverage comes from *transcending* paradigms, i.e. realizing that there's no single "right" or "true" paradigm.

- A system's *goals* define its behaviors. Most systems (including cancer cells) seek to survive and grow. The key is to deliberately choose how far to grow and to what end, so we prevent 1 system's unchecked growth from destroying others.

- Increase a system's *self-organization* abilities so it can change dynamically. The best way to do so is to promote learning and evolution through diversity and experimentation.

- Use *rules*—including rewards, penalties and constraints—to directly shape behavior.

- Typically, system players will organize themselves with the right info. Design *information flows* to incentivize players to act in the desired way, e.g. show the increasing cost per unit to discourage people from consuming too much of a limited resource.

- Build in checks and balances to curb the momentum of *reinforcing feedback loops* to prevent long-term system collapse.

KEY QUOTES

"There are no cheap tickets to mastery. You have to work hard at it."

"If no paradigm is right, you can choose whatever one will help to achieve your purpose. If you have no idea where to get a purpose, you can listen to the universe."

"Missing information flows is one of the most common causes of system malfunction."

- A complex system comes with many *balancing feedback loops*, each designed to maintain a sub-goal and jointly define the overall system strength. Ensure that each balancing loop is strong enough relative to the impact it's designed to achieve, e.g. governments can only manage big industry players if they have enough power. Be careful when removing balancing loops e.g. an emergency cooling system may seem unimportant since it's usually inactive, yet its removal will weaken the system.

- Adjust the *length of delays* in feedback loops (where possible) to influence system behaviors and the level of oscillations.

- A system's behaviors are determined by the *structure* of stocks, flows and their interconnection. Your best leverage is to design a great system from the onset, since it's hard to change a system once it's built. You can only improve existing systems by addressing the bottlenecks and limiting factors.

- Build stocks that are big relative to the flows, so they can act as a *buffer* to stabilize the system, e.g. a lake is much less likely to overflow than a bathtub.

- *Numbers* seldom result in real change (e.g. tweaking minimum wages or tax rates won't restructure the economy), unless the change is big enough to trigger other leverage points above.

Conclusion

Ultimately, it's impossible to fully understand dynamic, self-organizing, nonlinear systems, much less predict or control them. The real value of systems thinking is in helping us to understand the complexity of the world we live in, so we can manage our expectations, learn from surprises, and actively design/refine systems and find creative ways to bring our visions to life.

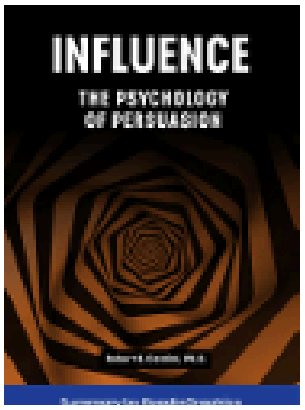
The book is packed with examples and diagrams (ranging from business to sociology and economics) to help us understand systems at work. Meadows also presents several rules of thumb to help us navigate more effectively in a world of systems. For more details, please visit academyforchange.org.

KEY QUOTES

"The only way to fix a system that is laid out poorly is to rebuild it, if you can."

"The future can't be predicted, but it can be envisioned and brought lovingly into being."

"The thing to do, when you don't know, is not to bluff and not to freeze, but to learn."



INFLUENCE

The Psychology of Persuasion

ROBERT B. CIALDINI, PH.D

The Big "So What"

Based on years of research, Cialdini discovered 6 key principles of persuasion which lead people to say "yes" automatically. Understanding these principles and associated techniques can help you to improve your influence and concurrently guard against others' manipulation.

Introduction

Fixed-action patterns. Both animals and humans have certain behaviors that are pre-programmed and activated once specific cues are triggered.

- Such patterns are essential for our survival. There are simply too many environmental stimuli for our brains to process everything. Using specific cues as *shortcuts*, we can react quickly without processing all the information. For example, a flash of sharp teeth or blade will signify "danger", causing us to step back instinctively without second thought.

- The same *predictable patterns* are behind animals' mating rituals and defence mechanisms. A mother turkey will care lovingly for a chick that makes a "cheep-cheep" sound (a good indicator that the chick is healthy), but will ignore or even kill a chick that doesn't chirp. The "cheep-cheep" sound is so powerful that the turkey will even care for a predator-shaped stuffed toy if it makes the sound.

In short, we tend to respond in an mechanical, predictable way to certain triggers or stimuli. With the right cues, we'll **say "yes" automatically** without conscious thought.

KEY QUOTES

"We must very often use our stereotypes, our rules of thumb to classify things according to a few features and then to respond mindlessly when one or another of these trigger features is present."

"Fixed-action patterns...occur in virtually the same fashion and in the same order every time."

- For example, you're more likely to comply to a request if the other party offers a reason using the word "*because*". You'll also estimate how good/heavy/valuable something is, just by comparing it with something you've just seen (the "*contrast principle*").

- We fall back on such shortcuts more when we're tired, stressed, distracted or rushed. With technological advancement, a faster pace of life and information-overload, we've become *increasingly reliant* on this primal way of making quick decisions.

After many years of research, Cialdini discovered 6 key **weapons of influence**, each built on a psychological principle of persuasion.

- Underlying all 6 principles is "*material self-interest*", i.e. everyone wants to pay the least, yet get the most.

- Each principle can be used to *bring positive change or deceive others*, depending on the intention of the user. Being aware of these weapons allow us to guard against "compliance professionals" (e.g. salespeople or marketers) who specialize in getting people to comply with their requests.

The 6 Principles of Persuasion

Reciprocity

When someone does something for us or gives us something, we feel obliged to repay in kind.

The **Reciprocity Principle** is a vital part of human society:

- It makes it less risky for people to offer help or goodwill to others; it facilitates sharing and cooperation which supports mankind's *social advancement*.

- You'll feel *indebted to repay a favor* even if you don't like the person.

KEY QUOTES

"We have created an environment so complex, fast-paced, and information laden that we must increasingly deal with it in the fashion of the animals we long ago transcended."

"A favor is to be met with another favor; it is not to be met with neglect, and certainly not with attack."

Reciprocity has been **widely tested and applied** in various settings:

- In an *experiment*, a man intentionally gave a free bottle of Coca-Cola to some participants but not others. Those who received the free drink later bought twice as many number of raffle tickets from the man as a favor, compared with those who didn't.

- In *sales*, free samples are commonly used to trigger the reciprocity principle and let customers try the product. It's also proven that you're more likely to get a *donation* if you give someone a small gift first.

- Reciprocity even works in *politics and war*. During World War I, a soldier was released after he shared his only piece of bread with the enemy who had captured him.

When you receive a concession, you'll also feel obliged to give a concession. There are **2 related compliance techniques** built on this principle: "reject-then-retreat" and "large-then-small".

- Basically, the other party starts with a larger request (e.g. present an item for $20). If you reject the request, he/she makes a smaller request (e.g. present a less valuable item for $5). In this case, you're *likely to agree the 2nd request* because (a) the requesting party seems to have made a concession, which triggers you to give a concession by switching from "no" to "yes" and (b) by perceptual contrast, the 2nd request seems smaller.

- The larger the initial request (within reasonable limits), the bigger the concession seems. The *requester wins by default*—if we accept the initial request, he/she gets a better deal; if we only accept the 2nd request, they still get a deal.

Interestingly, the receiving party doesn't usually feel cheated and even **responds positively.** Such techniques have been found to (a) increase the chance of *getting* an agreement, (b) increase the chance of the agreement being *fulfilled*, and (c) increase the *satisfaction level* of the receiving party. This is because:

- When we believe someone gave us a concession, we feel *responsible* for the outcome and tend to honor it.

KEY QUOTES

"A person who feels responsible for the terms of a contract will be more likely to live up to the contract."

- We also tend to feel more *satisfied* with the arrangement, and are hence more likely to repeat it in the future.

⚠ However, this principle can also be **used against us**.

- *Unsolicited debts*. We may be pressured to accept something that we don't want or dislike, yet feel compelled to repay it. For example, you may grudgingly accept a snack that someone bought for you, then later find yourself cornered to return the favor, resulting in a lose-lose situation. Or, you may receive an uninvited gift in the mail with a request for donation.

- *Unfair exchanges*. A small gift or favor may be used to trigger a much larger favor or purchase in return.

How to say no. It doesn't make sense to reject all favors, gifts and concessions, since many are genuine and benefit us. The key here is to identify the true intention of the requester.

- Start by *accepting the favor or gift* offered to you.

- If the person starts to make demands/requests after that, simply *redefine the situation mentally*. Recognize that it's not a real favor or concession, but a persuasive manoeuvre—this frees you from your sense of obligation and makes it easier to say "no".

Consistency

Once we take a stand or make a choice, we feel compelled to behave consistently with our earlier commitment, and to justify our own decisions so we feel better about them. This need to appear consistent (to ourselves and others) can make us act contrary to our best interest.

Consistency is an **important motivator** because:

- Most *cultures* value personal consistency. Consistency is associated with clarity, reliability or honesty, while inconsistency is associated with indecision, confusion or deceit.

KEY QUOTES

"Another person can trigger a feeling of indebtedness by doing us an uninvited favor."

"The rule says that favors are to be met with favors; it does not require that tricks be met with favors."

"We all fool ourselves from time to time in order to keep our thoughts and beliefs consistent with what we have already done or decided."

- It provides a mental shortcut to *minimize the amount of thinking required*—once we've decided on something, it's easier to use it to guide future decisions.

- It also allows us to *avoid difficult realities* that we'd rather not deal with, e.g. we may prefer to believe that our current solutions will work, rather than find alternatives to a tough challenge.

For the consistency principle to kick in, **a real commitment** must be made, with a fundamental shift in self-image. This involves several components.

- *Active*. When you actively do something in support of a position or decision, you become more committed to it. A written statement can be very powerful as it makes the person's views visible/concrete, and can be shown to others.

- *Public*. The more public your stand, the more reluctant you'll be to change it, for fear of appearing inconsistent. In a study, students were asked to make choices before being given conflicting data. Those who wrote down and signed next to their choices were the most unwilling to change their views, while those who didn't write down their choices were most willing to change them.

- *Effortful*. The more effort you've put into your choice, the more you will value and justify it. This is why tough initiation programs are so popular in tribal and fraternal societies—the more people have endure to secure their membership, the more they're committed to it.

- *Inner choice*. When we choose something without strong external pressures (i.e. huge rewards or huge threats), we feel more ownership of that decision and will stick to it willingly. However, if we believe that we did something just to get a reward or to avoid a threat, our fundamental self-image is unchanged and we'll drop these behaviors once the reward or threat is removed.

Once a firm commitment is made, there'll be **lasting changes** to our choices and behaviors. The commitment "grows legs" as we find new ways to justify it and make new choices in various situations to stay consistent.

KEY QUOTES

"There are certain disturbing things we simply would rather not realize... automatic consistency can supply a safe hiding place from those troubling realizations."

"Our best evidence of what people truly feel and believe comes less from their words than from their deeds."

"It appears that commitments are most effective in changing a person's self-image and future behavior when they are active, public and effortful."

"We accept inner responsibility for a behavior when we think we have chosen to perform it in the absence of strong outside pressures."

Unfortunately, **blind consistency** is often used against us.

- In *retail*, toy manufacturers may advertise certain toys during the Christmas season but understock them. Parents find themselves buying substitutes during Christmas, then getting another set of the originally-intended toys when they're are back in stock after Christmas—just to keep their promises to the kids.

- A common *sales strategy* is to secure a small (even loss-making) purchase, then use it to open the door for bigger sales. A deceitful salesperson may even offer an artificially low price, secure your commitment (with paperwork, trial runs etc.) before revealing at the last minute that there had been a mistake in the calculation or an omission.

- Organizations soliciting *donations* may use surveys to ask if you'd be willing to help collect funds for charitable organizations, or use pleasantries to get you to agree that you're feeling great. To stay consistent with your responses, you're more likely to agree later to contribute to the less fortunate.

- During the *Korean War*, many American soldiers were captured as prisoners-of-war (POWs) by the Chinese communists and successfully "converted" using the consistency principle. The Chinese initially got the POWs to make small, seemingly harmless statements like "The United States is not perfect", then progressively got them to make bigger commitments (e.g. listing down problems in America and even writing essays on them).

How to say no. The best way to avoid being manipulated is to become aware of it *before* we make a commitment.

- If you feel unsure about a situation, *pause and ask*, "Knowing what I know now, if I could go back in time, would I still make the same choice?".

- Then, pay attention to the first *gut-impression* that comes to you, before your logic kicks in. If your gut feel is one of discomfort or uncertainty, put aside your inclination to stick to past commitments and take time to review the facts.

KEY QUOTES

"When it occurs unthinkingly, consistency can be disastrous."

Social Proof

When we're uncertain how to behave or react, we look to others for answers.

Generally, this **rule-of-thumb** is useful for quickly figuring out norms or acceptable behaviors. We assume that if lots of people are doing something, it must be correct.

This principle is being **applied widely** in our daily lives.

- For *example*, TV-shows and comedies use canned laughter because it's proven to make the audience laugh more and works even for lousy jokes. Clubs create artificially long queues to give the impression that they are packed. Advertisers use "fastest-growing" or "best-selling" to signal that certain products are popular. Tip jars and donation boxes filled with some money tend to encourage people to tip or donate more.

- This principle is the most powerful when we are emulating the behavior of *people who are similar to us*. That's why many testimonials feature the average-person-on-the-street.

- Social proof can even help to *overcome phobias*—children who were afraid of dogs overcame their fear after repeatedly watching a video of a child happily playing with a dog. The clips were more effective if they showed a variety of children playing with dogs.

"**Pluralistic ignorance**" is a phenomenon where a large group of people go along with something they personally disagree with, but incorrectly assume is acceptable because others also do it. In a tragic incident, a woman was attacked near her house for more than 30min and eventually killed with multiple stab wounds. 38 people watched the attack from their own homes, yet no one called for help until the woman was dead.

- *This happened because*: (a) when there are many people around, everyone assumes someone else will help, so no one takes action, and (b) when people around us seem calm and unflustered, we infer that the situation cannot be an emergency.

KEY QUOTES

"In general, when we are unsure of ourselves, when the situation is unclear or ambiguous, when uncertainty reigns, we are most likely to look to and accept the actions of others as correct."

"We will use the actions of others to decide on proper behavior for ourselves, especially when we view those others as similar to ourselves."

- Pluralistic ignorance is most common in *a large group of strangers*, who try to look poised and dignified in front of others. It's thus likely to occur in urban settings, which are confusing, populous, with people who are less familiar with one another.

- If you're ever caught in an emergency, the *best strategy* to get help is to (a) be clear and specific about the help you need and (b) assign 1 person in the crowd to take action, e.g. "You, sir, in the blue shirt. I'm having a heart attack. I need help. Call the ambulance now."

This copycat behavior or herd instinct is so strong that it can even extend to **aggression and suicide.**

- After news coverage of a black fighter losing a heavyweight championship, there was a marked increase in the *homicide* rate for young black victims (but not white victims) in the next 10 days. Likewise, when a white fighter lost a match, more young white men (but not black men) were killed in the next 10 days.

- More than 2 centuries ago, a German novel (in which the hero committed suicide) was banned after the story triggered a wave of *suicides* in Europe. Today, front-page suicide stories are usually followed by a spike in deadly accidents (which Cialdini believes are suicides masked as accidents so insurance payouts won't be forfeited). In fact, the profiles of drivers in the accidents match those of the news coverage. News articles about a young person's suicide are followed by a surge of accidents involving young drivers, while news about an older person's suicide are followed by a surge of accidents involving older drivers.

How to say no. It's useful to learn from others so long as the feedback is valid and valuable to us. Beware 2 types of social proof:

- *Intentionally-falsified social evidence,* e.g. fictitious testimonials, bogus statistics. Cialdini urges us to expose and take strong action against such tricksters so they can't continue to deceive others.

KEY QUOTES

"Your best strategy when in need of emergency help is to reduce the uncertainties of whose around you concerning your condition and their responsibilities."

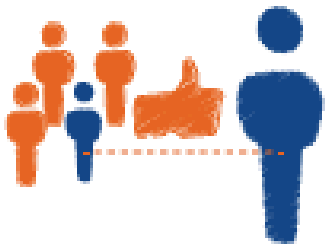
"The mentality of a herd makes it easy to manage. Simply get some members moving in the desired direction and the others...will peacefully and mechanically go along."

"The principle of social proof is so wide-ranging and powerful that its domain extends to the fundamental decision for life or death."

"Whenever possible we ought to sting those responsible for the rigging of social evidence."

- *Erroneous social evidence*, e.g. pluralistic ignorance or when certain actions/trends are replicated in a way that no longer makes sense. Periodically examine the evidence around you, like how a pilot monitors his instrument panel and environment instead of depending fully on the auto-pilot.

Liking



Generally, we're more likely to agree to someone's request if we know and like the person.

Friendships and personal relationships bring a sense of connection, safety and obligation, which influence our choices.

- *Tupperware parties* are a great example of how various weapons of influence are put to use. They evoke the *reciprocity* principle via upfront games and prizes, gain *commitment* by asking participants to share how they've used and benefited from Tupperware, offer *social proof* of people buying Tupperware at the parties and tap on the rule of *liking* by having your friend invite you to the party.

- A relationship can be leveraged even if the person is not physically present—one common tactic is through *referrals*. A salesperson gets a customer to admit that he/she likes a product, then asks for names of friends who'd also benefit from it. When the salesperson contacts the prospects, it's harder for them to say "no" to a friend's recommendation.

This principle works even if there are no established friendships—you simply need to **get someone to like you**. There are several factors that can predictably influence likability:

- *Physical attractiveness.* Good-looking people have an unfair social advantage because we unconsciously associate physical appeal with positive traits like talent, honesty, kindness, and intelligence. Attractive people are more likely to get help or change others' opinions. They even receive lighter sentences in criminal trials and higher-than-average compensations.

- *Similarity*. We tend to like people who are similar to us (in background, interests, opinions, age, religion, personality

KEY QUOTES

"An automatic-pilot device, like social proof, should never be trusted fully...it can sometimes go haywire by itself."

"The attraction, the warmth, the security, and the obligation of friendship are brought to bear on the sales setting."

"A halo effect occurs when one positive characteristic of a person dominates the way that person is viewed by others. And the evidence is now clear that physical attractiveness is often such a characteristic."

etc.). You can get someone to like you better simply by dressing like him/her or claiming to share similar interests.

- *Compliments*. When someone praises us, we tend to view him/her favorably, even if the praise is clearly inaccurate or comes with vested interests.

- *Contact and cooperation*. Generally, we like what's familiar. The more we're exposed to something, the more we're predisposed toward it, so long as (a) the exposure doesn't involve bad experiences (in which case familiarity can bring dislike) and (b) the other party seems to cooperate with us. Studies found that racial differences are more easily overcome when students of different races have to pool resources and cooperate to achieve a common goal. In law enforcement, the Good Cop-Bad Cop approach is commonly used to make the suspect like and cooperate with the "Good Cop".

- *Conditioning and association*. Our feelings toward people are affected by what we associate them with, e.g. we dislike people who bring us bad news even if they've not caused the news. That's why advertisers use celebrities and attractive models to associate their brands with beauty and desirability, and politicians try to associate themselves with positive news about job creation or advancement projects, even if they've not contributed to it.

All of us also unconsciously **associate ourselves with success** to look and feel good.

- People get emotional and defensive over their local or favorite *sports teams* because they associate themselves with the teams and take the wins and losses personally. On the day after a match, more people are likely to wear the winning team's jersey than the losing team's.

- We tend to use "we" when describing a *successful project*, and use "they" when describing a failure.

- Certain people (especially those with low self-esteem) tend to persistently *drop-names* to sound more successful or powerful.

KEY QUOTES

"We are phenomenal suckers for flattery... we tend, as a rule, to believe praise and to like those who provide it, oftentimes when it is clearly false."

"An innocent association with either bad things or good things will influence how people feel about us."

How to say no. It's hard to stop yourself from liking others. Instead, learn to identify when someone is deliberately using the rule of likability on you.

- Once you *notice the feeling of strong liking* for someone, ask yourself: In the time that you've known this person, is there reason for you to like him/her as much as you do?

- Even if you realize you like the person more than you'd have expected, don't assume you're being manipulated. Instead, make a deliberate mental effort to *separate the person from the request* he/she is making.

Authority

Each one of us, to varying degrees, is wired to **obey figures of authority**.

- Structure and authority are an integral part of *how our society functions*; without it, there'd be confusion and anarchy.

- Authority also offers a *short-cut to decision-making*, i.e. we let others do the thinking for us and simply get rewarded for following orders.

However, **blind obedience** is obviously undesirable.

- In an *experiment*, participants were instructed by an authority figure in a lab coat to administer increasingly larger voltages to another person, to supposedly study the relationship between pain and learning. Most participants followed orders even when the voltages reached fatal levels on the meter and the subjects were screaming and begging them to stop. [In reality, no charges were released in the experiment.]

- Many studies also found that *doctors' orders* in hospitals are followed blindly, even when the instructions obviously didn't make sense.

There are several symbols that reliably trigger our compliance to authority, and can be used to **influence our choices and behaviors.**

KEY QUOTES

"In making a compliance decision, it is always a good idea to keep separate our feelings about the requester and the request."

"We don't have to think; therefore we don't."

- *Titles*. We respect titles that take years of hard work and successes to acquire. Yet, it's relatively easy for con-men to forge credentials, or artificially improve their perceived status through related factors like size, height or other outward signs of power.

- *Clothes*. People wearing guard uniforms and business suits have been found to exert more influence over others. When a man wore a well-tailored business suit, he had 3.5x more pedestrians following him when he jaywalked, compared to when he dressed in normal clothes.

- *Trappings*. Other symbols of position and status (e.g. jewellery, prestige cars) also affect how we perceive and react to others.

How to say no. The best way to neutralise this principle is simply to be mindful that authority symbols can be faked.

- *Scrutinize the source of authority*, bearing in mind that it's a common trick for compliance practitioners to admit to a small flaw or weakness just to appear sincere and honest.

- *Ask 2 key questions:*

  i. Is this authority truly an expert? Filter out hollow symbols and examine if the credentials are valid and relevant.

  ii. How truthful can I expect this expert to be? Consider if he/she is truly credible and objective.

KEY QUOTES

"Titles are simultaneously the most difficult and the easiest symbols of authority to acquire."

Scarcity

Generally, we perceive something to be more valuable when it's limited in availability.

Human beings value choices and freedom, and are naturally **loss-averse**, i.e. we are more motivated not to lose something, than to gain something.

We also use an item's availability to **gauge its quality.**

- We value something more *if we see its quantity reduced before our eyes*, compared to if it had been scarce from the

"When our freedom to have something is limited, the item becomes less available, and we experience an increased desire for it."

onset. Downtrodden people who've always lived in deprivation tend to accept their fate, whereas those who experience a period of improvement followed by a sharp decline are more likely to rise in a revolution. Children whose parents give them privileges without consistent rules also tend to become more rebellious.

- We desire something the most if it seems to be less available due to *demand or competition*. That's why advertisers play up "by popular demand" or show queues of people flocking to snap up their goods. Property agents deliberately arrange for multiple prospects to view a house simultaneously. Even romantic pursuits seem more intense if there's a rival involved.

- *Things that are banned* also tend to be more desired. When information is censored, people not only want the information more, but tend to believe it more. Juries who were told not to consider a piece of information in a trial ended up using it even more.

There are several common **sales tactics** used to scare prospects into buying immediately so they won't lose a deal. The salesperson may tell you that there's only a *limited number* of products left, that an opportunity or offer is *expiring soon* ("limited promotion ends today!"), or you have to buy *right now*, because the price will go up or the item will no longer be available.

How to say no. When we encounter scarcity, our emotions take over and we're less likely to evaluate the situation thoughtfully.

- The first step is to *become aware of your emotional arousal*. Learn to scan your inner reactions so you're alert when someone is deliberately rousing you using scarcity tactics.

- Then, *evaluate the situation in 2-steps*: (i) Stop and calm yourself first, then (ii) ask yourself why you want that item. Scarcity may increase the value of possessing something, but doesn't improve its utility, i.e. a cookie won't taste better or satisfy your hunger more just because it is scarce. If you're buying something for consumption, consider its utility value so you won't give it an irrationally high value.

KEY QUOTES

"Not only do we want the same item more when it is scarce, we want it most when we are in competition for it."

"We react to information restriction...by valuing the banned information more than ever."

"In each instance, the intent (is) to convince customers of an item's scarcity and thereby increase its immediate value in their eyes."

"The joy is not in experiencing a scarce commodity but in possessing it. It is important that we not confuse the two."

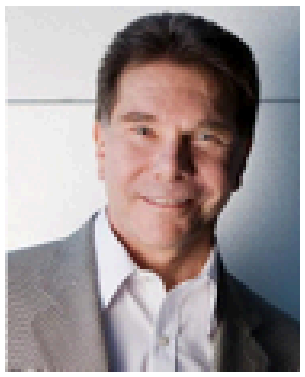
"We must remember that the item under consideration will function equally well whether scarce or plentiful."

Conclusion & Details in the Book to Look Out For

Each of these principles offer shortcuts to decision-making, but can also be used against us if we're not mindful. You can use the insights from this book to positively influence others and while protecting yourself from deception.

The book is full of detailed case studies and examples to explain each of the 6 principles, illustrate how and why they work, and how they can be used against us. For more details, please visit www.influenceatwork.com.

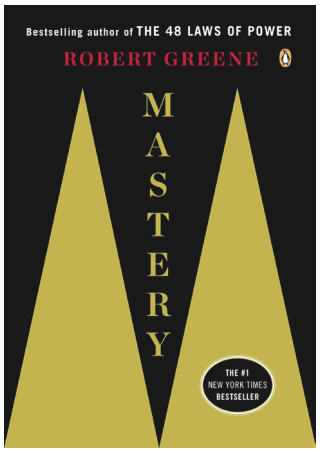
About the Author



Robert B. Cialdini (born 1945) is the Regents' Professor Emeritus of Psychology and Marketing at Arizona State University. He was previously a visiting professor at Stanford University, as well as at the University of California at Santa Cruz. Cialdini received his Bachelor of Science degree from the University of Wisconsin, earned his Ph.D. in Social Psychology at the University of North Carolina and received Postgraduate training in Social Psychology at Columbia University.

KEY QUOTES

"With the proper understanding of the nature of our opponent, we can come away from the compliance battlefield unhurt and sometimes even better off than before."



MASTERY

ROBERT GREENE

The Big "So What"

In this book, Greene examines the lives of exceptional historical figures like Charles Darwin and Leonardo Da Vinci to uncover how they become widely-admired Masters. Using the strategies in this book, you too can become a high achiever and attain mastery in your desired field(s).

Introduction

Mastery is the sensation that you're in full control of yourself, your environment and reality. As a master, you can enjoy both money and fulfillment doing what you naturally love.

Each of us is born with the **potential for greatness**.

- *Your brain is malleable*, i.e. it changes depending on how you use it. So, your actions literally shape your brain to affect your abilities and your life.

- Today, we have more freedom of choice and access to knowledge than past generations. With the right *beliefs, attitude and approach*, anyone can achieve greatness.

Based on extensive research on neuro/cognitive sciences and various Masters' biographies, Greene discovered that **mastery can be nurtured systematically in 3 phases**:

- *Apprenticeship*: This is when you learn the basics of a certain field.

KEY QUOTES

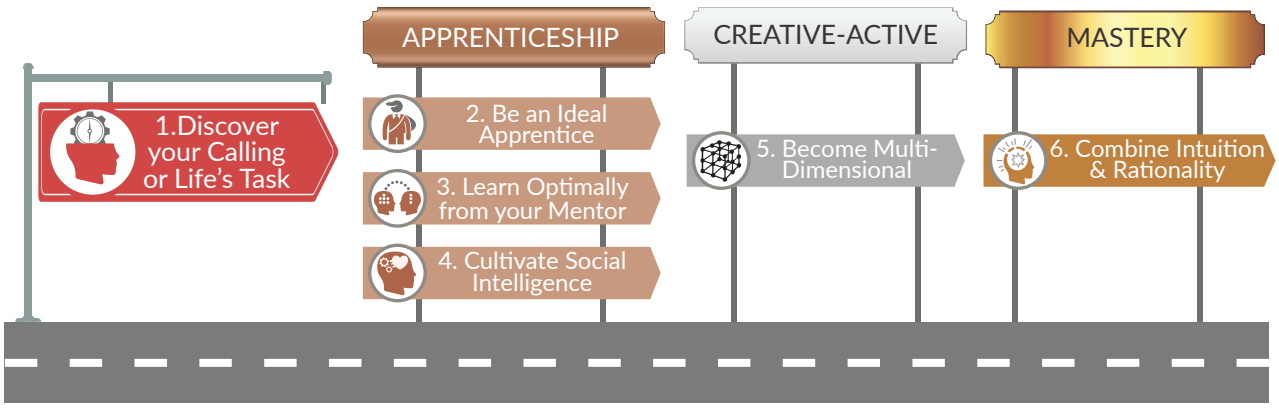
"Everyone holds his fortune in his own hands, like a sculptor the raw material he will fashion into a figure."
—Johann Wolfgang von Goethe

"Our dominance, our mastery does not stem from our hands but from… fashioning the mind into the most powerful instrument known in nature."

- *Creative-active*: With immersion and practice, you deepen your understanding of the field and start to experiment with your own methods.

- *Mastery*: You have such high levels of focus, knowledge and experience that you can see the full picture and bend/change the rules to achieve spectacular results. It typically takes at least 10,000 hours of intense practice, or about 20 years to attain the required combination of skills, knowledge, and intuition.

In this summary, we'll present the strategies and tips for the 3 phases of Mastery in 6 parts.



KEY QUOTES

"Intuitive powers at the mastery level are a mix of the instinctive and the rational, the conscious and the unconscious, the human and the animal."

Part 1: Find Your Calling or Life's Task

All of us have an **internal force** that nudges us toward our calling or Life's Task. As a child, you were intuitively drawn to certain topics or activities. Yet, as you mature, this force may be muted due to social pressures—you end up working for money or for others' approval and get disconnected from your true identity.

"You possess a kind of inner force that seeks to guide you toward your Life's Task—what you are meant to accomplish in the time that you have to live."

Look inward and **reconnect with your natural inclinations**.

- *Find your vocation* or the work that's deeply connected to who you are. When you find your ideal vocation, it feels "right" and you find yourself learning much faster with a sense of child-like wonder.

"Your vocation is more than the work that you do. It is intimately connected to the deepest part of your being and is a manifestation of the intense diversity in nature and within human culture."

- When you *align your efforts with your passions*, it's easier to sustain the years of hard work required on the path to mastery.

5 Strategies to Discover Your Life's Task

Primal Inclination Strategy: Think back on what fascinated you as a child: did you respond profoundly to an object, feel empowered by certain activities, feel fascinated by certain cultural aspects, or feel inspired by a specific Master? Consider the things that still bring out a sense of child-like wonder, visceral feelings and deep connection in you. Leonardo Da Vinci spent hours as a child contemplating nature and drawing things in painstaking detail. This continued into his adulthood, where he was always trying uncover the essence of life by studying and creating things.

Darwinian Strategy: Don't follow a conventional career path and compete in a crowded space. Find the perfect niche that you can dominate using these 2 approaches:

- *Move in a broad direction, then keep narrowing your path* until you reach a specialized, unoccupied niche. As a child, V. S. Ramachandran was obsessed with science books and seashells. He went on to research human anatomical abnormalities, optical illusions and blind spots, before moving into visual psychology. He knew he'd found his niche (anomalous neurological disorders) when he stopped feeling restless or out of place for the first time in his life.

- *Develop expertise in multiple areas then combine them* in a unique way. Yoky Matsuoka was an accomplished tennis player who left her sporting career to study electrical engineering, then artificial intelligence in robots. She eventually combined her interests/expertise to create a new field called neurobotics.

Rebellion Strategy: Actively rebel against the forces that lead you toward the wrong career (e.g. parental influence, fame, money). In his early music career, Mozart's potential was limited by his father's tight control. After Mozart reached adulthood, he finally broke free to pursue his own path. This alienated him from his father, but led to the creation of his most famous masterpieces today.

KEY QUOTES

"In order to master a field, you must love the subject and feel a profound connection to it. Your interest must transcend the field itself and border on the religious."

"Ultimately you create a field that is uniquely your own."

"Your true self…comes from deep within you…It exists for a purpose, and it is your Life's Task to bring it to fruition."

"It is a healthy part of your development to…establish your own identity. Let your sense of rebellion fill you with energy and purpose."

Adaptation Strategy: Don't be trapped by your past choices. If something isn't working for you, let it go and find creative ways to adapt/apply your existing skills and experience. After Freddie Roach was forced to retire as a championship boxer, he felt disgruntled and became a telemarketer. Later, he realized that his real passion wasn't for boxing, but for competitive sports and strategies. He started to train other boxers using novel training methods and went on to become the most successful trainer of his generation.

Life-or-Death Strategy: Even if you've deviated from the right path, it's never too late to get back on track. Let your failures and weaknesses turn you from the wrong paths, and focus on becoming excellent at the things that you're good at.

- After a series of setbacks, *Buckminster Fuller* was so disillusioned that he attempted suicide. At the last moment, he had an epiphany. He realized that his "mistakes" were merely the Universe's way of directing him in a better direction. He followed his inner voice and conceived many game-changing inventions and ideas.

- *Temple Grandin* was born with autism and struggled with many things. She focused on the 2 things she was good at—interacting with animals and building things with her hands—and found her niche as a specialist on animals and autism.

Part 2: Be an Ideal Apprentice

All Masters go through a **transformative phase** in their lives, like how a butterfly emerges from its chrysalis. This typically involves a self-directed apprenticeship that lasts 5-10 years.

- Theoretical knowledge from your formal education isn't enough. You need a *practical education* to learn how the world truly works, develop practical skills and discipline, and train yourself to think independently.

- During the apprenticeship phase, your goal is not to seek money or status, but to *transform your mind and character*. Choose a role that will give you the greatest

KEY QUOTES

"Your Life's Task is a living, breathing organism."

"In the end, the money and success that truly last come not to those who focus on such things as goals, but rather to those who focus on mastery and fulfilling their Life's Task."

"One can have no smaller or greater mastery than mastery of oneself."
– Leonardo da Vinci

"See your apprenticeship as a kind of journey in which you will transform yourself, rather than as a drab indoctrination into the work world."

growth opportunities. Charles Darwin spent almost 5 years on a ship collecting life and mineral specimens. The voyage transformed him from a reluctant student to a committed, enthusiastic naturalist. The insights from those months of real-world study sparked his theory of evolution, which he then devoted his life to validating.

The 3 Modes of Apprenticeship

Learn how to learn, so you can conquer any field.

Passive mode: observe deeply. Every field involves centuries of accumulated knowledge, rules and relationships. Drop your preconceptions, so you can absorb what's really going on.

- Pay close attention to (i) *how things are done* (including explicit/hidden rules and procedures), and (ii) the *power dynamics* (including the relationships, communications and control structures). These help you to navigate the environment, develop observation and analytical skills, and build the habit of diagnosing a situation before jumping into action.

Practice mode: develop skills. In the Middle Ages, young people spent 7 years to learn their craft as apprentices, observing and imitating their masters, then repeatedly practicing the skills.

- *Build 1 new skill at a time*. Don't multi-task.
- *Persist with focused, repeated practice*. Prolonged and consistent practice changes your brain neurologically, so the skills become hard-wired. Don't jump from task to task: 2–3 hours of focused work is much better than 8 hours of distracted work.
- Once you can do an action automatically, step back to *assess how to improve*. Observe yourself from a distance, get feedback from others and measure your progress.
- You'll experience a *cycle of accelerated returns*: what used to be hard will get progressively easier and more pleasurable. You will also be gradually transformed.

KEY QUOTES

"The ability to observe any unfamiliar environment will become a critical lifelong skill."

"Concentrated practice over time cannot fail but produce results."

The pain and boredom we experience in the initial stage of learning a skill toughens our minds, much like physical exercise.

"You cannot make anything worthwhile in this world unless you have first developed and transformed yourself."

Action mode: experiment with new approaches. Force yourself to start experimenting *before* you think you're ready. In so doing, you'll know where you stand, get feedback to improve, gain a thicker skin, and learn to manage your ego. Use failures and criticism as fuel to improve yourself. This prepares you for the next phase where you must deliver results under constant scrutiny.

8 Strategies for a Successful Apprenticeship

Focus on learning, not money. If you develop the desired skills, you'll eventually earn money. But if you focus on money, you may end up with a career you dislike. Look for learning opportunities with hands-on work and great mentors. Offer to work for free so people may be more willing to teach you their trade secrets.

Keep pushing your boundaries. Interact with as many different people and ideas as possible to expand your mind. Whenever you start to feel comfortable, shake things up and seek new challenges.

Let go of your ego or sense of superiority. **Return to a beginner's mind**—have a child-like curiosity and openness, and be willing to depend on those who can teach you.

Achieving mastery takes time, and you'll likely feel frustrated or insecure along the way. **Be patient and trust the process**. If you keep working and learning, you will eventually make it.

Embrace discomfort and pain instead of avoiding them. Critique your own work ruthlessly. Push your focus, creativity etc. beyond your perceived limits.

Treat your failures as lessons—use them to uncover what you must change/improve to succeed in future.

Go beyond appearances (how things *seem* to be) to **learn how things really work**. Learn all the necessary skills in your field, including the "whats" (visible outcomes) and the "hows" (hidden secrets, underlying anatomy and connections that affect how things move and change).

KEY QUOTES

"What is important when you are young…is to train yourself to get by with little money and make the most of your youthful energy."

"Be relentless in your pursuit for expansion…Soon, ideas and opportunities will come to you and your apprenticeship will naturally complete itself."

"When it comes to mastering a skill, time is the magic ingredient."

"Repeated failure will toughen your spirit and show you with absolute clarity how things must be done."

Don't follow a fixed career path. **Grow through trial and error**, exploring different paths connected to your deepest interests and learning as many related skillsets as possible. Ideally, start a broad apprenticeship when you're young to expand your future options.

Part 3: Learn Optimally from Your Mentor

Life is short, so don't waste time learning without guidance. A good mentor can greatly **accelerate your apprenticeship**.

- *Michael Faraday* was the son of a blacksmith who learned about science through books and lectures. But he only developed real scientific know-how after he became an assistant to prominent chemist Humphry Davy. For years, Faraday soaked up Davy's knowledge while developing his own insights. He went on to develop theories that revolutionized 20th Century science and far outshone his former-mentor.

- You can self-learn using generic information from books/courses. However, good mentors speed up the learning process drastically by *tailoring the insights and feedback* specifically for you.

- It's best to have *1 mentor at a time*. But if you can't find a perfect mentor, find various mentors to fill different gaps.

Face-to-face interaction is crucial for learning the nuances behind a craft. Masters are busy, so you'll have to make the most of whatever time you get with them.

- To attract potential mentors, first *develop yourself*—demonstrate work ethics, organizational skills and an enthusiasm for learning. Be prepared to embrace menial work and add value to the Masters in whatever way you can.

- A strong mentor-protégé relationship requires *mutual emotional investment*—the mentor feels vested in your success, while you admire the mentor as a role model. Be humble, submit yourself fully and absorb all you can as an apprentice.

KEY QUOTES

"We must constantly ask the questions – how do things work, how do decisions get made, how does the group interact?"

"The right mentors know where to focus your attention and how to challenge you. Their knowledge and experience become yours."

"Mentors do not give you a shortcut, but they streamline the process."

"You want person-to-person access, however you can get it."

On the path to mastery, each mentor is only a stepping-stone to the next level. Your goal is to **surpass your masters**. Once you've internalized what they have to offer, move on without guilt. Don't stay in their shadows.

4 Strategies to Optimize the Relationship with Your Mentor

Build a productive emotional connection so your mentor is more likely to reveal trade secrets that're not usually shared with others.

Choose a mentor who suits your needs and limitations, including (i) the right skills and knowledge for your goals, and (ii) the right fit for your calling and learning style. You want someone to nurture your unique traits, not squash them. Sigmund Freud was a mentor to Carl Jung for 5 years, until Jung decided he could no longer accept Freud's dictatorial style. Still, the mentorship shaped Jung's self-identity and theories, without which he couldn't have started his own branch of psychoanalysis.

Embrace tough love from your mentor. A good mentor points out the harsh truths and puts you through the necessary ordeals, so you become grounded in reality and toughened to overcome challenges.

Don't just copy your mentors. Learn to think independently and **adapt their styles/ideas** to differentiate yourself. Piano maestro Glenn Gould spent 8 years learning from Alberto Guerrero before striking out on his own. By infusing Guerrero's teachings with his own spirit and creativity, he created a style that encompassed Guerrero's essence but was even greater.

As an apprentice gains mastery, he may disagree with the mentor and resent the latter's authority, while the mentor may try to suppress perceived threats or challenges to his authority. Seek to **create a two-way dynamic** in your relationship. Boxing coach Freddie Roach transformed Manny Pacquiao into a top boxer. Pacquiao never tired of Roach's coaching, while Roach used Pacquiao's improvisation and feedback to hone his own coaching

KEY QUOTES

"Your goal is always to surpass your mentors in mastery and brilliance."

"You must get the sharpest dose of reality that is possible from your mentor. You must go in search of it and welcome it."

"Poor is the apprentice who does not surpass his Master."
– Leonardo da Vinci

"Once a back-and-forth dynamic is sparked, the relationship has almost limitless potential for learning and absorbing power."

techniques. Receive instructions respectfully but occasionally push back to clarify what you need, adapt some of the ideas or offer feedback on their instruction.

Part 4: Cultivate Social Intelligence

Social intelligence is the ability to see people as they are, instead of how we imagine them to be. It improves your relationships and quality of thinking. On the other hand, social naivety leads to mistakes, conflict and confusion, leaving you with little time/energy for mastery.

- Understand the reasons behind others' behavior so you can *manage each person or situation* like playing a game of chess. Benjamin Franklin was famous for his social intelligence. To get the French's support in the War of Independence, he shed his celibate habits to adopt the French's lavish and wanton lifestyle. Many Americans criticized him, not realizing this was his key to winning the French's trust and brokering a vital military alliance.

- *Accept human nature as it is*. Everyone has a dark side (e.g. being manipulative, defensive or greedy). Don't get overly upset or cynical about people, nor try to change them.

Master human nature in 2 parts:

- *Specific knowledge* of human nature, i.e. the ability to read people and understand their character and viewpoints. Pay close attention to what they say/do over time, their non-verbal cues and their work/living spaces. Put yourself in their shoes to understand what they're going through.

- *General knowledge* about timeless patterns of human behavior. Learn to detect and avoid these 7 ugly aspects in all humans:

  (i) *Envy* can lead people to block you. Be humble, display some weakness or insecurity, and don't make others feel stupid.

  (ii) Every group requires some *conformity*. Blend in and don't voice your dissent openly, at least until you've established your position in the group.

KEY QUOTES

"To be truly charming and socially effective you have to understand people, and to understand them you have to get outside yourself and immerse your mind in their world."

"Better to accept…people as one accepts the thorns on a rose. Better to observe and accumulate knowledge on human nature, as one accumulates knowledge in the sciences."

"People will say all kinds of things about their motives and intentions…Their actions, however, say much more about their character."

(iii) People may *rigidly* stick to what's familiar. Outwardly respect others' need for order but seek fresh ideas on your own.

(iv) People will always act in their *self-interest*. When making a request, always appeal to what's in it for them.

(v) People are *lazy* and prefer faster/easier paths to their goals. Don't let others steal your ideas/credit or pass you the hard work in the guise of collaboration.

(vi) People often make *flighty*, irrational decisions. Focus on what others do, not what they say or promise.

(vii) To counter *passive aggression*, avoid direct confrontations. Exit the conflict or use a subtle/indirect counter-attack.

KEY QUOTES

"Think of the workplace as a kind of theater in which you are always wearing a mask."

4 Strategies for Developing Social Intelligence

Don't fight political maneuvering or resistance head on. **Speak through your work**—be efficient, involve others, embrace feedback, deliver results, and show you can advance the group's objectives.

People *will* judge you based on your appearance. **Design personas** that suit you (e.g. mysterious, imposing). Switch your personas to match your environment, like how a performer wears various masks.

We're usually oblivious to our social flaws. **Consider how others see you**: get feedback and reflect on past conflicts to honestly assess how you may have contributed to the problems.

Don't waste your energy on fools who lack common sense, focus on the wrong things, or create trouble. Use them to remind yourself what not to do, or turn their foolishness to your advantage.

Part 5: Become Multi-Dimensional (Creative-Active)

During childhood, our minds are totally open, we experience the world using all our senses and anything seems possible. Yet, as we grow up, we start to limit ourselves with rules and assumptions. Masters have a "Dimensional Mind" that combines a child-like spirit with focused, disciplined learning.

- There are *2 criteria* for cultivating the Dimensional Mind: (i) deep knowledge of a subject and (ii) the ability to apply this knowledge in flexible, original ways. After Mozart broke free from his father's strict control, he was able to create a totally new style of music by combining 20 years of musical experience with his inner voice and creativity.

- Learn the rules of a field during your apprenticeship without being limited by them. *Challenge and reshape the rules you've learned*. Keep expanding your skills, knowledge and experience by exploring new fields, making new connections and experimenting with new concepts.

3 Steps to Become Multi-Dimensional

Choose a **creative task** that'll maximize your skills and knowledge.

- Pick a task you're *obsessed about* and feel deeply connected to. For Mozart, it was composing opera music. For Edison, it was solving the electric light riddle. You'll need the passion to sustain you through the hard work and setbacks.

- Ideally, pick something that triggers your sense of *rebelliousness*. Make sure you have the skills and knowledge to realistically pull it off, but be prepared to embrace uncertainty and discomfort

Use 5 **creative strategies** to continuously stretch your mind:

KEY QUOTES

"Masters…are simply people who manage to retain a sizeable portion of their childhood spirit despite the pressures and demands of adulthood."

"As you emerge from your apprenticeship, you must become increasingly bold."

"Think of yourself as an explorer. You cannot find anything new if you are unwilling to leave the shore."

- "Negative capability" is the ability to *embrace the unknown*. Accept that you don't know everything. Suspend your judgment, consider conflicting views, and see the world as it is instead of fitting things into your pre-conceptions. This opens your mind to creative alternatives.

- *Allow for unexpected discoveries*. Broaden your research to include diverse fields and examples that can disprove your theories. If you're tensed, take a break or switch to a relaxing activity. A relaxed mind absorbs inputs better and makes more connections, which can lead to serendipity. You can also use random words, images or analogies/metaphors to jolt your brain into fresh ways of thinking.

- Alternate between real-world observations and mental speculations about what they mean. *Repeatedly develop theories then test them in reality* to grasp complex concepts beyond your limited human senses (e.g. electricity, evolution, gravity).

- *Expand your perspective*: (i) look at "what" and "how", (ii) examine details in addition to the big picture (to see how the parts fit into the whole), (iii) examine anomalies (not just the norm) and (iv) look at what's missing (not just what's present).

- Don't limit yourself to words. Humans naturally think in images, so use visuals and 3D models to crystallize your ideas. If possible, *activate all your senses*: use music, paintings, fragrances etc. to stimulate your brain.

Create the ideal conditions for a **creative breakthrough**. Masters set high standards and work with such intensity and urgency that it pushes their minds to new levels. Yet the solution often surfaces when/after they take a break. Push yourself as hard as possible, then let go periodically when you feel strained or hit a creative block.

- *Set deadlines* to force your brain to work at an unusually-high level of intensity. French mathematician Evariste Galois was about to enter a duel and knew he may die. He worked fervently on several complex math problems that had remained unsolved for a long time, and managed to complete most of them.

KEY QUOTES

"To negate the ego you must adopt a kind of humility toward knowledge."

"Chance favors only the prepared mind."
– Louis Pasteur

"Creative people are actually looking at what is hidden in plain sight, and not rushing to generalize and label."

"Creativity is by its nature an act of boldness and rebellion."

- When you feel stuck, *take a break*. The solution may just come to you after that. Albert Einstein spent 10 years studying general relativity and decided one night to give up. After a night's rest, he woke up with the solution.

Beware of these **6 common emotional obstacles** to creativity: complacency, conservatism, dependency on others, impatience, egotism and inflexibility.

9 Creative-Active Strategies

The Authentic Voice. Learn the basics and absorb a wide range of styles/techniques. Once these are hard-wired in your system, your mind is free to creatively combine and personalize them until you find your unique voice.

Look for "facts of great yield". It's better to examine many facts that'll lead to 1 big discovery, than to succeed in many trivial ideas with minimal impact. Scan for anomalies or intriguing facts that could reveal a hidden truth with a huge impact (e.g. debunking a prevailing norm, or a discovery with unlimited applications). Dig deeply to uncover those truths.

Don't study just 1 part of a system. Assume all parts are closely intertwined. Take the time to examine the topic from different angles and study the **complex interlinkages**.

Develop the **mechanical intelligence** required for superb craftsmanship and long-term success. Personally test/use your creations so you can see/sense how the parts work together holistically. The Wright Brothers beat teams of well-funded engineers to build the world's 1st motor-operated airplane. Instead of using abstract plans and specialists for different parts, they figured out the mechanics of flight by testing many different theories and prototypes in real life.

Give time to your creative process. Initially, give yourself time to dream and explore, using powerful emotions to drive your ideas. Then, refine your ideas without being fixated on your initial vision.

KEY QUOTES

"What you want in the end is to internalize the voice of your Master so that you become both teacher and pupil."

"Better to look into ten such facts, with only one yielding a great discovery, than to look into twenty ideas that bring success but have trivial implications."

"The extreme paradox is that those who impress the most with their individuality...are the ones who first completely submerge their character in a long apprenticeship."

If everyone follows established norms, the culture feels cluttered. When you **go against convention** to pursue an idea you feel strongly about, it's like creating an open field to plant and grow your idea. People will be drawn to that new space.

When you're stuck with technical details, **zoom out** to reconnect with a broad inspiring vision and free your mind to see new paths.

The creative process doesn't follow a straight line. Your breakthrough could very well come from a random event that connects everything you've learned over the years—a process known as "**evolutionary hijack**".

We tend to think in binary terms (e.g. good vs bad, pain vs pleasure) when things don't fit into neat categories. Remove those artificial constraints and consider how to blend opposites into **third alternatives**.

Part 6: Combine Intuition & Rationality (Mastery)

There's a **higher form of intelligence** that enables us to grasp the intangible and predict trends, much like a sixth sense. Masters often talk of seeing something "more". Chess master Bobby Fischer could see forces that predicts how a chess game would unfold. Albert Einstein had a mental image of how the universe worked that others couldn't conceive.

This intelligence is cultivated through years of intense and persistent immersion in a field. You acquire such a thorough understanding of the intricacies in a field that you can **combine the rational and intuitive** to grasp the complex realities.

- There's a limit to our *rational, conscious minds*. We can break down a complex system by studying its parts, e.g. trying to understand an animal by studying its anatomy and behaviors as separate parts. But we miss the unseen, complex forces behind how living organisms evolve, or how entire ecosystems or galaxies work.

KEY QUOTES

"Creativity and adaptability are inseparable."

"By delving into the chaotic and fluid zone below the level of consciousness where opposites meet, you will be surprised at the exciting and fertile ideas that will come bubbling up to the surface."

"The reasoning of Masters is guided by intuition; their intuition springs from intense rational focus. The two are fused."

- During their years of study, Masters absorb info, apply and internalize them to the point that they're *deeply locked into their memory*. They can perform their craft by reflex, which frees up their minds to make sub-conscious associations. Their minds keep expanding until they can grasp complex realities in their entirety.

It typically takes 15-20 years to **develop your intuition** in an area.

- Masters learn to pay attention to high-level intuitions and *act upon them*. Some lead nowhere while others produce great insights. With time, they can call up these intuitions more automatically and fuse them with their rational thoughts.

- *You can't rush the process*. Exercise self-control, trust the process, commit yourself to intense study and take one step at a time.

7 Strategies to Attain Mastery

Masters don't try to fit into a conventional mold. They follow their inner compass, even if it means facing others' ridicule and criticism.

Connect deeply with your environment: observe it closely and experience it both physically and viscerally. Become so highly attuned to your environment that you can sense changes before they occur. Caroline Islanders can navigate complex oceans without any maps or instruments—they use their brain's primal powers alone to navigate using star constellations and the sun's position.

Play to your strengths. Swim with the current, not against it. Albert Einstein disdained convention and traditional learning, but was great at using mental images to solve abstract puzzles. He boldly decided to work by himself, turning over novel ideas in his head and challenging prevailing norms to develop the Theory of Relativity.

When we're learning a new skill (e.g. driving a car or plane), we must consciously think of the steps, as if our mind and body are disjointed. With repeated practice, you can

KEY QUOTES

"We embrace the natural complexity of life, making the brain expand to the dimensions of reality instead of shrinking it to the narrowest of specializations."

"Mastery is not a function of genius or talent. It is a function of time and intense focus applied to a particular field of knowledge."

"If there is any instrument you must fall in love with and fetishize, it is the human brain—the most miraculous, awe-inspiring, information-processing tool devised in the known universe."

"Know your strengths and move with them."

achieve mind-body integration to operate seamlessly. If you keep mastering new skills, you'll have layers of information at your fingertips that can be called up easily.

Leonardo da Vinci spent decades to observe, contemplate and create elements of nature until he could express the very essence of life in his artwork. View your work as being alive—absorb the details until you can capture the life force as an intrinsic part of your work.

Gain a bigger perspective, so you can think strategically beyond the present moment. Freddie Roach gained a holistic perspective of competitive boxing after years of experience as a boxer and apprentice trainer. He then helped his fighters to see the full picture of the fight and develop/practice holistic strategies.

To truly understand something, you must immerse yourself in it. If you research something from the outside, you unknowingly filter the data and analysis through your own assumptions. The only way to truly understand other people or cultures is to learn from the inside by experiencing their beliefs, values and perspectives.

Johann Wolfgang von Goethe first found fame as a writer in his 20s. But when he died at 83, he was revered as a genius—not only in literature but also in science, politics and history. His mastery was in the way he connected various topics after decades of deep observation and thinking. Draw from and connect knowledge from all fields to become a universal man/woman.

Conclusion and Other Details in the Book

Mastery is attainable by anyone who's willing to work for it. Listen to your inner voice, direct your focus to observe, think deeply and practice something repeatedly until it's intuitive to you. Then, keep building on that intuition to continually move to the next level.

KEY QUOTES

"Your path to mastery is to study and absorb these details…to the point at which you feel the life force and can express it effortlessly in your work."

"[Mastery] is a power and intelligence that must be continually renewed or it will die."

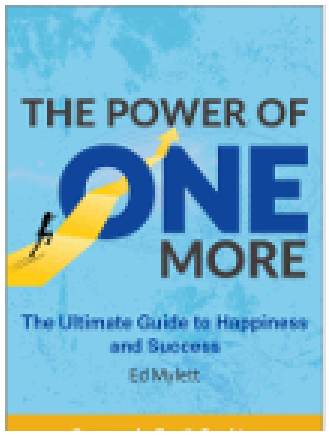
This is a voluminous book that includes many detailed stories and anecdotes of Masters from all walks of life, e.g. sports, architecture, anthropology, art, business and medicine. Greene presents each idea with specific examples, deep insights and nuances to help us understand what the journey to mastery entails.

About the Author

Robert Greene (born 1959) is an American author best known for his books on strategy, power and seduction Besides this book, he has also written several bestsellers including "The 48 Laws of Power", "The Art of Seduction", "The 33 Strategies of War" and "The 50th Law (with rapper 50 Cent)".

Greene attended the University of California, Berkeley, before finishing his degree at the University of Wisconsin-Madison with a B.A. in classical studies. Before becoming an author, Greene estimates that he worked 80 jobs, including as a construction worker, translator, magazine editor, and Hollywood movie writer.

KEY QUOTES



THE POWER OF ONE MORE

The Ultimate Guide to Happiness and Success

Ed Mylett

The Big "So What"

Small steps can unlock big breakthroughs. In this book, Ed Mylett shows how doing one more—one more try, one more habit, one more act of courage—can reshape your identity, mindset, and results to create lasting success.

Introduction

Extraordinary success isn't built on massive leaps, but on small, intentional decisions made consistently. Ed Mylett learned this through personal experience, from growing up with an alcoholic father to building a multimillion-dollar business.

- Drawing from his life, coaching work, and insights from peak performers, Mylett presents a simple yet powerful philosophy: *the Power of One More*. This approach combines mindset shifts, daily habits, leadership principles, and personal strategies to help you progressively level up—personally, professionally, and spiritually.

- In this summary, we'll break down *18 levers of transformation* that you can apply to raise your standards, sharpen your focus, and become the person you were meant to be.

KEY QUOTES

"The Power of One More teaches you to combine your gifts with directed, intentional thoughts and focused actions."

"You were not born to be average or ordinary. You were born to do something great with your life."

"You may be surprised how one more thought and one more action will change your life forever."

"One more thing is often all it takes. And frequently, it's only one more step away from where you are now."

Harness the Power of the One More Philosophy

One More Identity Shift

Your identity is how you see yourself—the collection of your deepest thoughts, beliefs, and expectations. Your identity acts like a thermostat that controls your life conditions, defines your self-worth, and silently controls your results in every area of life.

- For example, you might want $10 million, but if your thermostat says "I'm not worth that much," you will sub-consciously *self-sabotage*—blowing deals or over-spending until you're back at a level you believe you deserve.

- Your identity is often formed by childhood and life experiences. In other words, *it's not fixed and can be changed*, one action at a time. Every time you keep a promise to yourself—whether it's waking up early or following through on a task—you build self trust. As your self-image improves, so do your results.

You can't achieve 100 degrees of fitness, wealth, or love if your identity is stuck at 75 degrees. Raise your internal thermostat and upgrade your identity using 3 levers:

KEY QUOTES

"What we perceive about ourselves is what we believe about ourselves."

"They always say time changes things, but you actually have to change them yourself."
—Andy Warhol

"Are you willing to sacrifice who you are for who you could be?"

- *Faith*: Believe that you were created for more, and your life has purpose.
- *Intentions*: Set empowering statements each day, like "I'm here to serve, grow, and lead." Or, "I'm healthy, loving, and successful."
- *Associations*: Surround yourself with people who uplift you, and challenge you to grow.

One More Mental Filter

Your brain doesn't show you the world as it is; it shows you what it is trained to notice. The Reticular Activating System (RAS) is the mental filter in your brainstem. It sifts through billions of data points and only lets in what's important to you.

- *What you focus on gets amplified*. The RAS doesn't judge what's good or bad. It simply amplifies your beliefs and focus.
  - For example, once you decide to buy a white SUV, you suddenly start seeing white SUVs everywhere. The SUVs were always there, but now your RAS tags them as important.
- This explains the *confirmation bias* and how expectations of both success or failure can be self-fulfilling.
  - Once you install a belief (e.g. "I'm great at solving problems"), your RAS finds evidence to prove it. This creates a self-reinforcing loop: beliefs → attention → actions → results → stronger beliefs.

Your RAS learns what matters to you through the thoughts you repeat, the images you visualize, and the emotions you associate with them. To reprogram the RAS:

- Set a *clear goal*, e.g. "I want to lose 20 pounds in 6 months." Focus on what you want (e.g. "I want to be strong and healthy"), not what you don't want (e.g. "I don't want to be overweight").
- *Vividly visualize* what that looks, sounds, and feels like.
- *Repeat* daily with conviction and emotion, out loud or in writing.

KEY QUOTES

"Let faith move mountains in all parts of your life."

"Apply good intentions to all parts of your life, and then watch what happens."

"When you see a happy or financially successful family, understand that at some point in their history, they weren't happy or successful. That is, until...The One in that family changed the family tree forever."

"Put actions to these thoughts. It's not enough to mentally convince yourself. You can't wish your way to success."

"The stronger your beliefs, or the more emotionally charged an issue is to you, the stronger your confirmation bias and selective recall will be."

"Through repetition, your obsessions eventually become your possessions."

One More Attempt

Success is a numbers game. When you feel stuck or discouraged, don't give up. Just give it one more try.

- Success doesn't come from giant leaps, but from *consistent steps forward*. It's like learning to ride a bike—you might wobble and fall at first, but each attempt builds skill and confidence, until it clicks. What once seemed hard now becomes second nature.
- Ed Mylett compares success to hitting a piñata. *You might not see results initially* from the first few swings. But if you keep swinging, the piñata eventually bursts open and the reward spills out.
- Don't quit just before the breakthrough. In 1998, Mylett nearly quit when only 8 people showed up for his business presentation, but he decided to go all in and give it one more shot. That became the *turning point* of his career, eventually leading to millions in income and impact.

Small steps compound over time to create massive transformation.

- Persist with *focus and intention*. Know where you're headed, put in your best effort, and keep adjusting until you reach your goals.
- *Believe in your ability* to create change. As you push your limits, you learn and expand your capacity. You also develop a quiet confidence that you're going further than most people ever will.
- When you give your all and "*empty your tank*," you make space for new opportunities, beliefs, and identity.

One More Time Advantage

Time is your most limited resource. Master 5 powerful principle to bend and multiply time, control your schedule, compress work and expand results that matters.

KEY QUOTES

"You stack [wins] on top of each other to produce significant long-term changes in your life."

"Your greatest gains and successes happen when you push yourself to new places and new limits...our new level of capacity becomes your new norm."

"Most people give up. They don't do the work you're willing to do. So, they won't get the results you'll get."

"Empty your cup, so that it may be filled."
—Bruce Lee

"When the goal is further away, you jog toward that goal. When it's right in front of you, it's a sprint."

- Most people move slowly when the finish line feels far away. *Shrink your finish line to create urgency* and turn your long-term goals into short sprints.

- *Convert 1 day into 3 mini-days*. Split each day into three 6-hour blocks: morning (6am-12pm), afternoon (12pm-6pm), and evening (6pm-12am). Treat each time block as a full day to create urgency and focus, effectively giving you 21 days a week instead of 7.

- *Control time* rather than let it control you. Take charge of the first 30 minutes of your day to shape the entire trajectory. Avoid phones or external inputs. Use that time to align with your values, review your goals/priorities, and plan your day.

- What gets measured, improves. *Measure performance regularly* on a weekly, daily, or even hourly basis, so you can do course correction quickly and improve fast.

- You can't move forward if you're stuck in the past. *Focus on the future* and take action now toward your goals and dreams.

KEY QUOTES

"There is a direct correlation between how fast you'll run versus how close you are to the finish line."

"Your relationship to time can profoundly affect how far you go in life."

"Where performance is measured, performance improves."

One More Emotional Reset

We all live in an "emotional home", i.e. there's a pattern of dominant emotions we return to each day.

- Such emotional patterns *shape our decisions and quality of life*. Those who consistently experience love, joy, and peace enjoy better well-being (regardless of wealth or status) compared to those stuck in anger, anxiety, or guilt.

- We unknowingly *"hoard" harmful emotions*, e.g. if you're used to disappointment, you expect more of it. This leads to emotional clutter that clouds our judgment. We also *repress emotions*, which resurface in other forms (e.g. stress, illness, self-sabotage).

Emotions are neither good nor bad. They can help us to make sense of what's happening inside/around us. Even fear, guilt, and anxiety can be harnessed for motivation or protection. The goal isn't to avoid negative emotions, but to manage them intentionally so they don't define your life.

"Your mind always seeks out what is familiar because there is a level of comfort, even when the familiar works against you."

"Hoarding emotions dulls your ability to distinguish between reality and what you perceive to be reality."

"Too much of any emotion, perceived as either good or bad, doesn't serve you well."

- Be honest about what you're feeling and why, e.g. you might buy flowers to feel love, or chase promotions to feel pride. By *naming the emotions driving your actions*, you can pursue goals with clarity instead of compulsion.

- *Remove emotional clutter* to make space for better feelings. Clear out resentment, guilt, or shame so they don't dominate your life.

- *Choose your dominant emotions intentionally*. Ask yourself: What 5-6 emotions do I want to experience every day? Commit to those emotions (e.g. joy, peace, gratitude), so your brain's RAS can start finding ways to create those feelings.

- Use *daily practices* to reinforce the desired emotions:

  (i) Meditate to clear mental clutter and set emotional intent.

  (ii) Balance work with rest, restoration and self-care.

  (iii) Identify and manage triggers that spark stress, anger or other destructive emotions.

  (iv) Consciously shift your focus from unhelpful emotions to supportive ones (e.g. shift from insecurity to gratitude).

One More Positive Connection

The people around you—family, teachers, friends, and colleagues—shape how you think, act, and grow. Some lift you up while others hold you back.

- Think of your relationships like a *bullseye with three rings*:

  (i) The *outer circle* includes strangers or acquaintances.

  (ii) The *middle circles* includes casual friends and colleagues.

  (iii) The *inner circle* includes the 2–5 people closest to you.

  (iv) You are the *bull's eye*. Those closest to you have the greatest impact on your identity, habits, and outcomes—and vice versa.

To raise your standards, you must refine your associations, especially your inner circle.

KEY QUOTES

"People are intentional about their actions, but rarely do we spend enough time thinking about the emotions attached to those actions."

"Once you learn to identify your emotions, they begin to loosen their grip on you."

"Honesty is the springboard from which every emotion emanates. Intentionality is the muscle you need to get you to those honest emotions."

"Like it or not, you are the sum of your relationships, and you are judged for it."

"To succeed in life, your peer group's standards must align with your own."

"You will never outperform your inner circle."
—John Wooden

"The people you allow into your inner circle are among the most important choices of your life. Choose wisely."

- Make sure the *2-5 people you spend the most time with* have things you want in your life (e.g. health, wealth, peace, or emotional strength).

- Sometimes, you must *distance yourself* from people who no longer support your growth—even if you love them.

- If you can't fully disconnect from certain people (e.g. family), then *raise your standards* to influence them positively. Don't let them lower your standards.

One More Dream Ignited

As children, we dream and imagine freely. But as adults, we often stop dreaming—held back by fear, regret, or the weight of past failures.

- When you stop imagining a better future, you stop moving forward. You get *stuck in survival mode*, constantly worrying about failing, looking foolish, or losing what you already have.

To live your best life, you must dream boldly, think freely, and act intentionally. Stop operating from memory, and start operating from vision and imagination.

- *Let go of the past* to create space for new possibilities. Imagine emptying your mental glass of old stories and painful scripts, then refilling it with new relationships, adventures, and dreams.

- *Give yourself permission to dream*. Drop unhelpful mental scripts like "I'm too old" or "It's too late."

- *Use your imagination intentionally*. Daydream to reconnect with your inner child, visualize your dream life, then take real steps to turn imagination into reality. When you reconnect with your dreams, you change your emotional state to attract people, ideas, and opportunities that match the future you see.

KEY QUOTES

"People ease in and out of our lives all the time. Everything has an expiration date."

"Go confidently in the direction of your dreams. Live the life you imagined."
—Henry David Thoreau

"The happiest people in life operate out of their imaginations and dreams, and not their histories."

"Dreaming is free...[but] a lack of dreaming will cost you everything."

"I use memories, but I will not allow memories to use me."
—Deepak Chopra

One More Good Question

The questions you ask shape your mindset and outcomes. To live fully and grow, ask better, braver, and more empowering questions.

- Stop asking *disempowering questions* like "What if I fail?" or "Why can't I get this right?"
- Use *bold, future-focused, empowering questions* to focus your brain on what matters, uncover truths and unlock possibilities. Better questions lead to better answers, better results, and better quality of your life. For example:

  (i) What's one more thing I can do to support my team or family?

  (ii) What's one more thing I can let go of that's holding me back?

  (iii) What's one more way I can bring peace, gratitude, or energy into my day?

- Each question plants a seed in your mind. You won't always have an immediate answer, and this could point to potential areas for growth. Just *sit with the questions* and let them challenge you, like peeling an onion layer by layer.

One More Goal That Matters

Real goals aren't just tasks or checklists. They energize you and turn inner desires into outward momentum. The right goals activate your brain, shape your focus, direct your actions, and pull in people and opportunities aligned with your vision.

There's no perfect goals system for everybody. Design a simple, flexible system that suits you. Some rules of thumb include:

- *Set goals in a peak state*—not when you're feeling discouraged or distracted.
- *Tie each goal to a compelling reason* that truly drives you. Ask yourself: Why does this matter? What's at stake if I don't follow through?

KEY QUOTES

"The unexamined life isn't worth living."
—Socrates

"If you want to change the quality of your thoughts, you need to change the quality of the questions you ask."

"Better questions lead to better answers. Better answers lead to a better life."

"In many cases, to grow, the best answers will be the most difficult for you to address."

"I believe goals are energy. Goals are a life force. Goals are a state of being."

"The right way to approach setting your goals is to keep to a simple plan of attack."

- *Link short-term goals to long-term dreams*, so you can build momentum with small wins that cumulatively move you toward something bigger and even life-changing. Figure out the required skills/resources, but don't complicate things by splitting them into sub-categories (like finance, health etc.)

- *Reinforce your goals daily*, using reminders, visual cues, or written reflections to keep them front of mind and emotionally engaging. Create and review goals regularly (e.g. hourly, daily, weekly, monthly, yearly).

One More High Standard

Goals vs standards: Goals are the outcomes that you want, while standards are the behaviors and expectations that you accept. To achieve high goals, you need high standards.

- You may not always hit your goals, but *you'll always fall to the lowest standards you tolerate*—whether it's your effort, habits, or relationships.

- While you can't always control your outcomes, you can always control your standards. If you want to change your life, first *raise your standards*.

Here are **9 ways to activate higher standards** in your life:

- *Know your why*: Strong emotional reasons keep you going.

- Break standards into *clear, specific steps*, e.g. "I'll work out 4x a week and follow a lean meal plan."

- *Be realistic*: Build from where you are, not where you wish you were.

- *Get help where needed*, e.g. find mentors or accountability partners to stay on-track.

- *Use technology*: Record a goals video while you're in a peak state, then revisit it when you need a boost.

- *Match your standards* to the size of your goals.

- *Drop perfectionism*: Progress beats perfection every time.

KEY QUOTES

"When you create a single list, the only thing to keep in mind is whether you're creating a momentum-building goal or a stretch, life-altering goal."

"What you think leads to what you need. When you consciously access what you need, your mind sets about the business of making your goals a reality."

"Goals without standards are empty."

"If you want the best possible chance of reaching your goals, you need to adjust your standards, and reaching your goals will become almost automatic."

"If you're willing to tolerate something, that's probably what you're going to get."

"Be selfish when it comes to developing your standards. This is your journey...It's personal."

"Perfection is the lowest standard there is. And realistically, perfection doesn't exist."

- Plan ahead, but *don't overthink*. Just begin and adjust as you go.
- Focus on *your values*, not others' expectations.

One More Impossible Thought

To live an extraordinary life, you have to think bigger and act bolder than what feels comfortable or realistic.

- Dare to imagine what others consider "impossible", then act as if these are already within reach. The *intensity of your actions* must match the size of your goals.
- Align your thoughts, words, and behavior. *Close the gap between what you say and what you do*. Build belief and conviction in your dream, then take action like it's possible—even if you feel uncertain or afraid.

One More Habit Installed

Habits shape your life far more than motivation. That's because habits are automatic—they run in the background, influencing your behavior without conscious thought.

- Habits follow a predictable loop: *Trigger → Action → Prize*. To create lasting change, you must rewire this loop:
  - (i) Trigger: Every habit starts with a trigger or a cue (e.g. sitting on the couch after work);
  - (ii) Action: The cue triggers a behavior (e.g. grabbing a bag of chips);
  - (iii) Prize: The behavior delivers a reward (e.g. dopamine hit from the chips) which reinforces the habit.
- To replace old habits with new ones, you can *change any of the 3 elements* until it becomes your new default loop.
  - (i) Replace the trigger, e.g. take an evening walk instead of sitting at the couch.

KEY QUOTES

"Thinking is good. Overthinking is bad!"

"Unless you put actions to those thoughts, you're not going anywhere in life."

"You must be willing to dream big, take a chance, set your barriers aside, and do it anyway."

"Alignment occurs when your thoughts manifest themselves in the actions you take."

"Motivation and inspiration come and go. But rituals and habits are constant."

"Getting fired up about living your life well each day is important but nowhere near as important as having good habits."

"A habit cannot be tossed out the window; it must be coaxed down the stairs a step at a time."
—Mark Twain

(ii) Upgrade the action, e.g. replace the chips with herbal tea.

(iii) Attach a better prize, e.g. watch your favorite show only after you consume tea instead of chips.

It usually takes about 30 days of consistent action to install a new habit, but the effort pays off. Keep building better habits that support your goals and values—whether it's eating clean, sleeping better, nurturing your faith, or spending time with loved ones.

One More Team Multiplier

A multiplier is someone who elevates everyone and everything around them. They don't just deliver results—they inject belief, synergy, and momentum that lift the entire team, making the whole much greater than the sum of its parts.

- Take *Tom Brady*, for example. When he joined the Tampa Bay Buccaneers in 2020, the team hadn't made the playoffs in over a decade. But within a year, they won the Super Bowl. That was possible because Brady brought more than skill; he also brought urgency, discipline, and belief. He changed how the team trained, communicated, and thought, and he attracted other elite players onto the team.
- It's not just about talent, but having the *team chemistry* and the right mix of people that bring out the best in one another.

Leaders can help multipliers to thrive by creating the right environment:

- *Show the big picture* so they can see how their work matters and how they can contribute meaningfully beyond their role.
- Create *opportunities for them to lead*, share ideas and influence outcomes naturally.
- Give them *freedom to execute*. If possible, pair them with mentees who can grow alongside them.
- Free them from low-value tasks so they can *focus on what they do best*. Challenge them with ambitious goals and meaningful work.

KEY QUOTES

"When you look for One More opportunities to create new habits, you'll find a clear path to a more blissful life."

"Don't fear change. When you accept your new reality, the most amazing things can happen."

"Great team chemistry produces a multiplier effect. Bad team chemistry will burn your efforts down to the ground."

"Greatness can exist on its own... But smart people know the absolute best results don't happen when greatness exists in a one-person vacuum."

"There is strength in numbers and a common purpose."

"Strategically place your One More multipliers in the places where they'll be the happiest and most productive. And then leave them alone."

- *Equip them* with the tools, support, and feedback to perform at their peak.

One More Discomfort

To achieve something meaningful, you must be willing to do what's inconvenient, uncomfortable, or unpopular. This could mean waking up earlier, learning something new, having hard conversations, or pushing through fear, doubt, or fatigue.

- Anything truly worthwhile—whether it's building a business, improving your health, or deepening a relationship—requires *effort, inconvenience, and sacrifice*.
- Hard-earned victories are more fulfilling. They stretch you, develop your strength, your skills, and your resilience. Ask yourself: What kind of life do I want? What discomfort am I willing to endure to earn it? Then, *embrace it* as part of personal growth and building a life worth living.

One More Level of Leadership

Everyone is a leader in some capacity—whether you're guiding a team, supporting your family, or leading yourself. Great leaders help others to do more than they believed they could.

- Great leadership is about *service, inspiration, and impact*. Before you can lead others, you must first lead yourself. That means staying aligned with your values, showing up consistently, and setting the standard through your actions.

Here are several core leadership principles that apply across different roles:

- *Cast a big vision*. Share a dream that's large enough to include the dreams of those you lead. Let people see how they fit into something bigger, and infect them with your energy and belief. Clearly define what you stand for, and what you stand against.
- *Recognize unique gifts*. Every person has strengths. Identify them, nurture them, connect them to the team's mission, and bring out the best in the entire team.

KEY QUOTES

"Convenience and greatness cannot co-exist. They are diametrically opposed forces."

"Paying the price of inconvenience is no guarantee you'll succeed. But if you don't inconvenience yourself and confront the difficult things in front of you, you'll have no chance at ending up where you want to be in life."

"The test of an organization is... its capacity to make common people achieve uncommon performance."
—Peter F. Drucker

"The best leaders enroll others in their cause. They are evangelists for their dreams."

"As a leader, if you identify these unique gifts in people, you can lead them in a way nobody else can."

- *Praise generously*—both publicly and privately. Celebrate not just results, but also effort, behaviors and consistency that lead to long-term success.

- *Equip people for success*. This includes tools, training, and emotional support, which address 6 key human needs:

  (i) Certainty: The need for stability and predictability.

  (ii) Variety: The need for stimulation and change.

  (iii) Love/Connection: The need to feel cared for and part of something bigger than themselves.

  (iv) Significance: The need to feel important and valued.

  (v) Growth: The need for learning and personal growth.

  (vi) Contribution: The need to give beyond oneself and positively impact others.

- *Lead by example, with heart*. Role-model the standard you expect from others. Believe in and care for people sincerely.

- *Develop new leaders* to lighten your load, strengthen the team, and create a culture of growth so people can own the dream and carry the torch without you.

- *Reinforce key messages* and values to embed them in the culture.

- Admit your flaws and mistakes, and *stay grounded and authentic*.

One More Inner Anchor

To lead a grounded, fulfilled life, you need equanimity—the ability to stay calm, centered, and balanced—especially when life gets chaotic.

- Equanimity is that *quiet strength* you lean on when things don't go as planned. It helps you to manage emotions, make wise decisions, and maintain perspective in the face of stress or setbacks. You'll inevitably face disappointments, failure and loss in life. But, you don't have to be defined by them.

KEY QUOTES

"There are too few leaders in the world today who sell a big enough dream...that captures the hearts, desires, and emotions of everyone they lead."

"The number one job of a leader is to develop new leaders."

"Leadership is not about saying new things to old people, it's about saying old things to new people."

"Between stimulus and response, there is a space. In that space is our power to choose our response. In our response lies our growth and our freedom."
—Victor E. Frankl

Equanimity appears in many faiths and philosophies, from Christianity to Islam, Buddhism and Stoicism. It's also the foundation to all other "One More" principles above. To cultivate equanimity:

- Start with *self-awareness*. Notice your thoughts and emotional patterns without reacting automatically to them.
- *Don't over-identify with pain*. See problems in perspective: you are much more than your worst day or a past mistake.
- *Accept reality as it is*, not as you wish it to be. Let go of the need to control every outcome, release attachments to specific results, and accept that nothing lasts forever.

One More Level of Faith

Faith and prayer are powerful tools for growth, inner peace, and resilience. Faith is what you believe, while prayer is how you act on that belief.

- Ed Mylett's Christian faith has brought him strength, peace and confidence. But this principle applies to anyone—regardless of religion—because it's about the life-changing impact of *believing in something deeply*. When you focus your thoughts and intentions on something positive—like health, love, or success—you're engaging in a form of prayer.
- Faith isn't just spiritual, but also *energetic and scientific*. Science shows that everything, including thoughts and emotions, is made of energy. And, energy is always moving, transforming, and influencing what's around it. So when you pray or speak with conviction, you're releasing that energy into the world, shaping your environment and affecting people and outcomes.

Faith helps you to trust what you cannot yet see. Whatever your beliefs, use faith and prayer intentionally to anchor yourself in meaning and gratitude, and take bold action even with uncertainty.

- *Make prayer a daily habit* to strengthen your sense of purpose and belief. Don't pray for harm, revenge, or anything that goes against love and integrity.

KEY QUOTES

"Equanimity is about finding serenity as you battle the challenges in your life."

"If you let go a little, you'll have a little peace. If you let go a lot, you'll have a lot of peace. If you let go completely, you'll have complete peace."
—Ajahn Chah

"Consciously and subconsciously, you pray more than you realize. You may not always view it as prayer, but your mind's natural tendency is to think about what you want in life. You see them as desires, but in reality, desires are a form of prayer.

"There is an energy that attracts certain things to your life and an energy that also repels things away from you as well...having a good understanding of this concept will serve you well in your life."

"Every area of our lives, especially faith, depends on stepping into the unknown to some degree or another."

- In times of *doubt or tragedy*, draw strength and motivation from your faith, to take action despite uncertainty.

One More Final Chance

Life is finite. We don't know how many chances we'll get, so choose to live each day with urgency and purpose—to connect, live, love, forgive, and contribute—before it's too late.

- Ed Mylett learned this from his father, who struggled with alcoholism for many years. Everything changed when he was given an ultimatum by his wife: change or lose the family. His father chose sobriety and stuck to that decision, one day at a time. One more day of staying clean. One more chance to do the right thing. One more opportunity to serve others. That mindset changed his life—and the lives of many others he mentored.

Make the most of each day and moment like it's your last.

- Ask yourself: How would you show up *if this was your final chance* to love, speak, lead, appreciate, or forgive? Live with urgency and make it count.

- *Start each day afresh*. Every morning, tell yourself: "Today I am reborn." Let go of past failure, guilt, or resentment. Choose to focus on what truly matter now.

- Remember: *it's never too late* to start showing up differently. Whether you're struggling, disconnected, or at rock bottom, just hang on for one more day. Use that time to take one more step, offer one more hug, or extend one more act of grace. Then do it again tomorrow, one more day at a time—because that's all it takes to change your life's trajectory and rewrite your story.

Conclusion and Other Details in the Book

The "One More" philosophy is a powerful one that can transform your identity, habits, relationships, goals, and leadership. All it takes is one more try, one day at a time. This book includes many other

KEY QUOTES

"Wasted time is one of the biggest crimes you can commit against yourself."

"You can't control the end, but you can control the story in between."

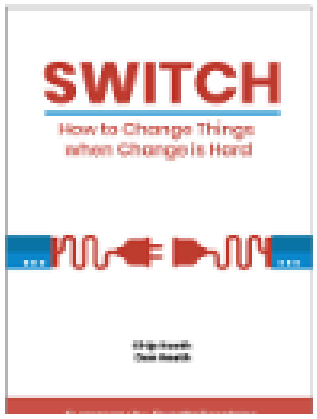
"In your darkest and most challenging times, I know many of you think about quitting and giving up. When those thoughts occur to you, just hold on for One More day."

anecdotes and examples to illustrate the principles and how you can start turning small actions into extra-ordinary results. For more information, visit www.edmylett.com.

About the Author

Ed Mylett is a peak performance expert, speaker, entrepreneur, and author recognized for coaching elite performers from professional athletes to Fortune 500 executives. After building his wealth and leadership experience in financial services, he became a sought-after mentor and podcast host, blending personal growth strategies with high-performance principles.

KEY QUOTES



SWITCH

How to Change Things when Change is Hard

Chip Heath & Dan Heath

The Big "So What"

Making lasting change in our companies, communities and our own can be hard, because of inherent conflict in our minds. This book shows us a 3-part framework that can help us to achieve desired change-at individual, organizational and societal levels–with significant results.

3 Surprises about Change

Change is like trying to get an elephant (with all its inertia) to travel down a new path. To succeed, there are 3 ingredients–the "Rider", the "Elephant" and the "Path"–which must be addressed. These are built on 3 insights about change.

1. What looks like resistance is often a lack of clarity.

Often, people don't change not because they resist it, but they are unsure how to change. For example, "eat heathy" is vague but "go for the 1%-fat milk instead of whole milk" is specific.

To get people to change, give crystal-clear direction.

2. What looks like laziness is often exhaustion.

Our minds are ruled by 2 different and often-conflicting systems- the rational mind (our reflective or conscious system that deliberates, analyzes and plans ahead) and the emotional mind (our instinctive part that feels pain and pleasure).

KEY QUOTES

"This is a book to help you change things. We consider change at every level – individual, organizational, and societal."

"The basic three-part framework we...unpack in this book...can guide you in any situation where you need to change behaviour."

When the 2 systems are in conflict, the emotional mind tends to take over, and it takes a lot of self-control for the rational mind to stay in charge. Self-control or willpower is an exhaustible resource. Each time we try to change things, we are going against what is automatic for us, and this takes willpower. When our self-control is exhausted, we give up.

To change things, appeal to both the rational and emotional minds.

3. What looks like a people problem is often a situation problem.

How do we get people to eat less? Often, we assume that the amount of food people consume has to do with their lifestyle, habits, knowledge about food etc. Yet, according to a study in 2000, people with bigger containers simply ate more food, which means, the key to helping people to eat less can be as simple as giving them smaller containers.

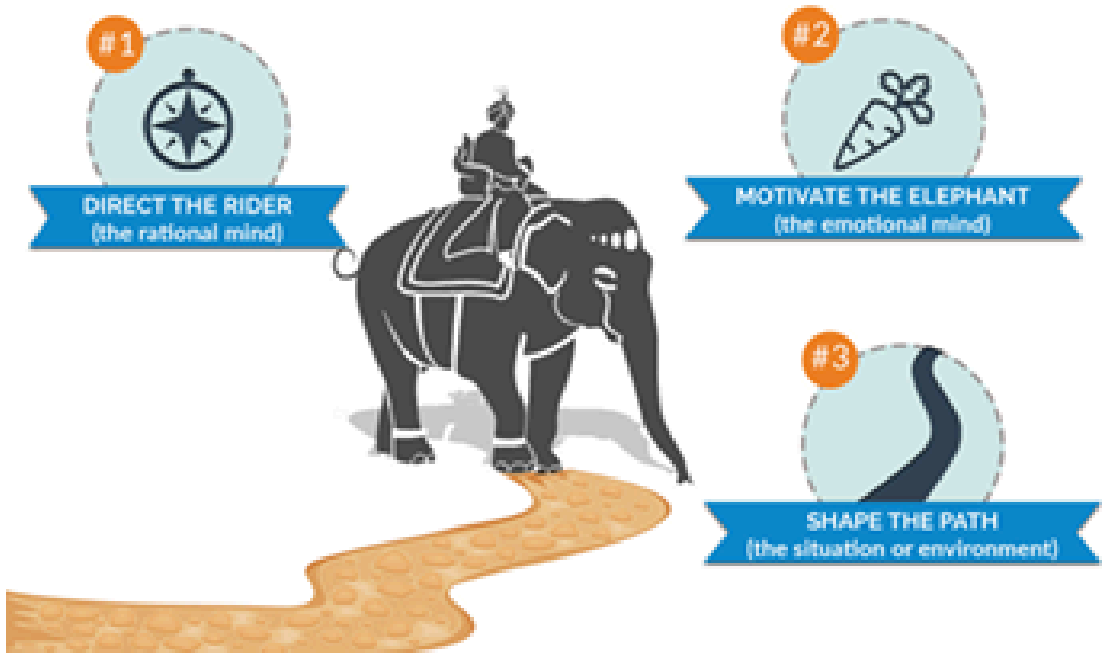
To change someone's behaviour, change that person's situation.

The Rider and the Elephant

Throughout the book, the Heath brothers use the analogy of the "Rider" and "Elephant", by psychologist Jonathan Haidt. The Rider represents our rational side trying to control the massive Elephant which represents our emotional side. The Rider may appear to be in control, but whenever the Rider and Elephant cannot agree on where to go, the Rider eventually loses.

KEY QUOTES

The key to change is to address all 3 elements: The Rider, The Elephant and the Path.



Direct the Rider

The Rider part of our mind has great strengths and an important role to play–it's a thinker, planner, and helps us to chart the path for the future. However, its key weakness is its tendency to over-analyze problems. Hence, the best way for change to take place is to direct the rider. Show him (not just tell him) exactly where to go and what needs to be done.

Find the Bright Spots

Big problems often come with numerous and seemingly overwhelming challenges. Rather than analyze all of them, the best place to start is to look for and focus on exceptions to the problem, i.e. for the first hint of possible miracles. These bright spots can give us an action plan. In short, find the bright spots, analyze them to define the solutions, then clone them.

In tackling the rampant malnourishment issue in Vietnam in the 1990s, Jerry Sternin zoomed in on "bright spot mothers" who managed to raise healthy kids despite the challenging conditions. He looked for small deviations in what they did, and discovered that these mother achieved results through simple cooking and feeding habits that could be emulated by any of the locals. By organizing small community cooking groups where families could come together to practice the solutions, he tackled the Rider, Elephant and Path at the same time.

KEY QUOTES

"The Rider's capacity for analysis is endless. Even success can look like problems to an overactive Rider."

"To make progress on a change, you need ways to direct the Rider. Show him where to go, how to act, what destination to pursue."

"These flashes of success – these bright spots – can illuminate the road map for action and spark the hope that change is possible."

Society generally has a "bad is stronger than good" bias. Of the 24 most common "emotion" words in English, only 6 of them are positive. The newspapers are also full of sensational bad news. To motivate change, we need to shift our Rider from a problem-focus to a solution-focus. Using bright spots help us to do so because they show what's possible.

Script the Critical Moves

When we have more choices and options, we tend to feel overloaded, leading to decision-paralysis. Because change brings new choices, it creates uncertainty and indecision. When faced with decision-paralysis, people stick to the status quo by default.

Hence, in circumstances of change, it is not enough for leaders to set high-level direction. They need to translate ambiguous goals and a broad change idea into concrete and specific behaviors i.e. to script the critical moves.

Point to the Destination

In creating change, it helps to give people a "destination postcard" which shows a vivid picture of what is possible in the near future. This gives a clear idea of where we are heading, taps into feelings that inspire us, and shifts the Rider's focus from over-analysis to answering the question "how do I get to the destination?".

An effective destination postcard should:
1. **Be both specific and worthwhile**
2. **Be aligned with the short-term critical moves**

Motivate the Elephant

Find the Feeling

Often, we assume that people resist change because they don't understand the need for it, hence we instinctively try to teach them or share more information.

Change is not about understanding, but about feeling.

KEY QUOTES

"More options, even good ones, can freeze us and make us retreat to the default plan...This behaviour is not rational, but it is human."

"Big-picture, hands-off leadership isn't likely to work in a change situation, because the hardest part of change – the paralyzing part – is precisely in the details."

"In creating change...we're interested in goals that are closer at hand...We want a goal that can be tackled in months or years, not decades."

"Trying to fight inertia and indifference with analytical arguments is like tossing a fire extinguisher to someone who's drowning. The solution doesn't match the problem."

See-Feel-Change. When it comes to changes, the correct sequence is See-Feel-Change, not Analyze-Think-Change (Kotter & Cohen). Changes bring uncertainty; with so many new variables and new information, people won't think themselves into change. Rather, people change when they see things that cause them to feel for the outcomes that the changes can bring.

The fallacy of self-evaluation. Even if we are presented with all the facts, our evaluation of the situation or ourselves will be inaccurate because our self-evaluation is emotionally biased. We tend to be overly optimistic about where we are at and how we are doing, and these positive illusions hinder our ability to orientate clearly.

Negative vs positive feelings. Negative feelings (e.g. anger, fear, dismay) can be used to motivate quick and specific action. People will usually make a leap when they feel that their circumstances are so dire they have no choice but to do so. However, such negative feelings tend to have a "narrowing effect" on our thoughts. On the other hand, the positive emotion of interest can bring about a different type of change, built on creativity, inspiration and flexibility.

KEY QUOTES

"Change is not one of understanding but one of feeling."

"One reason we're able to believe that we're better-than-average leaders and drivers and spouses and team players is that we're defining those terms in ways that flatter us."

"When we are interested, we want to get involved, to learn new things, to tackle new experiences. We become more open to new ideas."

Shrink the Change

Don't start at the starting line. People are more motivated to be involved in a longer journey that's partially finished, than a shorter journey that's just starting. Motivate action by helping people to feel that they are already on the way to the finish line.

For example, if you want customers to buy 8 additional car washes to get a reward, give them a 10-slot card with 2 "bonus" stamps. This will be more effective than giving them an empty 8-slot card. Make an effort to remind people what's already been achieved, rather than focus solely on what's new and different about the upcoming changes.

"To motivate action...make people feel as though they're already closer to the finish line than they might have thought."

Engineer early success. Break down a daunting task into small parts that are so easy that people can't help but score a victory, i.e. create small wins at an individual level. Once people start on the path, make their progress (however small) visible. This gives people hope, and demystifies the journey.

With each successful step, people will feel the change more, and the change seems progressively smaller compared to their own growth.

Grow Your People

People with fixed mindsets believe that their abilities and potential are fixed based on who they are. People with growth mindsets believe that abilities can be built up with practice, much like muscles, and there's no limit to what they can learn.

Successful change requires people to have a growth mindset. They understand that "failures" are the best way to learn, and they remain flexible and adaptable in face of changing circumstances and new information. During times of change, it is important to constantly remind people that our abilities can be strengthened with practice.

Shape the Path

Most of us are prone to the "fundamental attribution error", i.e. we tend to blame the person and discount the environment. For example, if a driver were to cut into our path, we are more likely to conclude that he/she is a rude or reckless driver, than to consider if he/she is facing an unusual emergency.

How we behave is systematically shaped by the environment or situations we are in. To get people to change, we can provide clear direction, provide motivation and determination, or simply give an easier path or a simpler journey to make.

Tweak the environment

To minimise an undesired outcome (e.g. injury from drunk driving), you can use pre-event intervention (e.g. penalties against drunk driving), event intervention (e.g. seat belts and air bags), and/or post-event interventions (e.g. emergency medical teams).

However, the most effective way to eliminate undesired behaviour is to make that behaviour impossible, e.g. removing unhealthy snacks from the house altogether, or shifting the furniture in a room to change how people interact. Small tweaks in the environment can make a huge difference in shaping behaviours.

KEY QUOTES

"When you engineer early success, what you're really doing is engineering hope. Hope is precious to a change effort. It's Elephant fuel."

"Small targets lead to small victories, and small victories can often trigger a positive spiral of behaviour."

"Failing is often the best way to learn, and because of that, early failure is a kind of necessary investment."

"You know you've got a smart solution when everyone hates it and it still works – and in fact works so well that people's hate turns to enthusiasm."

"Simple tweaks to the Path can lead to dramatic changes in behaviour."

Build habits

Habits are our behavioural autopilots. When we are acting according to our habitual practices, we don't need to exercise or "waste" any willpower. Forming the right habits make our actions seem effortless.

Action triggers are useful for forming new habits quickly e.g. "I will go to the gym after I send Ann to school". By imagining a time and place when we will do something, it has the effect of "preloading" a decision, so we are effectively forming an "instant habit". There's no need to consciously exercise willpower to recommit to our decision or motivate ourselves to do what we should.

Habits that support changes should:
1. Advance the mission
2. Be easy to embrace

Ask yourself: "How can I set up a situation that brings out the good or desired behaviours in these people?" Use checklists to show people what/how to do things, and to avoid blind spots and overconfidence.

Rally the herd

When people feel unsure about what to do, they look to others for cues about how to behave. Hence, groups tend to respond more poorly than individuals, and we tend to subconsciously imitate others' behaviors.

For successful social change, create "free spaces", i.e. small-scale meetings where reformers can gather freely away from the pressures of the dominant groups. This allows them to explore/learn freely, develop a new identity, and prepare themselves for future collective action.

Keep the Switch Going

Change is a process that takes place over time. The secret to successful change is to reinforce each step of the process. It is easier to spot problems than progress, hence noticing and reinforcing progress takes effort.

KEY QUOTES

"When you're leading an Elephant on an unfamiliar path, chances are it's going to follow the herd."

"Change isn't an event; it's a process...To lead a process requires persistence."

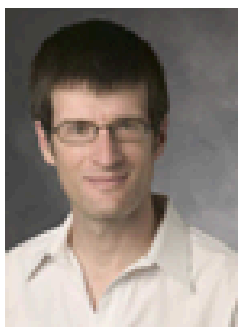
"When change happens, it tends to follow a pattern. We've got to stop ignoring that pattern and start embracing it."

Other Useful Details in the Book to Look Out For

The Heath brothers help to bring their points to life with numerous examples of past research and studies, real-life stories and illustrations, including health and personal change, business turnaround and sales initiatives, government and conservation efforts, social change and family relationships etc.

The book includes sections called "Clinics", to help us think about how to apply the Switch framework, using real-world situations and suggestions on possible game plans. The Heath brothers also list 12 common problems to change and suggest how to tackle them.

About the Authors of Switch



Chip Heath is a professor at Stanford Graduate School of Business, focusing on courses about business strategy and organizations.

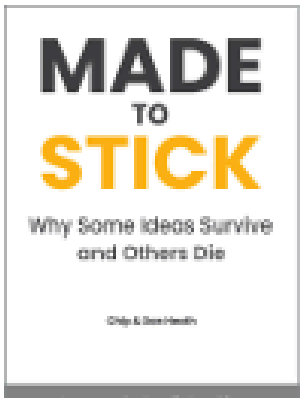
He has consulted with clients such as Google, Gap and The Nature Conservancy.

Dan Heath is a Senior Fellow at Duke University's CASE center, which supports social entrepreneurs. He previously worked as a researcher and case writer for Harvard Business School. In 1997, Dan co-founded an innovative publishing company called Thinkwell, which continues to produce a radically reinvented line of college textbooks. Dan has an MBA from Harvard Business School and a BA from the Plan II Honors Program from the University of Texas at Austin.

Besides this book, the Heath brothers have also co-authored Made to Stick: Why Some ideas Survive and Others Die and Decisive: How to Make Better Decisions in Life and Work. Their books have been translated into 28 languages todate.

For more details, including free resources, you can go to their official website at http://heathbrothers.com/.

KEY QUOTES



MADE TO STICK

Why Some Ideas Survive and Others Die

Chip & Dan Heath

The Big "So What"

Based on 10 years of study, the book answers the question "why do some ideas succeed while others die", and provides a practical and systematic way to create ideas that are understood, remembered, and have a long-term impact.

Introduction

A sticky idea is one that is understandable, memorable, and actually changes perspectives or behaviours. Not all ideas are "stick-worthy", though it is possible to systematically create sticky ideas, or to learn to spot ideas with potential. After studying a wide range of ideas and how they are communicated, the Heath Brothers identified 6 principles (SUCCESs) that can be applied as a template or checklist to shape or test any idea for stickiness. The book also addresses barriers to application and how to overcome them with the SUCCESs principles:

Simple : Find the core of our ideas
Unexpected : Get audience's attention, sustain their interest
Concrete : Make the message clear
Credible : Make people believe our ideas
Emotional : Make people care
Stories : Get people to act

1 Simplicity: Finding the Core

Simplicity is not just about using fewer words, shorter phrases or sound bites. It is about:

- Finding the essential core of our ideas; and
- Sharing it in a form of a compact idea

KEY QUOTES

"We wrote this book to help you make your ideas stick. By "stick" we mean that your ideas are understood and remembered, and have a lasting impact – they change your audience's opinions or behaviours."

"As we pored over hundreds of sticky ideas, we saw, over and over, the same six principles at work"

"The SUCCESs checklist is intended to be a deeply practical tool…It requires diligence and it requires awareness."

Simplicity

"To strip an idea down to its core, we must be masters of exclusion. We must relentless prioritize."

Simple = CORE + COMPACT

For an idea to be compact, there must be a lot of meaning packed into a succinct message, i.e. "a one-sentence statement so profound that an individual could spend a life-time learning to follow it", thereby making an enduring impact, e.g. the proverb "Do unto others as you would have them do unto you."

To create compact communications:

- **Use flags** to tap into existing schemas of your audience
  Schemas are a collection of properties related to a concept, category or object. When we help our audience to tap into their memory terrain or schema of an object (e.g. the colour, size, taste associated with a "grapefruit"), we can teach them an idea without listing all the attributes ourselves.

- **Create a high-concept pitch** to summarize your vision in 1 line
  Use analogies that your target audience understand to call up schemas then adapt it, e.g. "Its Jaws in space!" (Alien) or "We network networks." (Cisco).

- **Use generative analogy** that enrich your ideas
  Generative analogies not only brings understanding to a new concept, they become platforms for new ideas, perspectives, and creations, e.g. Disney using the concept of cast members to describe their employees.

In sharing your core, be careful not to bury the lead, i.e. don't start with something irrelevant but interesting. Instead, focus on making the core message more interesting.

2 Unexpectedness: Getting the Audience's Attention and Sustained Interest

There are 2 parts to this principle:

- Get Attention through the emotion of Surprise
- Keep Attention through the emotion of Interest

Getting attention

Humans adapt quickly and tune out to consistent patterns. Our brains are however alert to changes. Hence, the best way to get someone's attention is to break a pattern.

KEY QUOTES

"The Golden Rule : a one-sentence statement so profound that an individual could spend a lifetime learning to follow it".

"Compact ideas alone aren't valuable - only ideas with profound compactness are valuable. So, to make a profound idea compact, you've got to pack a lot of meaning into a little bit of messaging."

"People are tempted to tell you everything, with perfect accuracy, right up front, when they should be giving you just enough info to be useful, then a little more, then a little more".

Unexpectedness

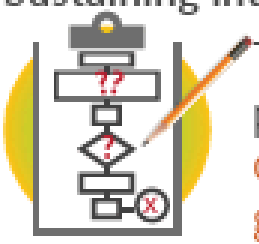
"Unexpectedness, in the service of core principles, can have surprising longevity."

We use our schemas to constantly guess and predict what will happen next and to make decisions. When our "guessing machines" fail, we are surprised, alert and focused on finding the answer to resolve why we are surprised. This is how you can create surprise:

- Identify the key message (the core) you wish to communicate
- Identify what is counterintuitive about the message, or what are the unexpected implications from this message
- Communicate your message in a way that breaks your audience's guessing machines, then help them to refine their machines.

When going for big surprises, be careful to avoid gimmickry. Make sure you help the audience to "fix" their machine at the end by connecting the surprise back to your core message.

Sustaining interest



To create sustained interest, we need to engage people's curiosity, over time, by systematically opening and filling their knowledge gaps. To generate ongoing curiosity:

- Create a mystery: Mysteries come from an unexpected journey (not a momentary surprise) – we want to solve the mystery but are not sure how exactly to do that. Progressively give people information so they start to focus on what they don't know. Give people enough context of the issue so they'd start to care.
- Use the gap theory. Before we tell people the facts, they must realize they need those facts, i.e. we must open gaps before we close them. To help overconfident people (who think they know everything) to recognize a knowledge gap, help them realize that others disagree with them. When creating knowledge gaps, ensure they are not so big that they seem insurmountable.
- Use the news-teaser approach: Ask "what questions do I want my audience to ask?" instead of "what information do I want to convey?" Tease the audience to ask the right question.

3 Concreteness: Making our Ideas Clear

Experts tend to get more abstract because they have so much knowledge, they tend to see the patterns and insights

KEY QUOTES

"The best way to get people's attention is to break their existing schemas directly."

"If you want your ideas to be stickier, you've got to break someone's guessing machine and then fix it."

"Unexpected ideas, by opening a knowledge gap, tease and flirt. They mark a big red X on something that needs to be discovered by does not necessarily tell you how to get there."

"Use the gap theory of curiosity to our advantage. A little bit of mystery goes a long way."

Concreteness

"Naturally sticky ideas are full of concrete images – icefilled bathtubs, apples with razors – because our brains are wired to remember concrete data... Speaking concretely is the only way to ensure that our idea will mean the same thing to everyone in our audience".

between details, rather than the concrete details per se. Abstract ideas are hard to understand and remember, and are open to different interpretation.

- To **help people understand and remember**, we must make our ideas clear and concrete. Give a concrete context and build on what our audience already know and can identify with. An idea is concrete when it brings up sensory information (feelings, smells, sounds etc.)

Our memory works like Velcro with thousands of tiny loops and hooks: build more hooks into the idea to help it stick better in our memory.

- To **help people to coordinate better**, we should create a "universal language" that everyone can speak fluently. When people have the same sensory interpretation of the idea or challenge, it creates a "shared turf" that they can feel comfortable working in together.

4 Credibility: Making People Believe our Ideas

People generally believe ideas under the influence of family, personal experiences, faith, or authorities. However we can also build credibility into our ideas.

External Sources of Credibility

Use authorities and anti-authorities as a great source of credibility – we believe them if they seem honest and trustworthy, with no vested interest to promote the message

Internal Sources of Credibility

Use these tips to build credibility inside the message itself:

- **Use convincing details**: When an idea comes with vivid details that are truthful, relevant to our audience and support our core idea, it makes the idea more tangible, real, and more believable.
- **Use statistics effectively**: Use statistics as inputs to make up your mind on an issue, then share these pivotal statistics to help the audience understand the underlying relationship. Don't make up your mind and look for statistics as outputs to support the claim.

KEY QUOTES

"Trying to teach an abstract principle without concrete foundations is like trying to start a house by building a roof in the air."

"The barrier is simply forgetfulness – we forget that we're slipping into abstractspeak. We forget that other people don't know what we know."

Credibility

"If we're trying to persuade a skeptical audience to believe a new message, the reality is that we're fighting and uphill battle against a lifetime of personal learning and social relationships."

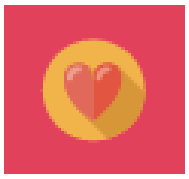
"It can be the honesty and trustworthiness of our sources, not their status, that allows them to act as authorities."

"We need to identify details that are compelling, human, meaningful – details that symbolize and support our core idea."

Apply the human-scale principle when presenting statistics: Use scenarios which people can easily simulate in their minds (e.g. throwing a ball across a football field). This provides scale and context to make the idea more credible.

- **The Sinatra Test**: If one example or testimonial alone can establish credibility in a specific domain, this example passes the Sinatra Test
- **Provide a "testable credential"**: Let customers test a claim or idea for themselves, or "test before they buy"

5 Emotions: Getting People to Care about our Idea



For people to take action, they first have to care. Generally:

- People tend to feel more for one individual than the masses. When a problem seems so big, people care less as they feel that their own contributions are meaningless.
- People feel less when they are presented with statistics, which shift them into an analytical frame of mind.

To make people care:

- **Use associations**: Form an association between something that people care about and something they don't yet care about (your idea). However, when everyone is tapping on the same things that people care about, avoid this turf and find new, unique associations.
- **Appeal to self-interest**: Directly address "what is in it for me" for your audience. The magnitude of the benefits is not always as important as the tangibility of the benefits – It may be adequate to demonstrate modest benefits that people can clearly imagine themselves enjoying.
- **Appeal to identity**: Besides addressing the lower levels of Maslow's hierarchy of needs (self-interest), appeal to the audience's identity and aspirational needs, including their personal and group identities, and who they aspire to become. Ask "why" to remind people of the core values and principles that underlie our ideas.

KEY QUOTES

"Statistics will, and should, almost always be used to illustrate a relationship. It's more important for people to remember the relationships than the number."

Emotions

"If I look at the mass, I will never act. If I look at the one, I will."
- Mother Teresa

"How can we make people care about our ideas? We get them to take off their Analytical Hats. We create empathy for specific individuals. We show how our ideas are associated with things that people already care about. We appeal to their self-interest, but we also appeal to their identities – not only to the people they are right now, but also to the people they would like to be."

6 Stories: Getting People to Act on our Ideas

Stories can be powerful in providing:

- Simulation (knowledge on how to act); and
- Inspiration (motivation to take action)

Simulation: Know how to act

Mentally rehearsing a scenario helps us to perform better in actual situations, because it evokes the same parts of the brain that are used in physical activity. Mental simulation provides as much as 2/3 of the benefits of actual physical practice, and can help us manage emotions, solve problems, and build skills.

When we listen to stories, we tend to simulate it in our heads. By creating stories in rich, comprehensive and life-like scenarios, we help our audience to simulate the idea mentally. This allows them to experience and rehearse the idea from the inside, preparing them to act. According to the Velcro concept, the more hooks we have in our stories, the better they will stick

Motivation : Energy to act

After studying many stories, the Heath brothers identified 3 key plots that motivate action:

The challenging plot: These stories are about overcoming challenges, e.g. include David vs Goliath stories, underdog stories, rags-to-riches stories, winning against the odds etc. They appeal to our sense of persistence, courage, and inspire us to work harder, face challenges and conquer obstacles.

The connection plot: These stories are about relationships among people, e.g. love stories, or people who bridge gaps in religion, class, class, religion etc. They inspire us to be more altruistic, more loving, more tolerant, more collaborative etc.

The creativity plot: These stories are about mental breakthroughs, innovative solutions, or cracking a tough puzzle. They inspire us to think differently, be more creative, and be more adventurous.

KEY QUOTES

Stories
"Stories have the amazing dual power to simulate and to inspire."

"Stories are like flight simulators for the brain."

Springboard stories (with visible goals and barriers) can be used to help people see possibilities. By shifting the audience into a problem-solving mode, we help them to solve the problems for themselves.

Using what Sticks

To get the message across effectively, the SUCCESs principles help you to achieve a few objectives, in 2 stages.

1) The Answer Stage

- Arrive at the idea you want to share → Simplicity

2) The Telling Others Stage

For an idea to stick, it must make the audience:

- Pay attention → Unexpectedness
- Understand and remember it → Concreteness
- Agree / believe → Credibility
- Care → Emotions
- Be able to act on it→ Stories

Making Strategy Stick

Strategy should guide behaviour and drive actions that are aligned with the company's goals, delivers competitive advantage and financial success. Unfortunately, most strategies are academic, and do not drive action. There are several barriers to be overcome:

Barrier 1: The Curse of Knowledge

Executives tend to talk about strategy in abstract. A good way to over come it is to tell stories that are vivid, concrete, and bring to life the company's competitive advantage in day-to-day, on-the-ground terms. Tell the stories in 2 parts - the story itself, and the moral of the story.

Barrier 2: Decision Paralysis

Decision paralysis can set in where there's too much choice (e.g. choosing between innovation vs efficiency) or ambiguity in the situation. Many strategies are not concrete enough for the typical employee to overcome decision paralysis. The solution is to find the core, and translate that into priorities for day-to-day application.

KEY QUOTES

"A strategy is, at its core, a guide to behaviour…A good strategy drives actions that differentiate the company and produce financial success."

"Sadly, there is a villain in our story. The villain is a natural psychological tendency that consistently confounds our ability to create ideas using these principles. Its called the Curse of knowledge".

"The strategy motto is a one-liner that brings clarity to an environment muddied with choices"

Barrier 3: Lack of a Common Language
Often, strategy is shared in an abstract way that employees find hard to communicate back to the leaders. When the strategy is clearly understood by everyone in the company, in the same way, then people can disagree or contribute constructively. To avoid having an inert strategy, build it into the way your organization talks – that way, it cannot be inert, and will in fact help to guide behaviour.

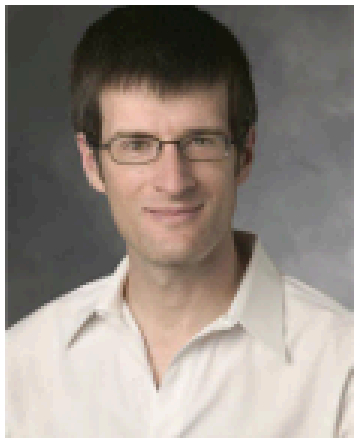
3 principles to making strategy stick:
1. Be concrete
2. Say something unexpected
3. Tell stories

Other Useful Details in the Book to Look Out For

The Heath brothers identified the SUCCESs principles after studying hundreds of case studies. Throughout the book, they share real-life, day-to-day examples that most of us can relate to e.g. urban legends, movies, proverbs and fables, airline flight safety announcements, education, department stores, etc.

They also outline numerous pivotal experiments that demonstrate how humans think and behave. The book also includes Idea Clinics that zoom into specific examples for the reader to model the process of making ideas stickier.

About the Author



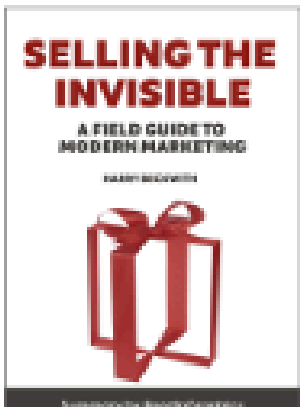
Chip Heath is a professor at Stanford Graduate School of Business, focusing on courses about business strategy and organizations. He has consulted with clients such as Google, Gap and The Nature Conservancy.

Dan Heath is a Senior Fellow at Duke University's CASE center, which supports social entrepreneurs.

KEY QUOTES

"A common strategic language allows everyone to contribute."

"This book is filled with normal people facing normal problems who did amazing things simply by applying these principles (even if they weren't aware that they were doing it)"



SELLING THE INVISIBLE

A Field Guide to Modern Marketing

by Harry Beckwith

The Big "So What"

Many companies, such as McDonalds, Federal Express, American Express, Levi's, are selling services, not products. Services are inherently more invisible than products, and call for a different sales and marketing approach. The book offers more than 100 tips and insights – for business owners, sales or marketing people - on how to sell services effectively.

Introduction

Services are more invisible and intangible than products. Unlike products - which you can touch, see, smell, and taste before purchasing - services (e.g. a haircut) must be purchased before customers get to experience it. It is also harder to put a warranty on a service.

Even if you sell a physical product (e.g. software or shoes), you are likely to be competing on service (through customization, delivery, support etc.). Effective services marketing is more about how you think than what you do.

Getting Started

Before you start marketing your service, **fix your service first.**

- We tend to think we are better than we are – it is better to assume your service is bad, so you force yourself to improve.
- Let your clients (not your industry/ego) set the standards. Don't benchmark within your industry; Benchmark against the best in class e.g. Disney.

KEY QUOTES

"Services are not products, and service marketing is not product marketing."

"This is not a how-to book...this is a how-to-think-about book."

If you're struggling to create a good ad for your service, it's a sign your service is weak and needs fixing.

Get the right focus:

- Always start at zero. Don't focus on "how can we sell this better?" Instead, ask "is this still what the customers want?".
- Sweat the small stuff - tiny actions can create massive impact (The Butterfly Effect).
- Even with outstanding service, mistakes and defects can happen. When they do, these present huge opportunities to win customers over with your service recovery.
- Don't just try to get better. Focus on doing things differently.

Understand the stages of service evolution - get to Stage 3:

- Stage 1: Acceptable standards. Companies offer a product that meets the minimum standards, and customers purchase it because it is the only option available.
- Stage 2: Differentiation. Competitors enter and differentiate themselves, with companies focusing on offering clients the desired products that meet their needs.
- Stage 3: Making the Leap. Most service companies stay in stages 1-2. Stage 3 is where breakthroughs happen - companies make a leap by surprising the customer with the "possible service" that goes beyond customers' expressed needs & expectations.

Surveying & Research

Why survey? People won't tell you what you are doing wrong – not even your best friends. The only way to find out is to ask.

Third party surveys: People may not give you direct feedback, but they will talk behind your back. For more accurate results, get a third party to do your surveys.

KEY QUOTES

"Don't just think better. Think different."

"Every service company must look at stage three; that is where glory, fame, and market share lie."

"Create the possible services; don't just create what the market needs or wants. Create what it would love."

"(A survey) tells you what business you are in, and what people really are buying."

If you're struggling to create a good ad for your service, it's a sign your service is weak and needs fixing.

Get the right focus:

Always start at zero. Don't focus on "how can we sell this better?" Instead, ask "is this still what the customers want?".

Sweat the small stuff - tiny actions can create massive impact (The Butterfly Effect).

Even with outstanding service, mistakes and defects can happen. When they do, these present huge opportunities to win customers over with your service recovery.

Third party surveys: People may not give you direct feedback, but they will talk behind your back. For more accurate results, get a third party to do your surveys.

KEY QUOTES

"Don't just think better. Think different."

"Every service company must look at stage three; that is where glory, fame, and market share lie."

"Create the possible services; don't just create what the market needs or wants. Create what it would love."

"(A survey) tells you what business you are in, and what people really are buying."

Choose oral surveys over written ones. They generally work better because:

- Words like "quality" mean different things to different people. Oral surveys allow you to clarify your questions and/or respondents' answers, to minimize interpretation errors.
- People generally say / share more orally than in writing.
- Better response rate: Only 40% of people respond to a written survey while almost 100% will respond to an oral one.
- A good oral interviewer makes a personal contact with the customer on your behalf.
- The respondent's voice can convey important feelings that written words won't.

Phone vs in-person surveys: People tend to reveal more over the phone than in-person, because they feel less exposed/more anonymous.

What to avoid:

- Asking the question "What don't you like?"
- Using focus groups: You are selling to individuals, so talk to people individually.

Marketing is not a department

Marketing is everyone's business: Everything that the company does is a marketing activity – from messages on the invoice to the receptionist answering a call. Make every employee and activity a part of your marketing efforts.

See the big picture

- Beware of marketing myopia – don't get so lost in daily tasks that you fail to see the broad scope of your businesses.
- Get out there: When people stay in their offices, they end up with a tunnel vision of what they see within the company. What they need to know (customers and prospects) are outside the office. Get out there, get in opportunity's way, and let it hit you.

KEY QUOTES

"For a dozen reasons, conduct oral surveys, not written ones."

"You're selling individually. Talk to individuals."

"Marketing is not a department. It is your business... Every act is a marketing act. Make every employee a marketing person."

"The fastest, cheapest, and best way to market your service is through your employees."

"Most executives are too busy ducking falling trees to see the forest."

- Ask "What am I good at?". When planning your marketing, think of your skills, not just what business you are in.

Services are about relationships

- What business are you really in? In the service industry, you're almost always selling a relationship or an experience, not a product or an expertise (e.g. Rolex isn't in the watch industry, it's in the luxury industry). What are your clients really buying?
- Who is your client? Before you try to satisfy the client, try to understand and satisfy him/her as a person. Know that people crave one thing above all else – appreciation.
- Who is your competitor? In services, your true competitors are often your potential customers, because they can choose to do things themselves, or do nothing at all.
- Success in service marketing is like surviving in high school – talent isn't enough; you must be likeable and popular. To win in the service industry, professionalism isn't enough. You need to be personable.

Adaptation & breakthrough

- Go where others aren't. Rather than fight head-on with competition, serve markets that competitors aren't serving.
- Include technology in your marketing plan.
  1. Have a technology director to identify new technologies that present risks and opportunities for your business.
  2. Ask if you are positioning yourself to be technologically second to none within your industry, across service industries (compared to firms of similar size), and 2 years from now? Are you using technology today to improve your service and grow your business?

Overcoming Planning Fallacies

You can't really predict the future (don't fool yourself), so plan for several possible futures instead.

KEY QUOTES

"Never mind what business you are in – what are you good at?"

"In large part, service marketing is a popularity contest."

"Service businesses are about relationships. Relationships are about feelings."

"Don't approach planning as a precise science. Planning is an imprecise art."

We don't always know what we want. You can get to your "desired destination", only to realize it's not what you really want. Hence:

- Accept the limitations of planning.
- Value planning for the process of thinking, not the results.
- Don't plan your future. Plan your people.

Strategy *isn't* king. Often, tactics drive strategy rather than the other way round. Start doing something/anything, so you can learn from it and shape your thinking/strategy.

Stop trying to build a better mousetrap. Perfect ideas don't work as well as imperfect ideas delivered passionately.

Inaction breeds more inaction: keep moving to succeed.

There's no perfect solution nor perfect timing. Implement a good idea now. Don't procrastinate, don't wait.

Good ideas often sound silly at first. Encourage stupid ideas – they are a healthy part of lateral thinking.

Any idea could fail. Don't kill an idea just because it may fail.

Most of the "truths" that we know about our business, our audience or our company may not be so. Beware of the overconfidence bias and be open to alternative truths.

Every situation is different, so an expert's experience may not always be "right". Don't depend on experts for fail-safe answers.

No research or "facts" can accurately calculate and predict human behaviour. Don't rely on science & data for decisions.

Focus groups tend to focus on today's needs. Don't depend on focus groups to generate ideas for tomorrow.

Common sense is useful, but doesn't create breakthrough ideas.

Our memories are inaccurate and incomplete. Don't do your planning based on memory / what you think you remember.

Our learning from experience comes from inference, and we tend to overgeneralize when we infer. Don't trust everything that experience has taught you.

KEY QUOTES

"Marginal tactics executed passionately almost always will outperform brilliant tactics executed marginally."

"Today's good idea almost always will beat tomorrow's better one... Do it now."

"Too often, the path to perfection leads to procrastination."

"Start failing so you can start succeeding."

"There are no answers, only informed opinions."

"Common sense will only get you so far. For inspiring results, you'll need inspiration."

"Ideas do not follow the good thinking in an organization; ideas follow the power."

Being in a position of authority doesn't make you the best decision-maker. If you're in a position of power, learn to listen. If you're not, learn to question authority.

Companies who succeeded start by believing "it's possible".

How Prospects Think

People make irrational, emotional buying decisions. Don't appeal only to reason.

People choose what is familiar. It's better to be known badly than not be known - people tend to forget the (bad) attributes over time but remember the company. Get familiar to your prospects.

People tend to make decisions based on the most recent data. Get good at your follow up, and/or build on competitors' communications - say something stronger and more effective to secure the business. Leverage on the Recency Effect.

People don't usually evaluate all possible options to make the best choice. They just want to avoid making a bad choice. Show that you are "good enough" - present yourself as good choice, then eliminate all possible concerns that could make you a bad choice.

Remove the fear factor for clients by offering free trials, money-back guarantees etc. Start with a small project or a small slice that people can try out without worry.

People get anchored to their first impressions of you. Identify your first points of contact - the first things you say or the first way you position your service - polish these anchors. Make every other impression you make count. For example , when clients call you, how good is that first call?

Show your weaknesses alongside your strengths, as they make you more believable, honest and trust worthy.

KEY QUOTES

"Familiarity breeds business. Spread your word however you can."

"People do not look to make the superior choice; they want to avoid making a bad choice."

"The best thing you can do for a prospect is eliminate her fear. Offer a trial period or a test project."

"Rather than hide your weaknesses, admit them... Tell the truth. Even if it hurts, it will help."

People need to justify their decisions, and they look for even the smallest differences to do that. Accentuate the trivial differences.

Positioning & Focus

No 2 services are identical – identify or create the differences in your service. Focus on **ONE distinct thing** that will give you a competitive advantage, and position that in your prospect's mind.

- Have 1 simple message that sets you apart from competitors.
- A strong focus rallies your troops, makes your word-of-mouth & elevator pitch more effective and aligns your messages.

The Halo Effect

- Standing for 1 thing doesn't mean you will lose all other appeal, because people will associate that 1 thing with many other things.
- Position yourself as the expert at the hardest task in your service. That special skill should imply you also possess other valuable skills, and position you strongly in other areas.

Closing the gap between your position and positioning statement

- A position is different from a positioning statement:
  1. A position is where you are now in people's minds, based on what they see/ hear/ feel.
  2. A positioning statement is how you wish to be perceived (and what you communicate to influence perceptions). To establish a clear positioning statement, ask these 7 questions:
     - **i.** *Who:* Who are you?
     - **ii.** *What:* What business are you in?
     - **iii.** *For whom:* What people do you serve?
     - **iv.** *What need:* What are the special needs of those you serve?

KEY QUOTES

"You must sacrifice. You cannot be all things to all people."

"The more you say, the less people hear."

"To broaden your appeal, narrow your position."

"Say one positive thing, and you will become associated with many."

"If no prospect can describe your position, you do not have one."

v. *Against whom:* With whom are you competing?
vi. *What's different:* What makes you different from competitors?
vii. *So:* What's the benefit? What unique benefit does a client derive from your service?

- You can't "position" yourself. You can only leverage your current position. To close the gap between your position and your positioning statement:
  1. Keep the steps small so customers can make the leap. Don't confuse your positioning statement with your (internal) BHAGs (Big Hairy Audacious Goals).
  2. Repositioning your competitors: Choose a position that will make your competitors look similar to one another (compared to you). Then, move back toward the middle to close the sale.
- Positioning a small service: Don't try to hide the fact that you are small. Focus on the advantages of being small, e.g. responsiveness and individual attention.

Pricing

Pricing is not necessarily logical – a lower price may make your product second-rate rather than great value.

Apply the resistance principle: If no one complains about your price, it's too low. If almost everyone complains, it's too high.

The low-cost trap: Low prices and good value are not in themselves a positioning – there are almost always a way to beat that price. Focus on improving your service instead.

A high or low price conveys a clear positioning. **Be careful about middle pricing,** because you are competing with almost everyone.

Don't charge by the hour. Charge for knowing the right buttons to press (and the cumulative time you took to develop these skills).

KEY QUOTES

"Don't start by positioning your service. Instead, leverage the position you have."

"In positioning, you have to jump from lily pad to nearby lily pad, one at a time."

"Setting your price is like setting a screw. A little resistance is a good sign."

Naming & Branding

A well-built brand has value.

- It makes selling easier, faster & cheaper: Word of mouth travels more easily, and inquiries are more likely to convert to sales.
- In our "microwave world" where people constantly seek shortcuts, brands are used as a tool for decision making.

Your name should carry **unique, specific, sensory information:**

- Represent your product, not a generic business category.
- Don't use words that describe what everyone already expects (e.g. "creative", "quality").
- The name should imply the service it's intended to serve, and should be unique and sensory.
- Use the "Information-per-Inch Test" to see how much valuable information you are packing into your name. Use colour effectively. Using "Federal Express" as a benchmark, look at what your name and colours are communicating.
- To speed up your brand-building efforts, choose an "unconfusable" name. Many of the big brands (e.g. McKinsey, Harvard, Nike) come with unique names that are not shared by other brands.

A brand acts like a promise and warranty of the service quality that the customer will receive. The best brands keep their promises.

Communicating and Selling

People are interested in themselves, not you. The most compelling sales message is one that focuses on your prospects – what they want, what they need, who they are.

People can only process 1 message at a time. When you say too much, you communicate nothing. The fastest way to improve your sales force is to improve the message, not fix the people.

KEY QUOTES

"In service marketing, almost nothing beats a brand."

"Brands are decision-making shortcuts in a world of people like you looking for shortcuts... As time shrinks, the importance of brands increases."

"Building your brand doesn't take millions. It takes imagination."

"A service is a promise, and building a brand builds your promise...the heart of a service brand...is the integrity of the people behind it."

"Make the services visible, and make the prospect comfortable."

"Meet your market's very first need: Give it one good reason."

Say just 1 thing, then repeat it again and again.

Don't use adjectives. Use stories.

Attack the stereotype your prospect has about you.

Don't say it; Prove it. Use simple, specific, concrete examples. Create evidence of your service quality and communicate it.

Use honesty, not tricks or gimmicks.

Your proficiency isn't as important as the long-term relationship you offer.

You don't need to convey you are superior. You just need to convey you are "positively good".

People trust what they see, not what you say. Watch what you show.

Make the invisible visible. Prospects look for visual clues about the service. Make your services visual so people see who you are. Repeat yourself visually.

Each visual cue you send forms the experience and the client's perception of quality. Be intentional.

To evaluate what someone says, people need to see the speaker. Your marketing needs to have a human face.

When selling something complex, use a metaphor to simplify it.

Use generative words that stimulates the imagination.

Avoid hype and clichés. Get to the point asap - tell people in just 1 sentence why they should buy from you.

To get more publicity, do more advertising. It gives you direct exposure, and creates perceived credibility for editors to want to cover your story.

To get editors to publicize you, give them an interesting story that their readers will want to read. There's always something interesting to share – look harder.

Make sure your service is easy to buy – make the offering and price clear, make it easy to sample and purchase.

KEY QUOTES

"To fix your messengers, fix your message."

"Prospects do not buy how good you are at what you do. They buy how good you are at who you are."

"People will trust their eyes far before they will ever trust your words."

"Service marketers must create the visual surroundings – from the parking lot to the last page of the proposal – that will enhance the client's perception of quality."

"Give your marketing a human face."

"Tell people – in a single compelling sentence – why they should buy from you instead of someone else."

People want to be happy. **Hope always sells.**

Have a good mission statement.

- Mission statements should be specific – they should draw a clear map and include a measurable objective.
- The mission statement must change behaviours in your company – if it doesn't, change the statement.
- Good mission statements are not meant to be part of marketing communications. Have a good statement that states your strategic goal, but keep it private.

Nurturing and Keeping Clients

Relationship accounting. Most service firms start the relationship with their clients on a deficit – the client has taken a risk to engage the firm, and expects the services to be delivered. Manage your relationship balance sheet, and assume it is worse than it seems.

Manage your clients' expectations. Don't raise expectations you cannot meet. Under-promise and over-deliver.

Show appreciation often. Keep thanking. Make every client very happy every day.

Most failures are obvious but successes are not. Make sure you **highlight your successes** and show your clients you have achieved.

Unlike products, most services (e.g. dental services, accounting) are no longer visible once consumed. **Use advertisements** to remind clients that you are still around, and successfully satisfying other clients.

Other details to look out for in the book

The book covers more than 100 tips, each presented in 1-3 pages, with short, simple examples for most "chapters".

KEY QUOTES

"Write a mission statement, but keep it private."

"A customer's satisfaction is the gap between what the customer expects and what she gets."

"Don't expect the client to see how hard you have worked, how much you have cared, and how well you have performed. So often, the client is the last to know."

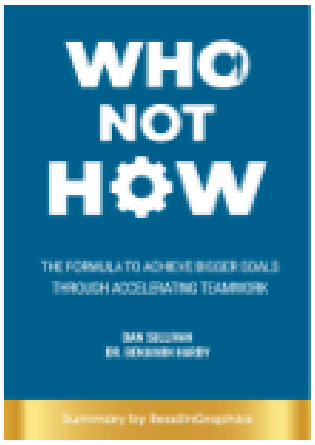
Although the book was written in 1997, many of the examples and ideas are still relevant today. Not all the tips will be relevant or helpful to your organization, but you will almost definitely be able to find useful insights or reminders that you can apply immediately.

About the Author of Selling the Invisible

Harry Beckwith is an author, lecturer, speaker and marketer. He is the founder of Beckwith Partners, a marketing and advertising company located in Minneapolis. He has advised several Fortune 500 companies, and many small and medium-sized service-oriented businesses.

Besides *Selling the Invisible*, he has also authored several books, including *What Clients Love*, *The Invisible Touch*, *You, Inc.*, and *Unthinking*. For more details, visit his website -*www.beckwithpartners.com*

KEY QUOTES



WHO NOT HOW

The Formula to Achieve Bigger Goals Through Accelerating Teamwork

DAN SULLIVAN & DR. BENJAMIN HARDY

The Big "So What"

Entrepreneurs and business leaders often ask the wrong questions and try to do everything themselves. They ask "How can we do this?" or "How do we achieve this goal?" instead of "Who can help us to achieve this?" or "Who can do this for us?" By working with the right people, you can expand your vision, resources and personal growth to achieve dramatically better results.

Introduction

To succeed, you must put in effort and become great at what you do. However, if you try to do everything yourself, you'll end up diluting your energy/focus. The secret to true success and freedom is to focus your energy on the areas that leverage your strengths, creativity, and passions, so you can generate the greatest impact.

When you're stuck with a problem, do you find yourself asking "How can I do this?" This is the actually wrong approach.

- Stop asking questions like "How should I do this?" or "How should I achieve this goal?" When you *focus on "how"*, you're restricted to your finite time, resources, skills and experience.

- Instead, *focus on "who"* by asking "Who can help me to achieve this goal?" or "Who can do this *for me*?" Such questions immediately open up new possibilities that you wouldn't otherwise consider, allowing you to improve your results by 10x or even 100x.

KEY QUOTES

"This is a book about producing bigger and better results in the absolute most effective way possible—in the only way possible."

"The only way to make your present better is by making your future bigger."

"When you're trying to accomplish something challenging or difficult that you've never done before, you probably need a Who."

Adopting the Who-Mindset

The "Who Not How" approach is not about exploiting others. It requires a **fundamental shift** in mindset and approach that positively transforms you and your Whos.

- The core idea is to build a *collaborative network* where each person can offer his/her unique strengths while leveraging others' strengths. Everyone on this "team" is equally valuable regardless of what they offer, and can achieve their personal goals by contributing to the shared vision.

- Every Who needs other Whos. You rely on your Whos for their strengths/resources, while offering your strengths/resources to them in a *symbiotic relationship*. For example:

  (i) This book is the result of the Who Not How approach. Sullivan is the cofounder of an entrepreneurial coaching company. Hardy suggested writing this book after hearing one of Sullivan's talks. Sullivan provided the insights, while Hardy wrote the book and published it with the help of Tucker Max. Hardy and Max were Sullivan's Who for this book, while Sullivan was their Who for expanding their entrepreneurial vision/goals.

  (ii) IBCC Industries, an industrial parts manufacturer, had to relocate its manufacturing from China to India after the USA imposed new tariffs in 2018. By asking "who" questions (e.g. Who can help us to start manufacturing in India? Who can help us to find the ideal location to build our plants? Who can supply good scrap steel in India?), the CEO managed to shift their operations to India in 5 months, and generate >$20 mil revenue from their new plant in 18 months.

Here are the key steps involved in finding the right "Who":

KEY QUOTES

"Every relationship can be viewed as teamwork, directed toward a purpose."
—Buddha

- *Get clear on what you want*. Define a clear, non-negotiable vision. You can download Dan Sullivan's 1-page Impact Filter to crystallize your goals, including:

  (i) The *project focus*:

  - Your purpose: what you want to accomplish and why.
  - The significance or impact of the project.
  - The ideal outcome or what the completed project looks like.

  (ii) *Why you should take action*: Define the best-case scenario if you take action, and the worst-case scenario if you don't. You must sell the vision to yourself before you can sell it to others.

  (iii) *The success criteria*, i.e. what must be true for this project to be considered "done".

- *Communicate your vision widely*. The more you share your Impact Filter, the more you'll crystallize your vision.

  - *Ask "who can help me to achieve this?"* When you're crystal-clear on your vision and ideal Whos, the right people will find you. Remember: there are unlimited talents out there. You're looking for someone who (i) loves to do what you can't or don't want to do, and (ii) will achieve their goals by achieving yours.

  - Once you've found your Who, focus on *engaging and supporting them* to realize the shared vision. Don't micromanage or dictate how things must be done. Give them the freedom to determine how to achieve the desired end-results.

In the next sections, you'll learn how you can embrace this philosophy to earn your freedom, and enjoy more time, more money, better relationships and a greater sense of purpose.

Gain the Freedom of Time

Each of us has only 24 hours a day. How well you master your time determines how much you can accomplish. In order to do

KEY QUOTES

"Your vision helps your Whos, and, in turn, you become their Who, helping them achieve their vision and goals with you."

"Only once you give yourself permission to stop trying to do it all, to stop saying yes to everyone, can you make your highest contribution toward the things that really matter."
—Greg McKeown

what you love and are great at, spend less time on the things you hate or are bad at, and tap on others' strengths/resources.

"Whos" allow you to expand exponentially

"Whos" allow you to get drastically better results.

- When you ask "how" questions, you're limited by your own knowledge/capabilities and your finite time/attention. When you do everything yourself, your progress is *linear* since you have no time/energy to expand your vision.

- When you ask "who" questions, you can grow your results *exponentially* because you can: (i) connect to new insights, knowledge, resources, and skills, (ii) partner with people who can achieve more results with less time/resources, (iii) have multiple Whos (who in turn have multiple Whos), and (iv) free up your own time to focus on more impactful tasks.

"Whos" allow you to expand as a person. Every human being has an innate desire to grow. A Who-mindset is about developing 2-way relationships for mutual learning and growth.

- When we partner with others, we gain both material resources (e.g. money, networks) and non-material resources (e.g. time, insights, encouragement). This *expands our efficacy* or our potential to produce desired results. For example, if you want to improve your fitness, it's more effective to engage a personal trainer (who can offer coaching and support) instead of just buying a gym membership.

- Seek to unlock your "*Transforming Self*", which is the highest level of psychological development according to psychologist Dr. Robert Kegan:

  (i) The *Socializing Self* acts from fear, and does things to conform or gain approval from others.

  (ii) The *Authoring Self* has an independent worldview, but is blind to personal biases and is stuck with a narrow perspective.

KEY QUOTES

"What is the ultimate quantification of success? For me, it's not how much time you spend doing what you love. It's how little time you spend doing what you hate."
—Casey Neistat

"'Who' expands your vision for what is possible, because you no longer see yourself as the sole means of achieving the result."

"Who Not How is about utilizing relationships, and being transformed by them."

"Resources not only expand your ability to produce results, but can have a transformational effect on you as a person—on your identity, worldview, and skill level."

(iii) The *Transforming Self* has independent views, beliefs and goals. At the same time, you forge collaborative relationships to learn, grow and expand your perspectives/self-image. This unlocks synergy where the whole is greater than the sum of its parts.

"Whos" help you to overcome procrastination

Most people spend the bulk of their lives putting off important things. The more you procrastinate, the more you lose confidence in yourself and limit your own potential. Whos give you the confidence and energy to break the inertia.

- Procrastination usually sets in when we *lack the confidence* to do something. The more we put things off, the less confident (and more guilty) we feel, and the more we procrastinate. Eventually, we develop a negative self-image that narrows our ambition and possibilities.

- Procrastination is actually *a form of wisdom*, since it signals that you lack something to start on an important task. If you fret over *how* to do it, you'll just keep going in circles. Once you ask "*who* can help me to do this?" you'll suddenly feel relieved and energized to seek out people with the time, connections, skills and knowledge to address your problem.

However, people will only want to collaborate with you if they believe in your vision and how you can help them. That's why it's crucial to crystallize your vision and commit to your goals *before* you try to enroll others. Define the "whats" and "whys", then let your Whos define and execute their Hows.

You can find the right Whos in all aspects of your life, from your work/business to your health, interests, and relationships.

- In fact, you're already surrounded by Whos. Just think of the people you rely on daily, e.g. the postman, cab-driver, your kids' teachers, etc. You're also a Who to your spouse, friends, children, colleagues, and customers. How could your life improve if you *increase the number and quality of Whos* around you?

KEY QUOTES

"Procrastination is a psychological phenomenon that occurs when you really want something more for yourself, but you lack the knowledge and capability to do it."

"You can have everything in life you want, if you will just help other people get what they want."

"Your life is filled with Whos that serve specific and unique roles, enabling you to be and do what you otherwise could not."

- Use *quarterly cycles* to add Whos and improve your results. Every 90 days:

  (i) Reflect on your top achievements in the past 90 days and what you're the most confident of.

  (ii) Identify and eliminate the tasks that drain/distract you from your high-impact activities.

  (iii) For the next 90 days, identify 5 projects that you're excited about *and* confident of making progress in. Crystallize your goals for those areas, then ask "Who can help me to achieve this?" Add at least 1 Who to help you in your 90-day goals.

Gain the Freedom of Money

With more Whos working on your goals, you'll have more time to focus on the things that you're good at. This allows you to increase your earning capacity and eventually attain the Freedom of Money (i.e. having enough money to solve most problems).

Time is Money

There are 2 types of problems in business:

- *Technical problems* refer to issues where you already know the answer and just need a way to get there (e.g. setting up a blog page). You can learn how to do it yourself, but it's better to find someone who (i) can do it better/faster and (ii) wants to do it. This solves your problem while giving the other person a desired opportunity.

- *Adaptive problems* refer to issues without a known answer. This is where you come in as the Who—to set the direction and act as the creator/innovator. These are the high-payoff activities which only you can solve with your vision, knowledge, and expertise.

Each of us has a finite amount of energy and attention. Every time you think about an issue or make a decision (however

KEY QUOTES

"You have to work less to make more money."

"Delegate everything except genius."

minor), you're depleting your reserves, until you end up with "decision fatigue". The key is to progressively delegate the unproductive activities so you free yourself up for creative, high-impact work.

- When you're not bogged down by the Hows, you can use the time/energy to prepare for important events (e.g. an important speech or presentation). You're also more likely to *get in "flow"*, which is a peak-performance state where you can push your boundaries effortlessly and expand your skills and results.

- The more time you free up for high-impact activities, the more money you'll earn, allowing you to get more Whos and resources in a *virtuous cycle*. Imagine what it's like to have a Who to handle every aspect of your life (including someone to hire/find other Whos), so you can focus on the most rewarding activities that you love. For example, you may start by investing $500 for someone to edit and post your podcasts online while you focus on developing quality content. As your traffic and revenue increase, you can invest more into marketing your podcasts, and even offer bonuses for achieving certain targets.

Adopt an investment-mindset, not a cost-mindset: (i) see each Who in terms of the potential value and personal growth they can bring, (ii) think strategically (instead of focusing on short-term transactions), and (iii) seek win-win opportunities (instead of worrying about what you may lose).

- The right Whos will *multiply your results*, grow your vision and open the door to new possibilities. For example, if you're the CEO of a company, it makes more sense to invest $2,000 to have someone build your website than to try and do it yourself. Investing $150,000 in a good sales manager is also well worth it if he can bring in $1.5 mil more revenue each year.

Invest in your Vision and your Whos

The Pygmalion Effect refers to people's tendency to rise or fall to the standards that others expect of them. When you invest in your vision and surround yourself with people who're passionate about your goals, you'll push yourself to

KEY QUOTES

"Only those who value their time can become increasingly free in the realm of money."

"Until you free up your time, your mind will be caged. When you free up your time, you free up your mind."

"Whos, when selected properly to fit within your vision, are never a cost. Whos are an investment."

"Every time you invest yourself in something, you become more committed to it."

live up to their expectations and achieve real results. In the process, you become more committed and confident, making it easier to attract even more Whos. Likewise, your team members will also become more confident and committed each time they overcome obstacles to move closer to the goal/vision.

Delegate and engage people effectively.

- The *Self-Determination Theory* says that every human being is motivated by 3 psychological needs: competence, autonomy, and positive/meaningful relationships. By creating an environment that fulfill these needs, you can unlock your team's intrinsic motivation and increase their performance.

- *Focus on the end-results* instead of micro-managing the process. Give your Whos the flexibility and autonomy to decide on the Hows. Focus your energy on upholding high standards, and on providing clarity and encouragement. Transformational leaders invest in their people in 4 ways:

  (i) They provide *individualized consideration* by valuing each person's unique contribution, listening for their needs/concerns, and offering empathy and support.

  (ii) They offer *intellectual stimulation*, creativity and learning by challenging assumptions, inviting inputs, taking risks, and encouraging their team to do the same.

  (iii) They provide *inspiration* by articulating a motivating and meaningful vision, challenging people to raise their standards, and building a sense of purpose and optimism.

  (iv) They *role model* ethical behaviors to earn the trust and respect of their followers, such that people want to learn, grow, and support them to achieve their vision.

- However, autonomy without clarity or feedback will only create confusion and chaos. To *delegate effectively*, you need 3 ingredients:

  (i) *Goal clarity*: provide a clear vision, define what "done" looks like, and set clear boundaries;

KEY QUOTES

"Support is attracted to purpose."

"Treat your employees as an investment, not a cost."

"You define the vision, find the Who or Whos, and let them create the result."

"The most useful thing you can do for other people is appreciate their value."

"Autonomy without clarity is ultimately a disaster."

(ii) *Autonomy*: let people decide how to achieve the goal; and

(iii) *Regular feedback*: provide direction/inputs where needed.

Gain the Freedom of Relationships

As you grow your Time and Money Freedoms, you'll meet world-class mentors and collaborators who can bring you and your products/services to even greater heights. You'll also have the flexibility to connect/partner with people you *want* to build relationships with.

Be a good "Who" to others first

Create value first. Transformational relationships only work if all parties are willing to ask "What's in it for *them*?" instead of "What's in it for me?" Before you approach someone, learn what they value or care about, and if/how you could help them to accomplish what they want. Only forge relationships if you have something concrete and meaningful to contribute. Ultimately, you want to work with people whose objectives can be met by helping you to achieve your vision.

Continually add value to others to build the relationship.

- Give generously and find ways to add value through *growth/service*. Seek to expand the pie for all parties involved. Don't focus on status or external rewards, or you'll lose the motivation to maintain the relationship once you reach a certain level of success or extract what you want from the relationship.

- If you're not used to connecting at that level, start by *volunteering* your time/services without expectation of reward.

Express gratitude regularly. All human beings want to feel appreciated. When you sincerely appreciate the people around you, (i) you'll feel happier and humbler, (ii) others

KEY QUOTES

"When the student is ready, the teacher will appear."
—Buddha

"Don't reach out to someone unless you have something meaningful to offer them."

"If you're useful, and continue being generous, the world will be very good to you."

"Gratitude attracts and creates abundance."

want to be around you, and (iii) you'll attract more Whos into your life.

Go for an ideal fit

Invest in relationships that have a good fit. Only connect with people you *want* to connect with. Ask yourself "How do I feel when I'm with this person?" The right people allow you to be who you are, and to become who you aspire to be. If a relationship is a chore, then let it go no matter how "successful" that person seems.

Be willing to say "no" to people who aren't aligned with your goals. If a client is disrespectful, condescending, and insists on dictating the tasks of everyone on your team, let him go even if he's worth millions of dollars. Only work with people who're excited about your vision and can share an open, positive relationship with you.

- Always *be the buyer*, not the seller. Get crystal-clear about your vision, future self, and priorities, and only engage in relationships that are aligned with that desired future. As you gain more freedom of time and money, you'll have more options and will no longer tolerate the people or things that you used to tolerate.

- Keep *increasing the quality* of people in your life to increase your confidence and likelihood of creating your desired future. Look back at yourself 5 or 10 years agoo: How have your preferences, attitudes and priorities changed? What do you no longer tolerate?

Collaborate effectively

An effective team will always outperform an individual, no matter how brilliant he/she is. Even Tiger Woods—a golf superstar—needs the support of his coaches and caddy.

Be open to others' ideas and suggestions. No matter how smart you are, your views and knowledge will always be limited. Combine your ideas, skills and perspectives with others to expand your possibilities and results exponentially.

KEY QUOTES

"When finding Whos, don't settle...Find Whos that fit."

"I don't want to work on a relationship. I just want a relationship that works."
—Dan Sullivan

"You get in life what you tolerate."

"Your ability to succeed is based on the quality of the people in your life."

"No matter how brilliant your mind or strategy, if you're playing a solo game, you'll always lose out to a team."
—Reid Hoffman

Create rapid feedback loops with the 80% rule.

- Don't try to perfect a plan on your own. It's much better to throw out your raw ideas or drafts to your team for *feedback*.
- Do what you can as the Who, the *pass it on to the next Who*. The last 20% of a project can be the most time-consuming. So, aim to reach 80% quickly (e.g. an initial draft), then get feedback from others, identify what's required to move it to 100%, and get the right Who to bring it to the next level.
- Don't let the desire for perfection hold you back from *completing a project*. Define the criteria for "done", celebrate a project when it's done and move on.

Aim to be a hero to your team members and collaborators. This will motivate you to put in your best effort and achieve your best results. Likewise, allow others to be your hero—ask for help once you're stuck. When you open up, you release the pent-up emotions blocking your creative insights, and can get fresh ideas and perspectives.

Gain the Freedom of Purpose

Each time you add a Who with complementary strengths/resources and fresh perspectives, you address your gaps/weaknesses, free up your time/energy for what matters most, expand your vision, and increase your freedom of time, money and relationships. You become truly free to pursue your dreams instead of getting stuck in the daily grind.

Collaborate, don't compete

Shift from a mindset of scarcity to abundance. When you compete with others, you're pitting your finite strengths/resources against theirs. When you collaborate, you're adding others' strengths/resources to yours. This (i) increases your chances and levels of success, (ii) creates a deeper sense of meaning and belonging, and (iii) helps you to

KEY QUOTES

"Entrepreneurs base their lives on results. It's not about time or effort."

"Done is better than perfect."

"In the world of business and life, collaboration is the name of the game."

value others' contributions (instead over-valuing your own contributions).

Your identity, purpose and goals are shaped by your experiences and the people around you. Find the right Whos that broaden your vision and sense of purpose.

- British authors J. R. R. Tolkien and C. S. Lewis rocked the fantasy genre in the 20th century with their respective books *The Lord of the Rings* and *Chronicles of Narnia*. Without the authors' mutual support and encouragement, both books may not have been published.

  (i) Tolkien met Lewis while teaching at Oxford University. They shared a common interest in Norse mythology and formed a literary group that met regularly.

  (ii) Tolkien had been working on a poem for 4 years before he asked Lewis to review it. Lewis' praises, feedback and encouragement were instrumental to Tolkien's progress with *The Lord of the Rings*.

  (iii) In the meantime, Tolkien and a common friend prodded Lewis to return to his Christian faith, which had a huge influence on the *Chronicles of Narnia series*.

Conclusion & Other Details in the Book

How far do you wish to achieve the freedom of time, money, relationship and purpose? Whose hero do you wish to be? Your level of success, impact and freedom will be directly proportional to how far you commit to and apply the points outlined above. Start by:

- Setting a bigger goal or vision for the future;
- Asking "Who can help me to do this?"; and
- Repeating the process for all aspects of your life.

The book also includes many real-life stories of famous people and entrepreneurs coached by Dan Sullivan. For more details, support and resources (including the free

THE WHOLE-BRAIN CHILD

Revolutionary Strategies to Nurture
Your Child's Developing Mind

Daniel J. Siegel & Tina Payne Bryson

The Big "So What"

When your child melts down or explodes with emotion, it's not about defiance—it's their brain struggling to cope. In *The Whole-Brain Child*, Daniel Siegel and Tina Payne Bryson explain how your child's brain works and develops, how everyday interactions shape that development, and how you can use 12 science-backed strategies to raise calmer, more resilient kids who feel secure, connected, and capable of thriving.

Introduction: What is Whole-Brain Parenting?

Most parenting advice focuses on managing children's behavior. However, lasting change begins with **brain development**—it affects everything from emotional management to decision-making, learning and relationships.

- The brain is constantly changing through experience—a process called *neuroplasticity*. Each time your child laughs, cries, solves a problem, or gets comforted, tiny brain cells called neurons send signals to each other. The more often mental pathways are activated, the stronger the connections grow. Over time, repeated experiences "rewire" the brain, forming default patterns that shape future reactions and behaviors.

- Every interaction you have with your child literally *shapes the architecture of their brain*, thereby shaping their emotions, thinking, and responses for years to come.

The brain isn't a single system. It has **different parts** that handle different jobs:

- The *left brain* is logical and organized;

- The *right brain* is emotional and intuitive;

KEY QUOTES

"In the following pages we explain the whole-brain perspective and give you a variety of strategies to help your children be happier, healthier, and more fully themselves."

"By understanding a few simple and easy-to-master basics about how the brain works, you'll be able to better understand your child, respond more effectively to difficult situations, and build a foundation for social, emotional, and mental health."

"You can use all of the interactions you share—the stressful, angry ones as well as the miraculous, adorable ones—as opportunities to help them become the responsible, caring, capable people you want them to be."

- The *lower brain* handles instinctive reactions; and
- The *upper brain* handles reasoning and empathy.

These parts often operate in conflict, especially when kids are overwhelmed. That's why a child can seem rational one moment and lose control the next. The key to healthy development lies in an **integrated brain**—getting different brain parts to work together.

- Children with well-integrated brains can regulate emotions, make better decisions, build stronger relationships, and thrive academically and socially. Disconnected brains lead to chaotic or rigid behavior, such as tantrums, shutdowns, or defiance.
- *Whole-brain parenting* facilitates whole-brain integration by:
  (i) Creating opportunities for the child to engage different parts of their brain; and
  (ii) Helping those parts to connect and work in harmony.
- In this summary we'll present these concepts in *2 parts*:
  (i) Integrating the Different Parts of the Brain; and
  (ii) Developing Mindsight

Part 1: Integrating the Different Parts of the Brain

There are 4 parts of the brain that must be integrated for a child to thrive: the left and right hemispheres and the top and bottom brain.

Horizontal Integration: Left and Right Brain

The brain has **2 hemispheres**, each with distinct roles:

- The *left brain* is logical, literal, and linear. It focuses on order, language, and cause-effect reasoning.
- The *right brain* is emotional, holistic, and nonverbal. It processes feelings, images, memories, and nonverbal cues such as facial expressions, body language, and tone of voice.

KEY QUOTES

"Integration takes the distinct parts of your brain and helps them work together as a whole."

"Whether you're a parent or other committed caregiver in a child's life, your ultimate goal is to raise kids in a way that lets them thrive."

"Whether you're a parent or other committed caregiver in a child's life, your ultimate goal is to raise kids in a way that lets them thrive."

- *Young children* (especially those <3 years old) are right-brain dominant—they live in the present moment and often express themselves through emotions, not logic. As they grow and start asking "Why?" questions, it's a sign that their left brain is developing—because the left brain likes to understand how things work and to use language to express that logic.

For kids to thrive, both sides of their brain must work together—a process called **horizontal integration**. This is facilitated by the corpus callosum, a bundle of fibers connecting the two sides of the brain.

- *When integration is weak*:
  - Right-brain dominance can lead to emotional flooding, such as chaotic meltdowns, anxiety, or irrational behavior.
  - Left-brain dominance can lead to emotional suppression. Kids may take things too literally, shut down, or claim "I don't care" even when they clearly do.
- There are *2 whole-brain strategies* for horizontal integration:
  (i) Connect emotionally, then guide rationally; and
  (ii) Name emotions to tame them.

Connect emotionally, then guide rationally. When kids are emotionally overwhelmed, their right brain takes over and their left brain is temporarily "offline." In this state, logical reasoning won't work, and harsh demands can make things worse.

- Instead, start with *emotional attunement*. Engage the right brain using (i) empathy (e.g. "That sounds really frustrating") and (ii) non-verbal cues (e.g. eye contact, a calm tone, gentle touches). Help the child feel safe and understood.
- Once they're calm and the *left brain is back online*, you can move to logic, problem-solving, or setting boundaries.
- For *example*, if your child is upset about a sibling getting better treatment, don't start with a logical explanation about fairness. Instead, validate their feelings, e.g. "It feels unfair sometimes, doesn't it?" Form a right-to-right connection, calm them down, then move into logic.

KEY QUOTES

"By helping our kids connect left and right, we give them a better chance of avoiding the banks of chaos and rigidity, and of living in the flexible current of mental health and happiness."

"An emotional desert, where feelings and the right brain are ignored or denied, is no healthier than a flood."

"Using only the right or left brain would be like trying to swim using only one arm."

"When a child is upset, logic often won't work until we have responded to the right brain's emotional needs."

"No matter how nonsensical and frustrating our child's feelings may seem to us, they are real and important to our child. It's vital that we treat them as such in our response."

- Similarly, if a child is dysregulated due to *hunger, exhaustion or overstimulation*, soothe and settle them first before trying to discipline or reason with them.

Name emotions to tame them. When children are scared or upset, their right brain gets flooded with big emotions. Help them to retell the story and put words to those feelings—because this engages their left brain, restores order and helps them make sense of what happened.

- In short, *storytelling connects both sides of the brain*, helping kids understand their feelings, process difficult experiences, and regain a sense of control.

- For *example*, 9-year-old Bella developed a fear of flushing the toilet after it overflowed. Her father helped her retell the story, including what happened and how she felt. With each retelling, the fear lost its grip, and she eventually overcame it.

- Here are several *tips to help your child re-tell their story*:

  (i) You can start the first line, then let them fill in the details.

  (ii) Let them lead the storytelling, using simple questions to help them piece together events and name their emotions.

  (iii) If they're not ready to talk, give them space to relax or encourage them to express themselves by drawing or playing. Avoid direct interrogation as they may simply shut down.

Horizontal integration applies to parents too. Right-brain dominant parents may overreact emotionally, while left-brain dominant parents may become overly rigid and miss emotional connections. Parents with integrated brains can **role-model** how to respond with both empathy and structure, setting boundaries while staying emotionally connected.

Vertical Integration: Top and Bottom Brain

To thrive, kids also need integration between the **top and bottom parts of the brain**. Think of the brain like a two-story house:

- The *downstairs brain* includes the brain stem and limbic system. It controls basic survival functions (e.g. breathing,

KEY QUOTES

"Reject their generic claims, incidental complaints, and fluffy promises. Instead, anchor them toward the life they already lead and the actions they're already taking."

"Don't underestimate the power of a story to hold a child's attention."

"Integrating and cultivating your own brain is one of the most loving and generous gifts you can give your children."

"Integration allows for a free flow between the lower and higher parts of our brain. It helps build the stairway, so that all the different parts of our brain can be coordinated and work together as a whole."

reflexes), instincts (e.g. fight, flight, or freeze), and strong emotions. It reacts instantly to perceived threats.

- The *upstairs brain*, mainly the cerebral cortex, handles more complex skills like decision-making, planning, empathy, self-awareness, and emotional regulation. However, when a child is overwhelmed, the downstairs brain can hijack the upstairs brain. It's like a baby gate slamming shut, cutting off access to the upstairs brain, leaving children stuck in emotional reactivity.

Not all **tantrums** are the same.

- An *upstairs tantrum* is calculated and intentional, like a child who screams to get a toy in a store, but stops instantly when presented with consequences. In this case, you should stay calm, acknowledge their feelings, but enforce clear limits, e.g., "I know you want the toy, but it's not okay to scream. If you don't stop, we will go home."

- A *downstairs tantrum* comes from true emotional overwhelm, like a toddler struggling in the bath out of fear of getting water in their eyes. Here, you should sooth the child first. Help them calm down, then gently talk about their behavior. For example: "I know you were upset about the water. But it's not ok to hit others. Next time, say, "I don't like that. Please stop."

For kids to manage emotions and make thoughtful choices, the upper and lower brains must be **vertically integrated**.

- *Children struggle with control and reasoning* because:

  (i) The upstairs brain isn't fully developed until their mid-20s.

  (ii) When the amygdala—the brain's alarm system—detects a threat, it can shut down access to the upstairs brain, leaving the child stuck in a reactive state.

- There are *3 whole-brain strategies for vertical integration*:

  (i) Engage the thinking brain, not instincts;

  (ii) Build thinking skills through practice; and

  (iii) Use movement to calm the brain.

KEY QUOTES

"A child whose upstairs brain is properly functioning will demonstrate some of the most important characteristics of a mature and healthy human being."

"A parent who recognizes an upstairs tantrum is left with one clear response: never negotiate with a terrorist."

"Whereas a child throwing an upstairs tantrum needs a parent to quickly set firm boundaries, an appropriate response to a downstairs tantrum is much more nurturing and comforting."

"A parent's goal should be to help build and reinforce the metaphorical stairway that connects the child's upper and lower brain so that the two can work as a team."

Engage the thinking brain, not the instincts. When a child misbehaves, how you react matters.

- Commands or ultimatums can enrage the downstairs brain to trigger more reactivity. Instead, *engage the upstairs brain* by offering choices, asking questions, or guiding them in problem-solving.
- Rather than say, "No dessert and that's final!" try saying, "You can have 1 bite of ice-cream if you finish half the pasta first."
- In some situations, there's no room for negotiation. But where possible, guide your child toward thoughtful decision-making.

Build thinking skills through practice. Like muscles, the brain strengthens with use. Encourage kids to use their upstairs brains regularly, to grow their capacity for reasoning, decision-making, and self-control.

- Let them make *age-appropriate choices* (e.g. choose their outfits, manage their schedules) and face the consequences of their choices.
- Teach them *self-regulation techniques* like deep breathing, counting to 10, or using words to express emotions.
- Ask *reflective questions* like: "Why do you feel that way?" or "What could you do differently next time?" Encourage activities like journaling or drawing, to help process thoughts or emotions.
- Nurture empathy by helping them to *tune in to others' emotions*, e.g. "How do you think your friend feels?"
- Promote *moral reasoning* by discussing ethical dilemmas, e.g. "Is it okay to lie to protect someone?" Model the behavior you want them to learn.

Use movement to calm the brain. Physical movement affects brain chemistry, calms the nervous system, and allows the upstairs brain to come back online.

- When emotions run high, *encourage your child to move* through play, sports, or physical activities like jumping or biking. Once they reset the body, they'll feel calmer and more focused.

KEY QUOTES

"Every time we say 'Convince me' or 'Come up with a solution that works for both of us,' we give our kids the chance to practice problem solving and decision making."

"The upstairs brain is like a muscle: when it gets used, it develops, gets stronger, and performs better."

"Let your children wrestle with the decision and live with the consequences."

"The more your kids think about what's going on within themselves, the more they will develop the ability to understand and respond to what's going on in the worlds within and around them."

"The next time your children need help calming down or regaining control, look for ways to get them moving."

An amygdala hijack can happen to both kids and adults. **Even the best parents lose control**.

- *If you feel yourself reaching a boiling point, stop* before you say/do something you regret. Close your mouth, step away and calm down first. Let your child know you need a moment, then breathe, stretch, or move around to regain balance.

- *Reconnect and make repairs* once you're ready. Apologize if needed, take ownership, and rebuild trust and safety in the relationship.

Memory Integration: Explicit and Implicit

Understand how memory works, so you can help kids to deal with difficult experiences, and make sense of their past in a way that supports emotional well-being.

- Our memories aren't stored as perfect records in mental filing cabinets. Instead, *the brain works through associations*, linking past and present experiences —often without our awareness

- *Each time we recall a memory, we alter it slightly* based on our current emotions, beliefs, and context. That's why two people may remember the same event differently.

Memories are stored in **two forms**:

- *Implicit memory* is unconscious. It influences our feelings and behaviors without us realizing it. For example, a child who had a scary swimming lesson might later feel anxious around pools without knowing why.

  - These memories begin forming even before birth and are shaped by *repeated experiences*.

  - The brain learns to expect familiar patterns—a process called *priming*. For example, if a parent hugs their toddler every day after work, the child's brain learns to expect that hug once the parent returns home.

  - *Explicit memory* is conscious. It involves facts, events, and experiences we can recall and talk about, such as remembering your first day at school or a family vacation.

KEY QUOTES

"The sooner you repair the connection between yourself and your child, the sooner you can both regain your emotional balance and get back to enjoying your relationship together."

"Your state of mind when you encoded the memory and the state of mind you're in when you recall it influence and change the memory itself. So the story you actually tell is less history and more historical fiction."

"Memories shape our current perceptions by causing us to anticipate what will happen next. Our past absolutely shapes our present and future. And it does so via associations within the brain."

For children to feel emotionally grounded, they need to **integrate implicit and explicit memories**—to understand what happened, how it shaped them, and how to move forward.

- The *hippocampus* (the brain's "search engine") helps to link implicit memory (emotions and sensations) with explicit memory (facts and narratives), so kids can make sense of their experiences and regulate their emotions.
- If left unintegrated, implicit memories are like scattered puzzle pieces that cause confusing emotions and behaviors. Help kids to *piece those parts together* into a clear story.
- There are *2 whole-brain strategies for memory integration*:

  (i) Replay memories to process them; and

  (ii) Practice daily storytelling and recollection.

Replay memories to process them. Help kids to revisit difficult experiences at their own pace. Introduce them to the "mental remote control," where they imagine pausing, rewinding, or fast-forwarding through the memory like a movie.

- This gives them a *sense of control* over what they recall, reducing fear and anxiety to allow healing. For example, a boy named Eli was traumatized after a woodworking accident. His father helped him retell the story bit by bit, using the mental remote to skip the most painful parts until Eli was ready to face them. Over time, Eli regained his confidence and overcame his fear.

Practice daily storytelling and recollection. Make it a family ritual to talk about everyday events, both the good and the bad. This helps to process hard moments and to reinforce positive experiences, family milestones, and important values.

- Ask guiding *questions that encourage recall*, e.g. "What happened when you visited your friend?" or "How did you feel when you talked to your teacher?"
- *Encourage journaling* as a way to express their experiences.
- Use *games, old photos, scrapbooks, or keepsakes* to spark memories and storytelling. For example, play a game where they share 2 truths and 1 lie, then you guess which 2 are true.

KEY QUOTES

"The more you can help bring those noteworthy moments into their explicit memory—such as family experiences, important friendships, or rites of passage—then the clearer and more influential those experiences will be."

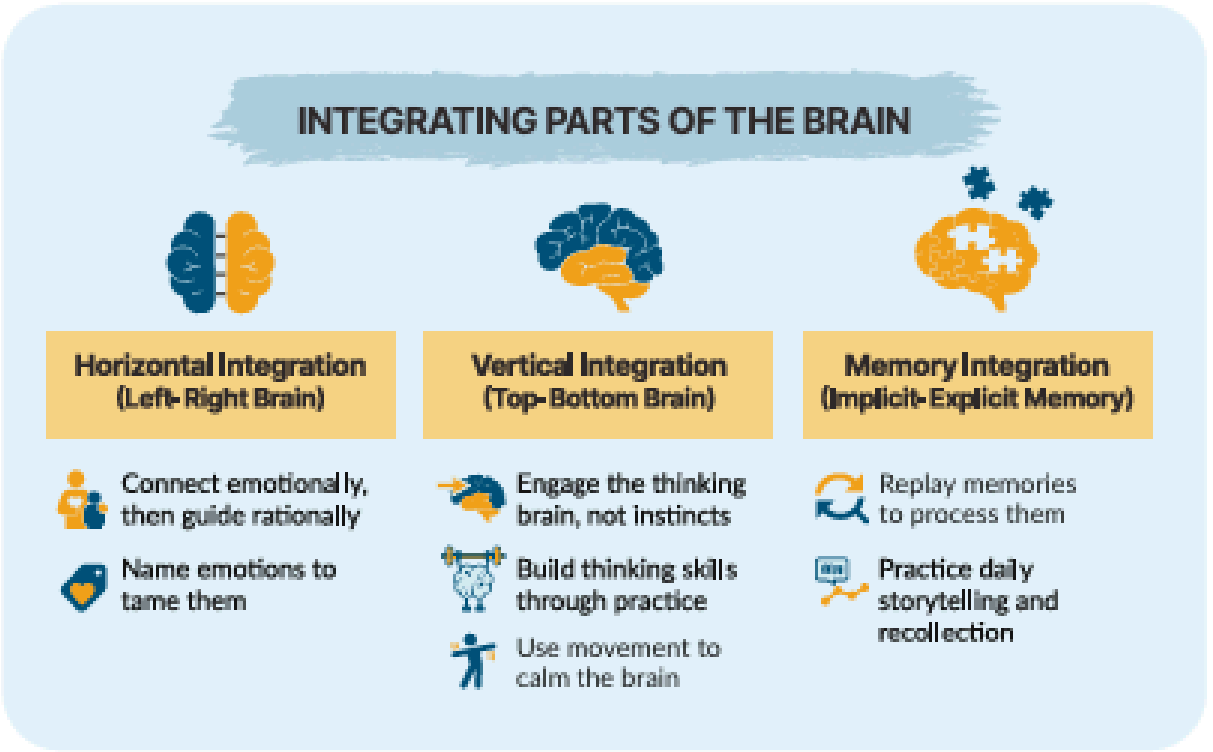
"Just like you might fast-forward through the scary parts of a movie or rewind to watch your favorite scene again, the remote of the mind is a tool that gives your child some control while revisiting an unpleasant memory."

"The more you can help bring those noteworthy moments into their explicit memory… then the clearer and more influential those experiences will be."

Parents are affected by implicit memories too. Unprocessed memories from your past can influence how you react to your child.

- For example, a dad who had buried trauma from a past medical scare found himself panicking every time his baby cried. Only after *processing his own memories* was he able to respond calmly and appropriately.

- If you find yourself *overreacting* to your child's behavior, pause and ask yourself: Why am I reacting this way? Does this remind me of something from my past? Once you recognize your triggers, you can consciously choose your response, rather than being driven by automatic reactions.



Part 2: Developing Mindsight

Mindsight is the ability to perceive/shape our inner world, and choose how we respond to them. It includes intrapersonal and interpersonal skills, and requires all 4 parts of the brain to work together.

Intrapersonal Integration (Self-Understanding)

Help kids to **connect with their inner world** so they can manage emotions, build resilience, and develop a strong sense of self.

- Children often *confuse temporary emotions with identity*. Instead of saying, "I feel sad," they might say, "I am sad." Instead of, "I made a mistake," they think, "I am a failure." This

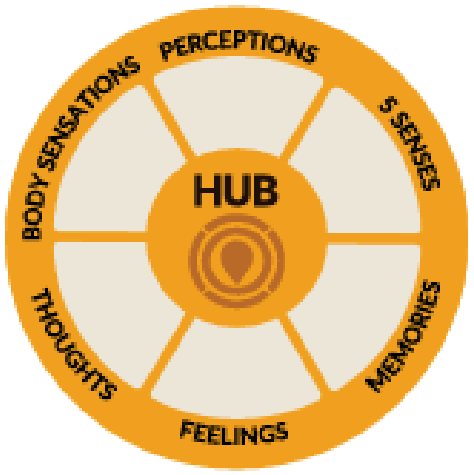
KEY QUOTES

"By integrating your implicit and explicit memories and shining the light of awareness on difficult moments from your past, you can gain insight into how your past is impacting your relationship with your children."

"Feelings need to be recognized for what they are: temporary, changing conditions. They are states, not traits."

can be harmful, because passing emotions may harden into deep-seated beliefs about who they are.

One powerful tool for building self-understanding is Daniel Siegel's **Wheel of Awareness**.



- The *rim* represents things we may focus on (e.g. thoughts, feelings, memories, sensations), while the *hub* represents awareness or the ability to step back and choose what to focus on.

- One *goal of mindsight* is to help children return to the hub, rather than getting stuck on any one point of the rim. For example, 11-year-old Josh excelled in school, sports, and music, but constantly felt he wasn't good enough. A therapist helped Josh trace his perfectionism back to early childhood. His brain had linked making mistakes with being abandoned after his father left. Through the Wheel, Josh realized that self-criticism was just one part of his experience, not his whole identity. He learned to shift focus to other parts—like his talents, friendships, and resilience—building new confidence and the ability to enjoy life.

- There are *3 whole-brain strategies for intrapersonal integration*:

  (i) Let fleeting emotions pass;

  (ii) SIFT the inner landscape; and

  (iii) Return to the hub of awareness.

Let fleeting emotions pass. Emotions (e.g. sadness or anger) last for only about 90 seconds. The initial surge usually fades quickly, unless they're fueled by ongoing thoughts and reactions.

- Teach kids that *emotions are temporary*, like passing clouds. Feeling upset doesn't mean they are broken or bad. Help them to notice their emotions without judgment, and let the feelings rise and fall naturally without denying or clinging to them.

SIFT the inner landscape. SIFT stands for sensations, images, feelings, and thoughts—the 4 key elements that shape our inner world.

KEY QUOTES

"We need to help children understand that the clouds of their emotions can (and will) roll on by. They won't feel sad or angry or hurt or lonely forever."

"[Teach] kids that they have choices about what they focus on and where they place their attention."

"We can shift our focus to other rim points on the wheel of awareness, so that we are no longer victims of forces seemingly beyond our control, but active participants in the process of deciding and affecting how we think and feel."

"By directing our attention, we can go from being influenced by factors within and around us to influencing them."

"Simply recognizing different sensations like hunger, tiredness, excitement, and grumpiness can give children a great deal of understanding and ultimately influence over their feelings."

- *Sensations*: Notice physical body signals (e.g. butterflies in the stomach = anxiety), then use these cues to regulate emotions.

- *Images*: Help kids to notice mental images from memories, dreams, or imagination, as well as the emotions being triggered.

- *Feelings*: Use specific words to label emotions (e.g. disappointed, excited), instead of vague labels (e.g. bad, fine).

- *Thoughts*: Teach them to observe their thoughts and realize that thoughts are not facts. A thought like "I'm so stupid" can be reframed as "I learning from my mistakes."

Return to the hub of awareness. When kids are overwhelmed by strong emotions, they need tools to recenter and calm down. Teach mindsight exercises that help them to return to the hub of awareness, regain balance and control. Examples include:

- *Breathing exercises*: Guide them to lie down, observe their surroundings, and then focus on their breathing.

- *Visualization*: Teach them to imagine peaceful scenes, e.g. floating in a pool or swinging in a hammock. When they're overwhelmed, they can use these mental images to relax and regain control.

Parents can also benefit from mindsight. Stay centered in the hub and choose where to focus your attention, so as to better manage your reactions, stay calm, and parent more intentionally.

- *Example*: Imagine you come home exhausted and see toys scattered all over the floor. You feel irritation rising. But instead of snapping, you pause and remind yourself that feelings are just one point on the rim. You shift your focus to sweeter memories like your child's hugs and laughter. As you redirect your focus, it shifts your emotional state, allowing you to respond in a more thoughtful way.

Interpersonal Integration (Relationship-Building)

Interpersonal integration is about building healthy, meaningful relationships with others, with a balance of individuality and connection. Too much focus on "me" can lead to selfishness and isolation, while too much focus on "we" can lead to dependency and vulnerability to peer pressure.

KEY QUOTES

"When a child becomes aware of the images that are active in his mind, he can use his mindsight to take control of those images and greatly diminish the power they have over him."

"Ideally, we want our kids to recognize that there's a colorful rainbow of rich emotions within them, and to pay attention to these different possibilities."

"Remember that just by talking about the mind, you help develop it."

"To become a part of a well-functioning "we," a person needs also to remain an individual "me.""

- The brain is a social organ that's shaped through interactions with others. Thanks to *mirror neurons* in our brain, we can understand and mimic others' emotions and actions. We even get infected by others' moods and feelings. That's why yawns are contagious, or why we smile when we see others laugh.

- Through early interactions, children develop *essential social skills* like listening, reading facial expressions, and sharing. These shape how they approach future friendships, romantic relationships, and even parenting.

  - If caregivers are responsive and nurturing, children learn that relationships are safe, supportive, and comforting. If caregivers are unreliable, distant, or harsh, children may learn to suppress their needs or fear closeness.

- Strong relationships are built on a *receptive (open) mindset* instead of a reactive (defensive) one:

  - When the brain perceives a threat, it shifts into a defensive fight, flight, or freeze mode, making it harder to listen, trust, or connect.

  - When the brain feels safe, it relaxes and opens up to others, allowing real connection.

- There are *2 whole-brain strategies for interpersonal integration*:

  (i) Build bonds through family fun; and

  (ii) Turn conflict into connection.

Build bonds through family fun. Positive interactions—whether through games, jokes, or shared activities—strengthen family bonds and teach kids that relationships are a source of happiness and comfort.

- Fun, joyous moments trigger the release of *dopamine*, a chemical that reinforces positive feelings, thereby strengthening the desire for meaningful relationships.

- Simple ways to *bring fun into family life* include: games, jokes, surprises, or simple traditions like a Friday movie night or Sunday pancake breakfast.

- Playfulness can also *defuse frustration*. A well-timed joke or silly gesture can turn tension into laughter.

KEY QUOTES

"Interpersonal integration means that we honor and nurture our different while cultivating our connections with one another."

"Kids who have difficulty relating to others need to have those connections encouraged and cultivated."

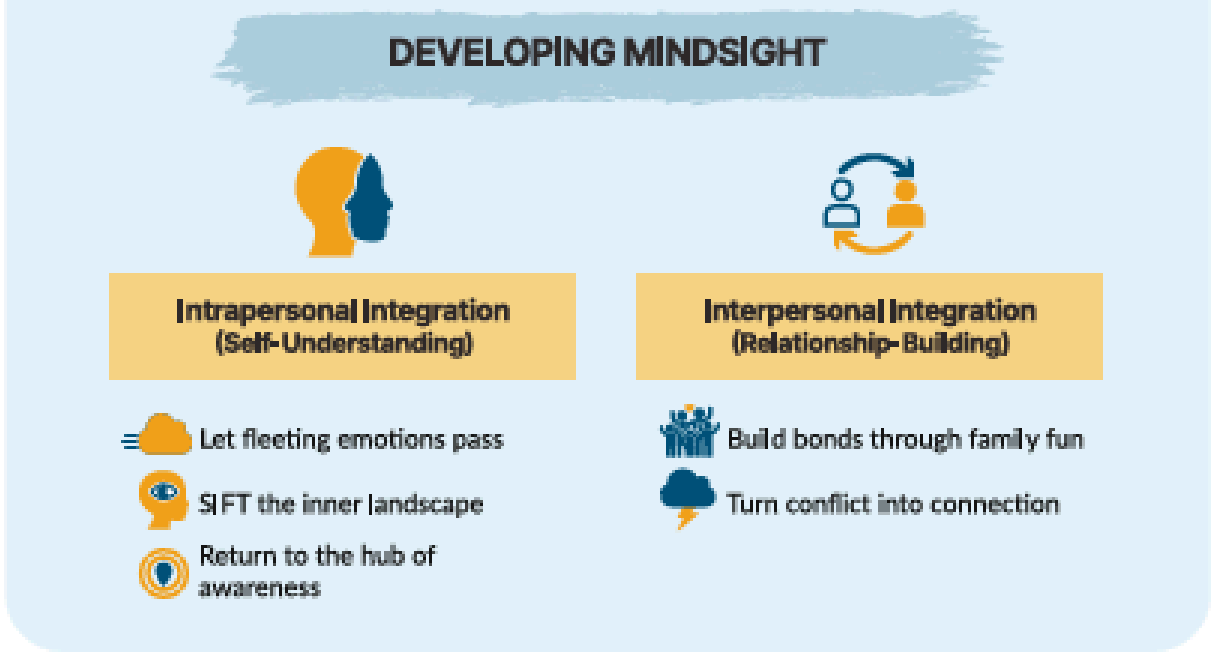
"Your state of mind can influence your child's state of mind, letting you transform fussiness and irritability into fun, laughter, and connection."

"Receptivity can lead to resonance—a way of joining from the inside out—that will allow them to enjoy the depth and intimacy that come with meaningful relationships."

"With every fun, enjoyable experience you give your children while they are with the family, you provide them with positive reinforcement about what it means to be in loving relationship with others."

Turn conflict into connection. Conflicts, when handled well, can become opportunities to deepen relationships.

- Use conflicts to *teach perspective-taking*. Start by validating the child's emotions, even if you disagree with their behavior. Then, guide them to consider the other person's view, e.g. "Do you think he was upset about something?"
- Teach them to *read nonverbal cues*, like facial expressions, posture, and tone. For example, "Your friend says he's fine, but his shoulders are slumped. How do you think he really feels?"
- Help them express themselves, listen actively, work together to find solutions, and *repair relationship ruptures*. For example, if a child breaks a sibling's toy, they could fix it, replace it, or do something kind to make amends. Ask, "If your favorite toy were broken, what would help you feel better?"



Conclusion and Other Details in the Book

Parenting is a huge responsibility, since every interaction you have with your child shapes their emotional and cognitive development. By **applying whole-brain strategies**, you can nurture children who are resilient, self-aware, and capable of strong, healthy relationships.

- Remember: *parents with integrated brains* can better role-model emotional regulation, empathy, and resilience, helping children to learn, grow, and thrive.

KEY QUOTES

"By asking questions about how another person feels, about why someone reacted as he did, we can encourage empathy in our children."

"Even children who don't seem predisposed to connection and compassion can learn what it means to be in relationship, and to fulfill the responsibilities that come with it."

"When you've become the active author of your life story and not merely the passive scribe of history as it unfolds, you can create a life that you love."

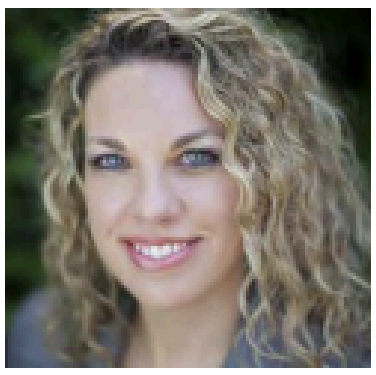
- *Explain to kids how their brains work*. When children understand what's happening inside them, it empowers them to manage their reactions and develop lifelong resilience.

The book includes additional examples, real-life stories, and practical tips to help you apply these strategies across all stages of childhood—from infancy to adolescence. For **more details and resources**, visit https://drdansiegel.com/.

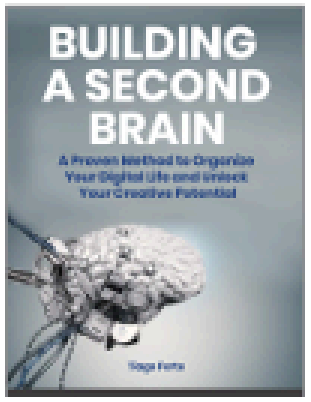
About the Authors

Daniel J. Siegel, M.D. (born 1957) is an acclaimed author, award-winning educator, executive director of the Mindsight Institute, and a clinical professor of psychiatry at the UCLA School of Medicine. He received his medical degree from Harvard Medical School and completed his postgraduate medical education at UCLA. He's the author of several bestselling books, e.g., Mindsight, Brainstorm, and The Developing Mind.

Tina Payne Bryson is a psychotherapist, author, and speaker. She's the Founder/ Executive Director of The Center for Connection, and of The Play Strong Institute, and the co-author of several books. She graduated from Baylor University and earned her Ph.D. from the University of Southern California.



KEY QUOTES



BUILDING A SECOND BRAIN

A Proven Method to Organize Your Digital Life and Unlock Your Creative Potential

TIAGO FORTE

The Big "So What"

All of us have moments when we struggle to absorb new information or recall something important. This step-by-step guide explains how to build a Second Brain—a digital information management system—to remember, retrieve and fully utilize all sorts of information. This improves your productivity, your creativity, and your ability to achieve any goal.

The Second Brain: What it is and why we need it

We live in an information age where we're surrounded by useful data. Yet, we don't retain much of what we read or consume, and struggle to remember important facts and information. Tiago Forte created the Second Brain system to help him capture and manage information in various aspects of his life. This book is the culmination of what he learned after 10 years of research, experimentation, and teaching others to build their knowledge management systems.

- A Second Brain is like an *external brain* where you can store and manage useful information. It's similar to an external hard drive for a computer, or a digital pocket library that contains all the information you want to remember.

- Forte's system leverages *technology* to digitize note-taking and organize information (including images, links, and all sorts of files). The content can be backed up online, searched and synced across multiple devices, to create a "knowledge vault" or a central source of information. It gives you the assurance that all your ideas are safely preserved.

KEY QUOTES

"A Second Brain enables you to recall everything you might want to remember so you can achieve anything you desire."

"So many of us share the feeling that we are surrounded by knowledge, yet starving for wisdom."

"Technology doesn't just make notetaking more efficient. It transforms the very nature of notes."

- Your Second Brain will probably be made up of a set of tools/apps—such as a note-taking app, calendar, email, to-do list, etc—to store/retrieve critical information. This *frees up your mental capacity*, so you can be more creative, productive, and focus your energy on achieving your goals in life.

Capabilities and Benefits of a Second Brain

A Second Brain has 4 key capabilities you can rely on:

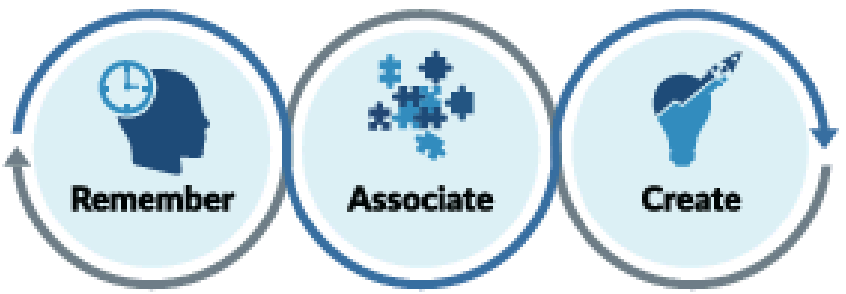
- It *makes ideas tangible* by giving them a visual, external form, making it easier to observe, rearrange, edit, or combine the ideas.

- It *unveils connections between ideas*. When diverse ideas are placed together, we're more likely to notice unusual patterns. We can also shuffle and combine the ideas creatively, like forming words in a game of Scrabble.

- It *nurtures ideas over time*. We tend to focus on ideas that are recent or accessible, regardless of their actual value. With a Second Brain, we can gather and incubate ideas to develop better insights and solutions over time.

- Often, we get stuck not because we lack skills/talent, but because we lack sufficient material to spark our imagination or convince others. The Second Brain provides a wealth of resources (e.g. stories, examples, images, statistics, quotes, analogies) to let you *present your views and ideas convincingly*.

Knowledge is the most valuable asset for modern professionals. A Second Brain helps you to manage personal knowledge in 3 stages.



- It serves as a memory aid to help you *remember* things (e.g. facts, important dates, project details), and retrieve them easily in the future.

KEY QUOTES

"Only when we declutter our brain of complex ideas can we think clearly and start to work with those ideas effectively."

"In its most practical form, creativity is about connecting ideas together, especially ideas that don't seem to be connected."

"If it feels like the well of inspiration has run dry, it's because you need a deeper well."

"Our intuitive mind learns, and responds, even without our conscious awareness."

- It serves as a thinking tool to help you *associate* ideas and see things from fresh perspectives.
- It serves as an innovation tool to help you combine different ideas and *create* something new and unique.

The CODE Method to Remember What Matters

The CODE System involves 4 steps—Capture, Organize, Distill, Express—to help you develop a Second Brain systematically.

1. Capture what Resonates

Save noteworthy information that resonates with you, and store them in a location you can control.

For centuries, intellectuals, artists and successful people have kept notebooks, sketchbooks, or journals where they recorded their thoughts and reflections. These served as personal knowledge banks where they could return to build on their content and ideas.

- For *example*, famous music artist, Taylor Swift, uses her phone to capture and edit lyrics, melodies and new song ideas on the go. Other songwriters often compile "hook books" of song lyrics and music, software engineers build "code libraries", and lawyers keep "case files".
- Recording knowledge in a concrete form yields several *benefits*:

  (i) It's *easier to remember information* written in your own words;

KEY QUOTES

"Creative people are better at recognizing relationships, making associations and connections."
—Nancy C. Andreasen

"Information isn't a luxury—it is the very basis of our survival."

"Notetaking is the easiest and simplest way of externalizing our thinking. It requires no special skill, is private by default, and can be performed anytime and anywhere."

(ii) It's *easier to review ideas* objectively from a distance (instead of reacting impulsively to them); and

(iii) It allows you to examine, connect and experiment with the ideas to *realize their full potential*.

A knowledge bank should contain both external and internal knowledge. These include:

- *External content*, e.g. highlights from your readings, digital bookmarks, meeting notes, or voice memos; and
- *Internal content*, e.g. insights, reflections, memories, random thoughts, or personal experiences.
- However, *exclude* sensitive information (e.g. passwords, tax records), or large/special format files (e.g. photoshop files).

To decide what to capture, consider if the content is (i) inspiring, (ii) useful, (iii) personal, and (iv) surprising enough to spark new ideas.

- Don't overanalyze it. *Follow your intuition* to decide if an idea is noteworthy and resonates with you. Identify the topics or problems that intrigue you the most, and let them guide you on what information to capture.

  (i) Examine the things that fascinated you since young, and phrase them as open-ended questions.

  (ii) Then, carry the list with you to fuel your curiosity, connect seemingly-unrelated ideas, and find novel solutions.

- Save only the *most valuable parts* of the content, and capture them succinctly using bullet points, quotes, or short sentences.
- *Other useful information* to capture include: links to the original sources, chapter titles, headings, publication dates, and even contradictory ideas that challenge your beliefs.

Here are some additional tips for capturing information:

- There are many *tools* you can use to record digital content easily. You can find a list of recommended tools on the author's website. Some examples include:

KEY QUOTES

"Thinking doesn't just produce writing; writing also enriches thinking."

"The more economical you can be with the material you capture in the first place, the less time and effort your future self will have to spend organizing, distilling, and expressing it."

(i) Read-later apps to bookmark online content for review later;

(ii) Web-clipper apps to capture parts of web pages;

(iii) Audio/voice transcription apps and ebook apps for exporting transcripted text, notations or highlights;

(iv) Notes apps for saving text snippets; and

(v) Social media apps for "favoriting" and exporting content.

- The key is to *consolidate your notes in 1 place*. Ideally, choose a note-taking app that:

(i) Can store multimedia content (images, sketches, audios);

(ii) Is easy to use (no need for complex steps or formatting);

(iii) Is open-ended (so you can add content anytime);

(iv) Is action-oriented (i.e. you can jot down random thoughts).

There are many great apps like Microsoft OneNote, Google Keep, Apple Notes, Notion and Evernote. To keep things simple, start with an app you already have and upgrade it along the way.

2. Organize for Action

As you accumulate more notes, you'll need to organize them. Categorize the materials according to the active projects that you're working on, or how they'll help to achieve your goals.

Organize the information by purpose or action, not generic categories. This gives you greater clarity and motivation to move toward your goals.

- For *example*, famous dance choreographer Twyla Tharp uses labelled boxes as her Second Brain.

(i) Each time she starts a new choreography project, she writes its name clearly on a box, and specifies the goal upfront (e.g. "perfection" or "keep it simple") to keep herself on-track.

(ii) Whenever she comes across useful materials (e.g. pictures, videos, costume inspiration, personal ideas), she

KEY QUOTES

"Think of your capture tools as your extended nervous system, reaching out into the world to allow you to sense your surroundings."

"Organizing for action gives you a sense of tremendous clarity, because you know that everything you're keeping actually has a purpose."

deposits them in the relevant box. Thereafter, she can revisit the boxes anytime to work on a project or learn from past projects.

Forte created the PARA Organizing System to reflect 4 key types of information around us: Projects, Areas, Resources, and Archives. Use this system to file your information where it's the most useful or actionable.

- *Projects* are the short-term items that you're actively working on right now. These could be items that are on your to-do list, or just something on your mind to follow up on.

  (i) Such projects could be work-related (e.g. creating a presentation slide deck), personal (e.g. planning your vacation), or side projects (e.g. researching a new sofa).

  (ii) Each project comes with (a) a specific timeline and (b) concrete targets or outputs.

- *Areas* are personal or professional responsibilities to be managed over the long-term, e.g. health, finance, recruitment.

  (i) These are not project-specific. They don't have specific goals or timeframes, and aren't immediately actionable.

  (ii) However, they may include smaller projects, e.g. under the area "health", you may be working on a project to "lose 5 kg".

- *References* are topics or information that don't belong to a project/area, and aren't immediately actionable, but could be useful in the future. Examples include: hobbies/interests (e.g. poetry, movies, or home decor), research topics (e.g. nutrition or note-taking), and useful references (e.g. holiday gift ideas, stock photos).

- *Archives* are inactive items from the other 3 categories that you no longer use, e.g. finished projects or hobbies you've lost interest in. Move them to this container to organize your workspace without losing any information.

The PARA classification is universal, i.e. you can use it for *any* information. It's also arranged in order of actionability, with Projects being the most concrete and actionable.

- You can replicate this organizing system across *multiple softwares, apps, or platforms*. For example, you may use PARA

KEY QUOTES

"We don't need complex, sophisticated systems to be able to produce complex, sophisticated works."

"PARA isn't a filing system; it's a production system...The whole system is constantly shifting and changing in sync with your constantly changing life."

to label your 4 main folders or categories, and create unlimited number of sub-folders or sub-categories under each one.

(i) When you finish a project, move it to your archives to clear your workspace (and consequently your mental space).

(ii) Each time you start a new project, go through your archives to look for relevant materials from past projects.

- Your notes should *evolve* as your goals change. For example, you may initially file a note about coaching under "Resources" when you attend a course, but later move it to "Projects" when you're creating your own coaching program.

- The key is to create containers that are *easy to understand, use, and maintain*. Make sure that you can move the contents without losing them.

KEY QUOTES

"PARA is a dynamic, constantly changing system, not a static one."

3. Distill the Essence

Our initial notes are like raw materials that must be processed and refined before they can become valuable assets. Filter your notes down to their essence, so you can find, use and share the ideas easily in the future.

Most ideas and information we acquire can't be used until much later. By the time we need those ideas, we've usually forgotten them, or can no longer find the idea amongst tons of notes. To keep ideas discoverable, we need to distill the core ideas into just 1-2 sentences, or a form that our future selves can find/grasp quickly. It's like how Einstein summarized his insights about energy into the well-known equation $E=MC^2$.

You can use Forte's Progressive Summarization Technique to extract the most important points from your notes.

- Basically, you *highlight your notes in layers* using different formats (e.g. bold, underline):

  (i) Highlight *chunks of text* in your raw notes, to help you revisit your notes in detail, or to find a specific point. Add a link to the original source for future reference.

"Notetaking is like time travel—you are sending packets of knowledge through time to your future self."

(ii) Then, bold the *key words or phrases* that indicate what the note is about, what's the author's key message, or what resonates with you.

(iii) If the note is very long or important, add a 3rd layer by underlining *valuable points*.

(iv) If the note is truly valuable, add an *executive summary* in bullet points, using your own words. Put this at the top of your note so you can revisit it quickly.

- This approach allows you to retain the original details while making the key points more prominent. You can *zoom in or zoom out* depending on the amount of time and details you need, and there's no risk of losing important information as you distill the key points.

Each time you add highlights, headings, bullets, and comments to your notes, you're making your notes more discoverable and useful for your future self.

- Here are *3 rules of thumb* for highlighting:

(i) Don't overthink the process. *Just go with your intuition* on what's important.

(ii) Highlight no more than *10-20%* of the previous layer.

(iii) Don't start highlighting until you're clear on the *purpose* or what you'll use the notes for.

- In the book, Forte shows how this method can be used in a wide range of applications, from online articles to podcasts/ audios and meeting notes. Many *top creative minds* use distillation to enhance their art forms. For example:

(i) Renowned film director Francis Coppola has the habit of making notes as he reads a long storyline. He jots down his impressions and annotates the parts that resonate with him, before distilling and reconstructing them into unique ideas for directing blockbuster films.

(ii) In the painting *Picasso's Bull*, Pablo Picasso literally showed what it meant to deconstruct something down to its most essential form. He used a series of 11 images

KEY QUOTES

"Speed is everything when it comes to recall...the faster you can move through your notes, the more diverse and interesting ideas you can connect together."

"In making decisions about what to keep, we inevitably have to make decisions about what to throw away."

"As you distill your ideas, they naturally improve, because when you drop the merely good parts, the great parts can shine more brightly."

to portray a bull, including a version with layers of paint and a version where the bull was captured in just 1 simple, continuous line.

4. Express your Ideas

Show your work and test your ideas frequently to get feedback. Create a system to store and build on your intermediate work.

Information only becomes true knowledge when you apply it. Don't wait for complete or perfect information. Regularly test your ideas in small chunks, e.g. to critique or teach an idea, lobby for a cause, or create a solution.

- This allows you to *gather feedback*, and iteratively test/refine your ideas until you achieve your goals. The process also allows you to draw inspiration from external sources and combine them with your own ideas/experiences to create something new.

- For *example*, award-winning science-fiction writer Octavia Estelle Butler sought inspiration from her daily life, travels and readings. She always carried a notebook with her and recorded the smallest details, from her grocery lists to ideas for her stories. She distilled, modified, and added to those notes until they became masterpieces of science-fiction.

Your work-in-progress—including your notes, outlines, drafts, and feedback—contains valuable insights that could be reused in future. Use your Second Brain to capture these "Intermediate Packets" or IPs so they won't go to waste.

- Your IPs are the *building blocks* that make up your work. For example, a salesperson's work can be broken down into making calls, sending pitches, meeting clients, and closing deals.

- IPs can come in the form of online bookmarks, diary entries, social media content, old conference notes, etc. You can create and recycle at least *5 types of IPs*:

  (i) Notes that you've distilled from Step 3;

  (ii) Ideas discarded from past projects;

KEY QUOTES

"Information becomes knowledge—personal, embodied, verified—only when we put it to use."

"If there is a secret to creativity, it is that it emerges from everyday efforts to gather and organize our influences."

"Use what you have; even if it seems meager, it may be magic in your hands."
—Octavia Butler

"[IPs reframe] creativity as an ongoing, continual cycle of delivering value in small bits, rather than a massive allconsuming endeavor that weighs on you for months."

(iii) Work-in-progress (e.g. graphics, plans) from past projects;

(iv) Completed work that you can use as a building block; and

(v) Documents or knowledge assets from others. You should give credit or acknowledge those sources in your final work.

- When you break down complex work into smaller IPs, it brings *several benefits*. You can:

  (i) Focus your attention on 1 manageable chunk at a time;

  (ii) Make use of small pockets of time to finish chunks of work;

  (iii) Get more frequent feedback to improve your progress; and

  (iv) Connect your IPs in creative ways, like LEGO blocks.

- There are 4 ways to *find or retrieve relevant IPs*:

  (i) Use the search feature in your notes app;

  (ii) Browse your folders manually;

  (iii) Create tags for your notes/materials (then search by tags); and

  (iv) Rely on serendipity or calculated chances to find what you need. Scan at a broad level by looking across a range of projects, areas and resources, and selectively reviewing your notes. Look at saved images to tap into the visual parts of your brain, and share your ideas to get feedback and fresh perspectives.

Improving your Creative Process with CODE

Creativity doesn't happen randomly. The best creative minds strategize and develop habits that allow them to continually collect, process and combine raw materials to find new inspiration. By the time they sit down to create something, they already have the ingredients in place. The 4-step CODE Method is designed to standardize how you work, so you can concurrently maximize your creativity *and* productivity.

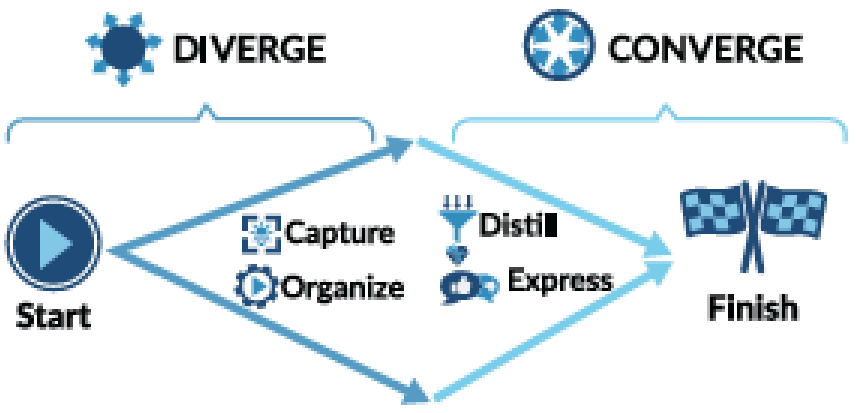
KEY QUOTES

"Like LEGO blocks, the more pieces you have, the easier it is to build something interesting."

"Innovation and problem-solving depend on a routine that systematically brings interesting ideas to the surface of our awareness."

The Divergence-Convergence Loop

Every creative process involves alternating between divergence and convergence in an ongoing loop.



- *Divergence* is about expanding your possibilities by gathering a wide range of ideas/options and discussing them openly. This relates to the first 2 steps of the CODE method: to Capture and Organize ideas, so you can continually build on them.

- *Convergence* is about narrowing down your options to keep only what is essential/valuable, and use it to move toward your end-goal. This relates to the last 2 steps of the CODE method: to Distill and Express your ideas to create something new.

- *For example*, a writer diverges by researching facts/materials and developing potential characters. Then, she converges by drafting an outline, plot points and a first draft, before diverging again to add on new ideas or details.

You can use these 3 strategies to get started:

- Use the divergent mode to collect groups of ideas, then use the convergent mode to *connect the clusters of ideas* and organize them into a logical sequence. Do this digitally, as it's easier to edit, add links, add multimedia or interactive features, search for specific terms, and access the content from synced devices.

- Don't stop work only when you're totally exhausted. Reserve some energy to *power up the next day's work*. At the end of a work session, set aside some time to write down (i) where you're at, (ii) details to remember, (iii) ideas for your next steps, and (iv) what you intend to do next.

KEY QUOTES

"Instead of starting with scarcity, start with abundance—the abundance of interesting insights you've collected in your Second Brain."

This allows your mind to continue working on the task subconsciously, so you'll resume your work knowing exactly what to do. Ideally, share each day's IP for additional feedback.

- We tend to procrastinate when we're faced with an overlycomplex project. *Reduce the scope of your task* by parking the less important parts in your Second Brain. Focus on a small, manageable chunk, and retrieve the extra details later if required. For example, if you want to create a 4-week course, start by creating a free trial lesson.

Build 3 Habits To Keep Your Second Brain Organized

Use project checklists to start and end each project well, and to progressively build up the IPs/building blocks for future projects. Over time, the steps on the checklists should become second nature to you.

- Your *project kickoff checklist* could include:
  - (i) Recording your initial thoughts in a new project folder;
  - (ii) Searching/reviewing old folders to extract useful material;
  - (iii) Transferring useful notes to the current project folder;
  - (iv) Outlining the project;
  - (v) Defining your success criteria;
  - (vi) Doing a pre-mortem to consider what you wish to learn and the potential risks/challenges you may face; and
  - (vii) Communicating with your stakeholders to launch the project.
- At the end of a project, decide what information can be reused in the future and what to archive. Your *project completion checklist* could include:
  - (i) Checking off the project in your apps/lists, and marking the associated goals as "completed";
  - (ii) Reviewing the project IPs and moving them to relevant PARA folders;

KEY QUOTES

"There are habits that can help us be more organized so that our creativity has space to arise."

"Being organized is a habit—a repeated set of actions you take as you encounter, work with, and put information to use."

"Building a Second Brain…is about adopting a dynamic, flexible system and set of habits to continually access what we need without throwing our environment (and mind) into chaos."

(iii) Syncing the contents across all platforms;

(iv) Updating an inactive project's status before archiving it;

(v) Evaluating how far you met your success criteria;

(vi) Doing a post-mortem to consider what you learnt, what you did well, and how you could improve in future; and

(vii) Communicating with your stakeholders to close the project.

Do weekly and monthly reviews of your personal and professional life to decide what to keep/change. As you do your reviews, go through the notes you created that week/month, add titles, and sort them into the PARA folders.

- Use *weekly reviews* to reset your digital workspaces so you won't get overwhelmed. You can clear your inboxes and computer desktop, check your calendar, and set your tasks/priorities for the week.

- Use *monthly reviews* for a more holistic evaluation of your ambitions, priorities and working systems. You can update your goals and project lists, review your areas of responsibilities and "someday/maybe list" to consider if there're tasks or actions that should be reprioritized.

Make mental housekeeping a part of your daily routine. Use every opportunity to notice and capture potentially useful information, then highlight, edit, and organize your notes to make them more discoverable for your future self.

- Don't accumulate mental clutter, then try to set aside time just to clear them. Instead, use your spare time or gaps in your schedule to do *organize your Second Brain daily*.

Conclusion and Other Details in the Book

The Second Brain isn't just about finding/using the best tools. It's about freeing your brain to do what it's designed to do—to connect, innovate, learn, grow, and orchestrate your life. The more you use your Second Brain, the more it changes the way you think and see the world. You'll find yourself feeling calmer and more focused, developing greater self-awareness, and experiencing a fundamental

KEY QUOTES

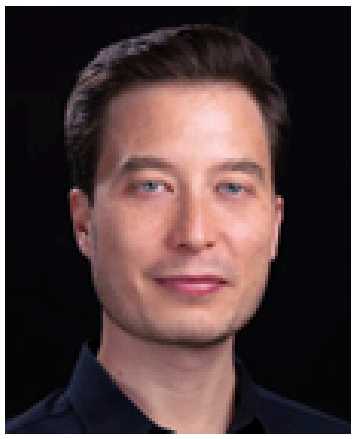
"It's crucial to stay organized, but it needs to be done a little at a time in the flow of our normal lives."

"The purpose of knowledge is to be shared. Knowledge is the only resource that gets better and more valuable the more it multiplies".

mindset shift (i) from scarcity to abundance, (ii) from consumption to creation, and (iii) from stress/obligation to serving and sharing with others,

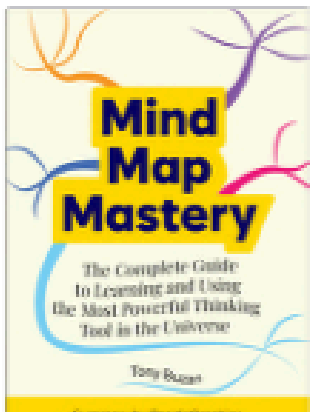
The book is packed with examples and tips to help you to understand and apply the CODE Method to create and maintain your Second Brain. You can find more resources (such as the recommended tools/apps and tips for tagging) from https://www.buildingasecondbrain.com or https://fortelabs.com.

About the Author



Tiago Forte is an author, entrepreneur, and consultant, best known for his research and teachings on productivity. He's the founder of productivity consultancy and training firm Forte Labs (fortelabs.co). He has worked with many global organizations, and taught thousands of people to improve their personal effectiveness, productivity, and creativity.

KEY QUOTES



MIND MAP MASTERY

The Complete Guide to Learning and Using the Most Powerful Thinking Tool in the Universe

Tony Buzan

The Big "So What"

This book is a comprehensive guide on how to use Mind Maps to tap into your brain's multiple intelligences and realize your true potential.

Introduction

Mind Mapping is a technique that visualizes concepts, ideas, and information radiating from a central theme. It promotes intuitive and associative thinking, making it a powerful tool for creative thinking, concentration, information processing, and memory improvement. It can even help to counter Attention Deficit Hyperactivity Disorder (ADHD) and combat dementia.

A Brief History of Mind Maps

Since ancient times, humans have used images to express themselves and to organize information visually and hierarchically.

- For example, *ancient civilizations* categorized knowledge and philosophical concepts using tree structures. During the *Medieval and Renaissance periods*, scholars and thinkers used diagrams and memory systems to visualize and organize knowledge.

- In the *20th century*, Tony Buzan formalized and popularized Mind Mapping. Drawing from psychology, neurophysiology, and creative thinking, he established specific elements and principles that enhanced the effectiveness of Mind Maps for learning and thinking.

KEY QUOTES

"Your brain is a sleeping giant, and Mind Map Mastery is here to help wake it up!"

"A Mind Map is a revolutionary thinking tool that, when mastered, will transform your life. It will help you process information, come up with new ideas, strengthen your memory, get the most out of your leisure time and improve the way you work."

Since the 1960s, Mind Mapping has evolved from a manual, paper-based technique to a versatile digital tool utilized in various fields, from education to business, project management, and personal development. It has been adopted by hundreds of millions of people worldwide.

- Unfortunately, Mind Mapping is often *misunderstood and misapplied*, which prompted Buzan to write this book. He wanted to clarify the fundamentals of Mind Mapping, and protect the integrity of this tool so more people can continue to benefit from it.

- In this summary, we'll present the key ideas in *2 parts*:

  (i) Mind Mapping Fundamentals; and

  (ii) Applying Mind Maps effectively in your life.

Part 1: Mind Mapping Fundamentals

How/Why Mind Maps Work

The Mind Map is built on Radiant Thinking principles which mirror how the brain works.

- Human thinking is *non-linear, associative, and multi-dimensional*. When you think of the word "orange", you visualize the fruit, its color, taste, and scent, rather than its spelling. Each idea naturally leads to many others, allowing our brain to make infinite connections.

- The Mind Map mimics this *organic and multi-dimensional* thought process.

  (i) A Mind Map centers on a core idea, with primary branches representing related themes or categories.

  (ii) These branches radiate outwards and sub-divide into smaller branches, just like how thoughts and ideas branch out and interconnect in the human brain.

KEY QUOTES

"Through the use of associated logic, Mind Maps delve right to the heart of the matter. They also allow you to see the bigger picture."

"The human brain does not think in toolbars, menus and lists; it thinks organically."

"Human Language can be externalized. And when it is externalized in its purest form, it creates a Mind Map."

Since the 1960s, Mind Mapping has evolved from a manual, paper-based technique to a versatile digital tool utilized in various fields, from education to business, project management, and personal development. It has been adopted by hundreds of millions of people worldwide.

- Unfortunately, Mind Mapping is often *misunderstood and misapplied*, which prompted Buzan to write this book. He wanted to clarify the fundamentals of Mind Mapping, and protect the integrity of this tool so more people can continue to benefit from it.

- In this summary, we'll present the key ideas in *2 parts*:

  (i) Mind Mapping Fundamentals; and

  (ii) Applying Mind Maps effectively in your life.

Part 1: Mind Mapping Fundamentals

How/Why Mind Maps Work

The Mind Map is built on Radiant Thinking principles which mirror how the brain works.

- Human thinking is *non-linear, associative, and multi-dimensional*. When you think of the word "orange", you visualize the fruit, its color, taste, and scent, rather than its spelling. Each idea naturally leads to many others, allowing our brain to make infinite connections.

- The Mind Map mimics this *organic and multi-dimensional* thought process.

  (i) A Mind Map centers on a core idea, with primary branches representing related themes or categories.

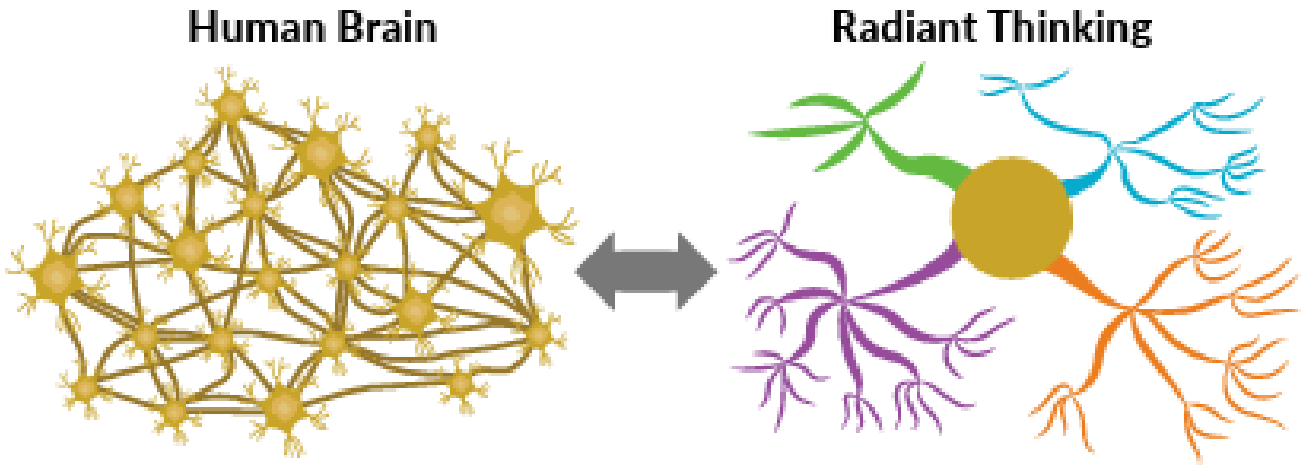
  (ii) These branches radiate outwards and sub-divide into smaller branches, just like how thoughts and ideas branch out and interconnect in the human brain.

KEY QUOTES

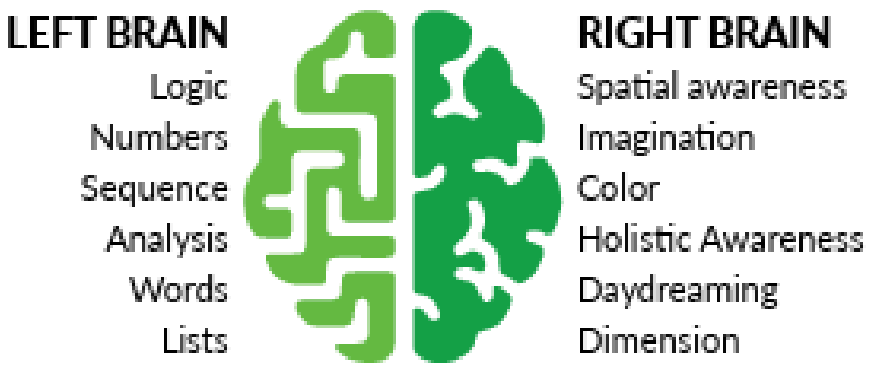
"Through the use of associated logic, Mind Maps delve right to the heart of the matter. They also allow you to see the bigger picture."

"The human brain does not think in toolbars, menus and lists; it thinks organically."

"Human Language can be externalized. And when it is externalized in its purest form, it creates a Mind Map."



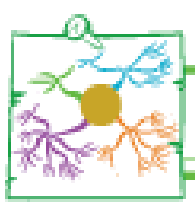
Mind Mapping harnesses whole-brain thinking. It engages both (i) the logical, analytical left brain and (ii) the creative, visual right brain, to boost creativity, memory, and learning.



It uses several ingredients to tap into our brain's natural processes:

- *Keywords and images* (rather than lengthy sentences) to make information easier to remember and recall;
- *Colors and visuals* to enhance memory and distinguish between categories/layers of information;
- *Associations* across diverse ideas to spark creativity.

Mind Maps are deeply personal. Your Map's structure, color choices, and connections mirror your unique thought patterns and understanding of the subject.



How To Create a Mind Map

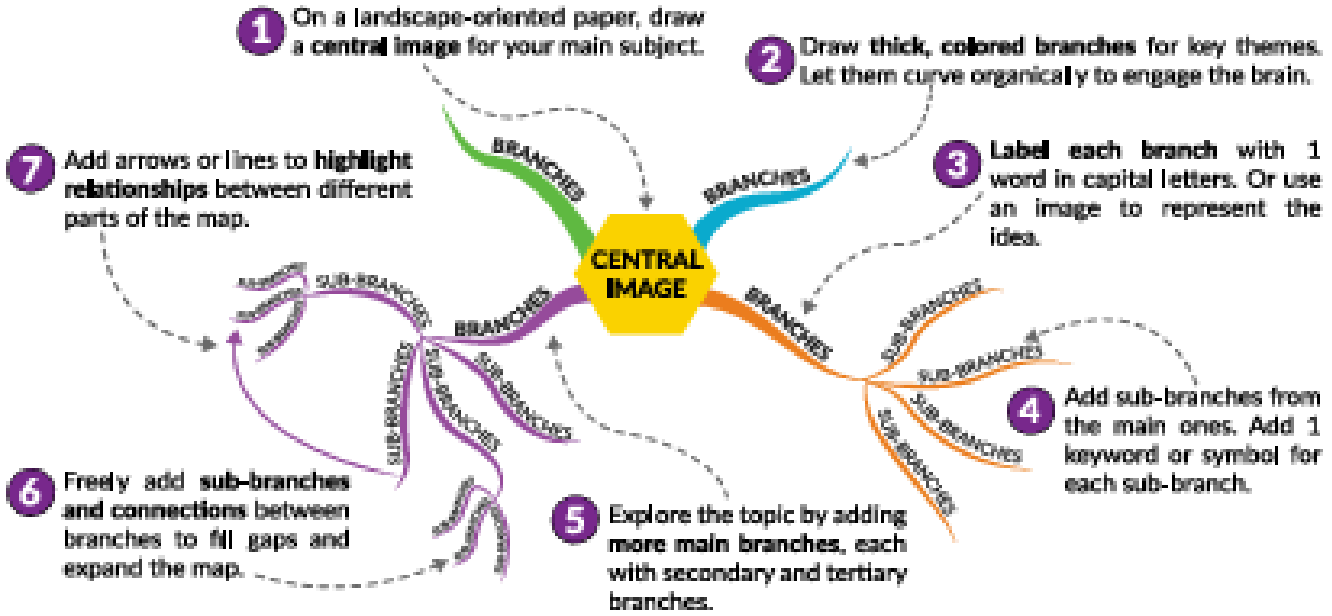
Follow these 7 steps to draw an effective Mind Map.

- On a landscape-oriented paper, draw a *central image* that represents your main subject, using at least 3 colors.

KEY QUOTES

"Through the use of colour and images, a Mind Map engages the brain and imprints itself on the memory."

- From the central image, draw *thick, colored branches* to represent the main themes. These branches should curve organically to engage the brain more effectively.
- *Label each branch* with a single CAPITALIZED word or an image.
- Add *secondary and tertiary branches*, with accompanying keywords or symbols.
- Explore the subject by *adding main branches* around the central image, each with its secondary and tertiary branches.
- Let your thoughts flow. As ideas emerge, add *new sub-branches and connections*, to fill the gaps and expand the Mind Map.
- Link different sections of the Mind Map with arrows or lines to show *connections or relationships*.



You can enhance your initial map by adding details, facts, or themes, to deepen understanding and recall.

The Laws of Mind Mapping

Apply these Laws for a structured, effective approach to Mind Mapping.

- Begin with a *blank, landscape sheet* of paper with ample space for branching out.
- In the center, place a *colorful central image* that represents your main subject. Use at least 3 colors. The image can be

KEY QUOTES

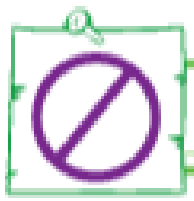
"One word per branch of your Mind Map will make your brain really engage with the subject and go to the heart of the matter. It will give your brain a hook on which to hang a memory."

"Mind Mapping will broaden the horizons of your thinking and will offer you the means to boost your mental accuracy, insight, creativity and freedom of thought."

"'Negative' space in artistic creations helps to define the boundaries of the object and adds balance to a composition."

simple; just make sure it's colorful, vibrant, and illustrates your topic.

- Use *visuals*—images, symbols, codes, and dimensionality—throughout your map to make it more vivid.
- *CAPITALIZE keywords* for emphasis.
- Give each keyword or image its *own branch* for clarity.
- *Branches should flow out from the center*. They should be thicker at the base and taper off as they branch out.
- Match the *length of the branches* to the size of the words/images they carry.
- Develop a *color code* for themes, and use it to differentiate and highlight different areas.
- Use lines or arrows to *link associated ideas*.
- *Use spacing strategically*. Leave some space between branches for clarity, and leave room for additional topics or ideas.



What a Mind Map Is Not

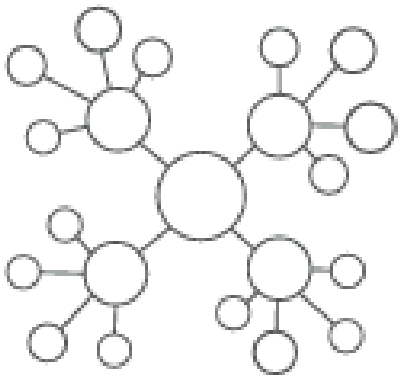
Mind Maps are often confused with other diagrams used by historical figures like Porphyry, Leonardo da Vinci, and Sir Isaac Newton. These alternatives lacked the specific characteristics of Mind Maps, such as central images, color coding, and radiant thinking. For example:

- *Spider diagrams* are typically linear and lack Mind Maps' color and imagery.
- *Concept maps* are usually linear, designed for rote memorization rather than creativity.
- *Pyramid diagrams* emphasize hierarchy in a top-down structure, lacking Mind Maps' freeform connectivity.
- *Fishbone diagrams* focus on linear cause-and-effect without the creative engagement of Mind Maps.
- *Sunburst charts* are centered around data representation, and are not suited for creative ideation.

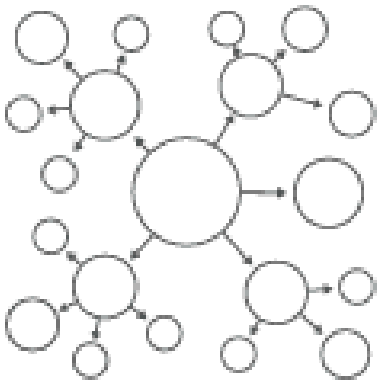
KEY QUOTES

"The more visually exciting your Mind Map, the better your results will be."

"Ensure that you never confine your thinking to a linear prison. A good Mind Mapper remains free."

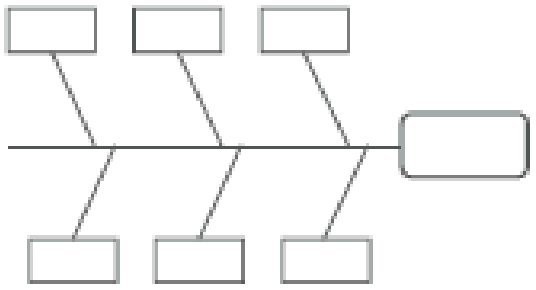


Spider diagram

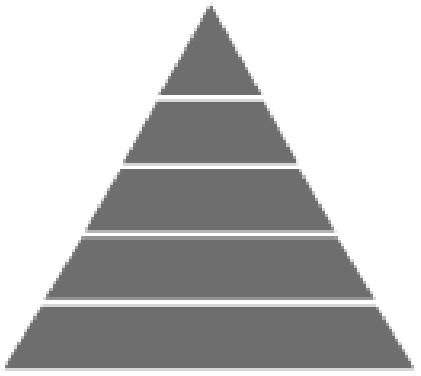


Concept map

Sunburst chart



Fishbone diagram



Pyramid diagram

A true Mind Map must meet *all* the Laws:

- ☑ Have clear central topic
- ☑ Have a central image that encapsulates the topic
- ☑ Radiates from the center One word or image per branch
- ☑ Use of visuals and color throughout
- ☑ Ideas are clearly presented
- ☑ Ideas flow organically
- ☑ Is visually appealing

Additional Tips for Mind Mapping

If you get stuck while creating your Mind Maps, start by revisiting the Laws above to check if you got the basics right. Use these strategies to address common issues:

- Ensure your central idea is *well-articulated*. A good topic or question should be clear, stimulate imagination and association, encourage open-ended exploration and critical thinking.
- Use clean, clear lines, and *simple, impactful images*. Check if your central image is colorful, eye-catching, and triggers associations in your mind. Leave ample space for ideas to stand out.

KEY QUOTES

"A Mind Map's use of colour, imagery and visual connections is informal, organic–and essential to its proper functioning."

"A Mind Map's structure mimics the brain's network of synapses and neural paths."

"A Mind Map always works when it is worked well."

- If your Mind Map seems crowded, create sub-maps or *"child" maps* to explore sub-topics without cluttering the main Map.
- *Embrace a "messy" Mind Map* as part of the creative process. Use it as a draft for refinement in subsequent versions.
- Watch out for keywords that appear on multiple branches. Such *repeated keywords* signal importance. Highlight them, and consider refocusing your Mind Map around these pivotal words.
- If you're *feeling indecisive*, weigh your options using a Mind Map. If that fails, then trust your intuition—toss a coin, observe your emotional response to the outcome, then use that to guide your decision.
- *Persist and iterate*. If a Mind Map doesn't resonate with you immediately, see it as a learning opportunity. Consider why it's not working for you, then try again.
- You can even use Mind Maps to *tackle persistent issues*. State the problem as the central idea, then branch out to explore potential solutions, support mechanisms, and action plans.

KEY QUOTES

"Through repetition, a keyword becomes a key key word or even a key key key word."

"It is always better to be proactive and to do something than to wallow unproductively in the pit of inertia."

"Persistence is key in Mind Mapping, and I would urge you to 'try, try and TRY again'!"

Use these additional tips to make your Mind Maps even more effective:

- *Don't cross out content* on your Mind Map. Instead, use ticks or positive symbols to signify that you've completed something.
- Work in *20-minute focused sessions*, followed by short breaks to keep your mind sharp and clear.
- As you learn and grow, continuously *refine and update* your Mind Maps with fresh insights and goals.
- Continuously *adapt and update* your Mind Maps as new insights emerge or as your objectives evolve.
- *Experiment* with different layouts, structure, symbols, colors, styles, and images, to find what works for you.
- Integrate Mind Mapping into your daily routine, and *make time* to practice and hone your skills.
- Combine concise *keywords with vivid visuals/colors*, to engage both the verbal and visuals aspects of your brain.

Part 2: Using Mind Maps Effectively In All Parts of Your Life

Benefits of Mind Mapping

Mind Maps can be used in all areas of life, with many benefits.

- They provide a *clear, visual overview* of a topic, making complex information easier to understand.
- They make it easier to *plan and organize* tasks, events, and schedules by visually arranging steps, priorities, and goals.
- They facilitate *knowledge and management* by serving as a repository that's easy to navigate.
- They boost *creative thinking* by stimulating imagination, innovative thinking and creative problem-solving.
- They are excellent study aids, to highlight key information for *learning and memorization*.
- They encourage *deep focus* on specific topics, to improve engagement and outcomes.
- They make *presentations* simpler and clearer, to ensure essential points are effectively communicated.
- They support *leadership and management* tasks, such as setting agendas, and managing meetings with visual overviews.
- They offer a dynamic way to plan and present *training programs*, as an alternative to text-heavy materials.
- In *negotiations*, they assist in outlining options, strategies and potential outcomes to facilitate win-win results.

KEY QUOTES

"By marrying words and images, and by mirroring the workings of the human brain in its combination of logical and creative input, the Mind Map is the perfect tool for our globalized 21st century."

"The Mind Map is a natural evolution of human thinking."

Applying Mind Mapping in Daily Life

There are 3 phases to successful Mind Mapping:

- *Acceptance*: Set aside any preconceptions about your abilities, and embrace the Laws of Mind Mapping with an open mind.

- *Application*: Use the laws to create Mind Maps in different contexts, such as note-taking, decision-making, or learning new skills. Make it a part of your daily life.

- *Adaptation*: Once you've created hundreds of Mind Maps and mastered the fundamentals, you can customize the approach to better suit your unique needs. For instance, you can adopt advanced applications, such as using Mind Maps for conflict resolution. This could involve (i) creating joint Mind Maps to explore perspectives and find common ground, or (ii) using a color-coding system to identify individual contributions and combined solutions.

In the book, Buzan walked readers through 6 key areas of Mind Map applications: for home, work, education, creativity, well-being and memory. In each area, he suggested numerous ways to use Mind Maps to achieve your goals, including detailed examples and sample Mind Maps. Use this as a foundation to explore the best ways to apply Mind Maps in your personal and professional life. Seek to master the basics, then move into advanced applications.

- *Home*: Use Mind Maps to plan personal goals, organize weekly activities, parties or vacations. Brainstorm solutions to household problems, or to enhance relationships. Examples of advanced applications include:

  (i) Facilitating communication and understanding between partners, resolving conflicts, and planning for shared goals.

  (ii) Organizing and managing the complexities of moving house, from sorting belongings to changing addresses and utilities.

- *Work*: Conduct research, write reports, improve time management and project management through Mind Mapping. Examples of advanced applications include:

KEY QUOTES

"Mind Maps can always help you find the right path–all you need to do is persevere."

"Think about the six aspects YOU would choose if you were to make a Mind Map representing the key areas in your own life."

(i) Creating a compelling CV by laying out your professional experience, skills, and achievements in a structured way.

(ii) Planning job search strategies, tracking applications, and preparing for interviews.

- *Education*: Use Mind Maps for study and revision, essay planning, creativity, and to deepen your understanding of a subject. Examples of advanced applications include:

  (i) Breaking down complex astronomical concepts into more digestible components.

  (ii) Organizing thoughts, research, and content for school projects and group work.

- *Creativity*: Generate new ideas, solve problems, and nurture creativity across all aspects of life with Mind Maps. Examples of advanced applications include:

  (i) Designing a building by visually brainstorming the architectural designs, concepts, and functional planning.

  (ii) Writing a book by structuring plotlines, developing characters, and planning chapters.

- *Well-being*: Plan your nutrition or diet, manage stress, and set fitness goals using Mind Maps. Examples of advanced applications include:

  (i) Exploring various dimensions of holistic health, such as diet, exercise, and mental well-being.

  (ii) Analyzing the roots of personal fears and develop strategies to overcome them.

- *Memory*: Improve memorization and recall, study habits, and learning efficiency with Mind Mapping techniques. Examples of advanced applications include:

  (i) Using Mind Maps as a brain gym to exercise the brain and improve cognitive functions.

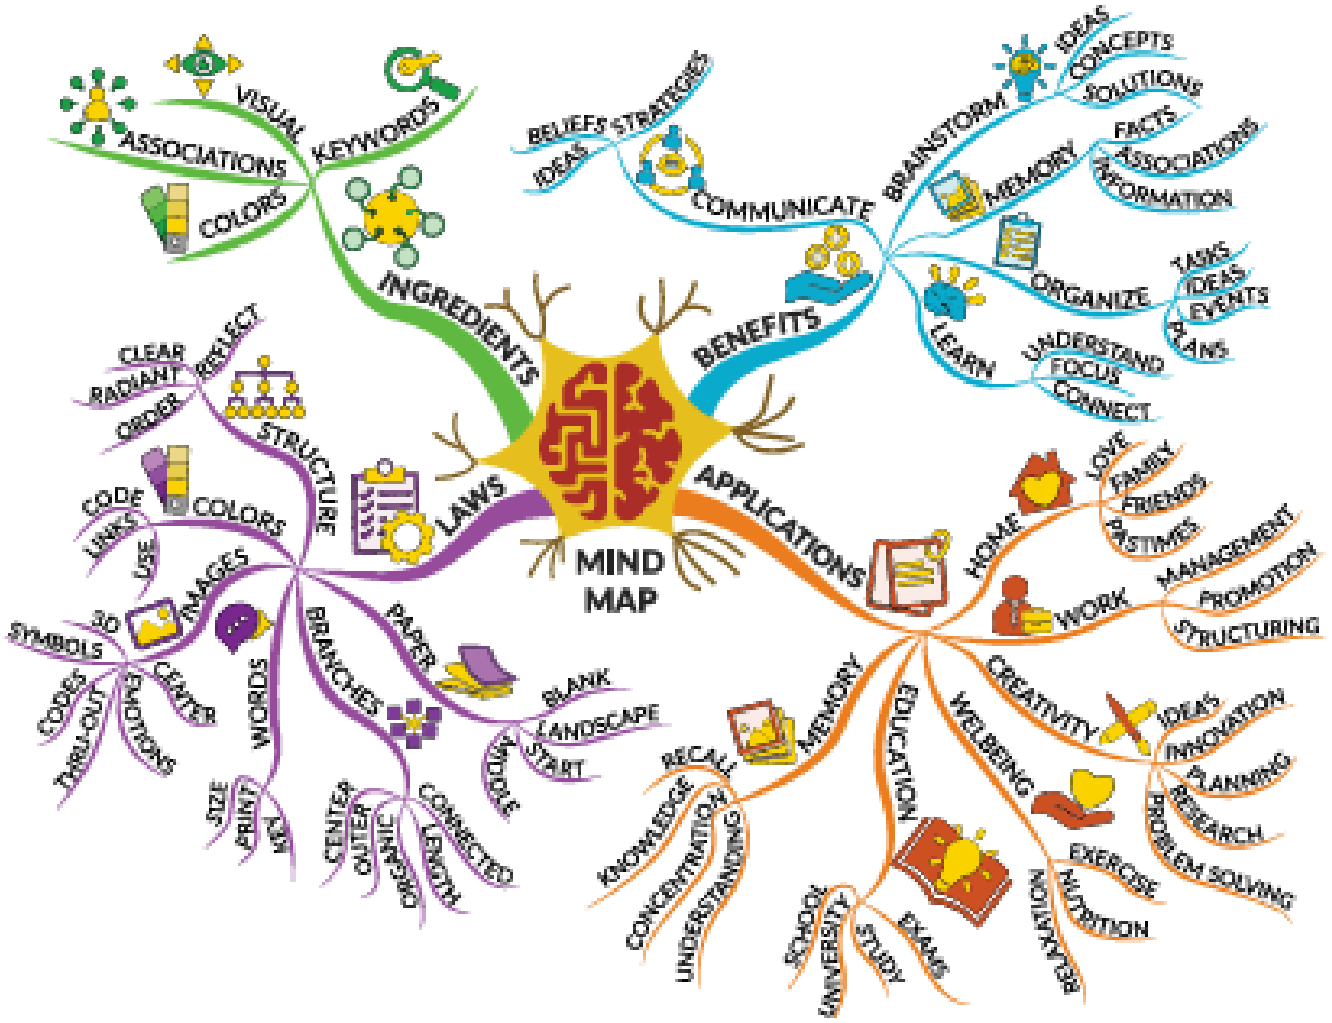
  (ii) Using Mind Maps to dissect and remember key elements of stories, plays, or films, thus improving your ability to recall a plot or storyline.

KEY QUOTES

"Creative thinking isn't the prerogative of geniuses; it is simply the ability to think in original ways and to break away from the norm."

"Make a Mind Map your Number One personal trainer!"

Essentially, there are infinite ways to apply Mind Mapping. Now, let's use a Mind Map to recap the key ideas covered so far in this summary:



KEY QUOTES

"Through its infinite applications, the Mind Map has evolved into a metalanguage: the language of language itself."

Conclusion and Other Details in the Book

Buzan anticipated that Mind Maps would continue to evolve alongside human cognition and technological advancements.

- He encouraged readers to *explore digital Mind Maps* for their editability, shareability, and multimedia integration. However, make sure your Maps adhere to the Laws of Mind Mapping. In collaboration with Chris Griffiths, Buzan also developed the iMindMap software and was venturing into 3D technology to unlock new possibilities.

- At the time of this book's publication, *artificial intelligence (AI)* could process and calculate large amounts of input, but lacked the ability to think or feel with cognitive awareness.

  (i) Buzan argued that real proof of conscious intelligence would come from an AI's ability to master the Laws of Mind Mapping to create Mind Maps, and to demonstrate an understanding of its creations.

"I sincerely believe that the ability to make a Mind Map would act as the ultimate proof of intelligence in a robotic being."

"For all of its advances in recent years, I believe that we are still only at the very beginning of Mind Mapping's digital adventure."

"Instead of using digital technologies to push the parameters of Mind Mapping, Mind Mapping could prove a way to push the potential of AI itself."

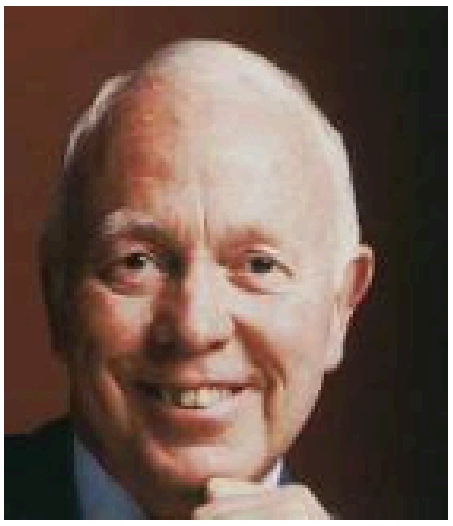
(ii) Instead of using technology to enhance Mind Mapping, he encouraged technologists to apply Mind Mapping Laws to advance AI towards human-like associative and imaginative thinking.

Treat Mind Mapping not just as a thinking technique, but as an art form that empowers you to navigate and excel in life.

- Try making a *"Change Your Life" Mind Map* to consolidate the Mind Mapping skills you've learned, and consider how you can move beyond your current circumstances to achieve your dreams and goals.

The book is filled with details on Mind Maps' origins and evolution, brain exercises, illustrations, and examples, to guide readers in applying Mind Mapping across various domains. For more details and resources, please visit https://tonybuzan.com/.

About the Author



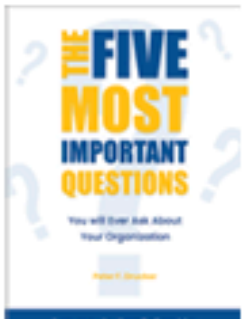
Anthony Peter "Tony" Buzan (1942-2019) was an English author and educational consultant. Buzan popularised the idea of mental literacy, radiant thinking, and the Mind Mapping technique. He was author or co-author of >80 books and wrote widely on subjects on the brain, genius quotient (GQ), memory, creativity and speed reading.

He was also the founder and co-founder of several global mental literacy and cognitive performance initiatives, such as the Brain Foundation, Brain Trust Charity, and the World Memory Championships.

KEY QUOTES

"Once you begin, I know there will be no stopping you."

"As a human being, you are a super biocomputer and your potential is incredible."



THE FIVE MOST IMPORTANT QUESTIONS

YOU WILL EVER ASK ABOUT YOUR ORGANIZATION

BY PETER F. DRUCKER
with Jim Collins, Philip Kotler, James Kouzes, Judith Rodin,
V Kasturi Rangan, and Frances Hesselbein

The Big "So What"

For many years, non-profit organizations felt that a good cause alone was enough. However, precisely because they don't have a bottomline like profit organizations, it is even more important that they are well-managed. This book provides a self-assessment process to address crucial fundamentals of what you are doing, why you are doing it, and what you must do to improve your organization's performance.

The Importance of Self-Assessment

Self-assessment is crucial to any individual or organization that's committed to becoming a leader.

It forces the organization to focus on its mission. The self-assessment process will lead to the formation of a plan, and planning is an ongoing process (not a one-off event). It requires that you make the best possible decisions today to achieve results tomorrow, to constantly review what works and what doesn't work, so adjustments can be made in light of ongoing changes.

It requires that you listen to your customers. A non-profit organization cannot support every good cause that it encounters. Instead, it must address what its customers (be it a student, donor, patient) want and value. In assessing your customers' needs, you cannot simply guess what they want. You need to talk to your customers and get their input.

It involves setting higher standards and encouraging constructive dissent. To become a force for positive change, to build future communities and change lives, you'll need to constantly challenge status quo and push for renewal/ improvement while you're successful. Important decisions should never be made when there's rapid consensus, as this means that people are avoiding the difficult discussions and decisions, and/or objections are being hidden. Instead, encourage different views and constructive dissent.

Key Quotes

"Leadership has no choice but to anticipate the future and attempt to mold it."

"The mission inspires; it is what you want your organization to be remembered for."

"You cannot arrive at the right definition of results without significant input from your customers...The danger is in acting on what you believe satisfies the customer."

"True self-assessment is never finished. Leadership requires constant resharpening, refocusing, never really being satisfied."

These ideas are expanded upon in the 5 essential questions for self-assessment outlined below. The 5 questions by Drucker have withstood the test of time, and are presented in the book alongside additional inputs from other thought leaders.

1 "What Is Our Mission?"

The mission captures the purpose of an organization's existence. It has to encapsulate something that you believe in, at a deep and personal level, such that everyone in the organization understands and lives it.

In defining your mission, you must consider:

- Your present mission
- Your challenges
- Your opportunities
- Whether your mission must be revisited

For non-profit organizations, changing lives must be at the core of their missions. An effective mission statement:

- Is broad and focuses on shaping the future;
- Is so short and focused it can fit on a t-shirt;
- Is centred on "why" and not "how"; and
- Reflects the point where opportunities, organizational competence and commitment converge.

Preserve the core while progressing dynamically

Jim Collins shares that an organization's mission guides it on what to do and what *not* to do. Great organizations concurrently preserve their core, while stimulating progress. They are crystal-clear and unwavering in their mission or core ideology, but dynamic in how they manifest the mission, including changing the operating practices, tactics, strategies, processes, techniques or cultural norms to keep pace with changing realities.

Key Quotes

"A mission cannot be impersonal; it has to have deep meaning, be something you believe in–something you know is right."

"A fundamental responsibility of leadership is to make sure that everybody knows the mission, understands it, lives it."

"The mission transcends today but guides today, informs today."

"Every mission statement has to reflect three things: opportunities, competence, and commitment."

"(People) have a desperate need for a guiding philosophy, a beacon on the hill to keep in sight during dark and disruptive times."
- Jim Collins

Human beings have a fundamental need for belonging and a deeper sense of purpose. As the world becomes more disruptive and unpredictable, a clear mission helps people to feel that they are standing for something they believe in.

2 "Who is Our Customer?"

Only when you have clearly identified your customers can you focus on satisfying their needs. Yet, leaders are often unsure who exactly their customers are, and / or fail to place their customers as the priority. To identify your customers, ask yourself this question "For my organization to be considered successful, who must be satisfied?"

In defining your customers, consider

- Who your primary customers are
- Who your supporting customers are
- How these customers will change

Primary customers. You should have only *one* primary customer, and this is the customer whose life will be changed due to your organization's work. Drucker gave the example of a non-profit organization that focused on "the person with multiple barriers to employment" – over time, this single definition led them to impact different groups of people, from the physically disabled to single mothers to the chronically ill. Identifying your primary customers gives you great clarity for prioritization and decision making.

Supporting customers. You will have *many* supporting customers - including your employees partners, members, etc. – and you must satisfy all of them. When you change your primary customers, you will also create a different circle of supporting customers.

Know your (ever-changing) customers. Your customers (be it their demographics, numbers, needs etc.) will change over time, as will the opportunities for you to serve them (due to changes in technology, environment etc.). The key is to get to know your customers, and to continuously adapt and learn as they change. You should also examine when to *stop* serving specific groups of customers.

Key Quotes

"You define your customer as one who values your service, who wants what you offer, who feels it's important to them."

"Our business is not to casually please everyone, but to deeply please our target customers."
-Philip Kotler

"Your success ultimately depends on what you have contributed to the success of your customers."
-Philip Kotler

Don't attract Customers; Develop Fans

Philip Kotler adds that, it is no longer enough to try and attract customers. The new paradigm of thinking is about choosing your target customers carefully, and satisfying them so well that they become your fans. To do this, you need to:

- Understand the customer buying process - including who is the initiator, influencer, decider and the purchaser - then seek to reach the most influence people in this decision-making process.

- Go beyond data in the customer relationship management process to actually capture and improve the quality of customer experience.

3 "What Does the Customer Value?"

We must understand our customers' needs, wants and aspirations. Yet, these are complex questions that can be only addressed by the customers themselves.

To address this question, consider these about your primary and supporting customers:

- What assumptions you may have about what they value
- What knowledge you must gather to ascertain what they value
- How you can gather this information

Don't assume or infer. In their own eyes and realities, customers always behave rationally; we can only see the logic of their decisions when we see things from their perspectives. To deliver what our customers value, we need to first become aware of our own assumptions or interpretations of what the customers value.

Plan around your customers. To integrate what customers value into your organizational plan, you need to shift the way your organization thinks. Consider your knowledge gaps, then listen and objectively accept what the customers are telling you about their needs and wants. Ensure their voice is an integral part of all your deliberations and decisions.

Key Quotes

"The first rule is that there are no irrational customers."

"Listen to customers, accept what they value as objective fact, and make sure the customer's voice is part of your discussions and decisions, not just during the self-assessment process, but continually."

"People are so convinced they are doing the right things and are so committed to their cause that they come to see the institution as an end in itself. But that's a bureaucracy."

Dare to change the status quo

Jim Kouzes adds that, creating value for the customers means solving their problems. This requires not just an ability to listen, but also the courage to challenge the norms and change what's familiar and stable in your business, to deliver what customer truly want.

4 "What Are our Results?"

In a profit organization, one of the measurements of success is obviously profits. Without it, business is not sustainable in the long run. However, for non-profit organizations, success must be defined and measured differently.

In addressing this question, consider:

- How you currently define results
- If you are really successful
- How you should define results
- What you must enhance or discard

Use qualitative and quantitative measures. You can measure your process and results in both qualitative and quantitative terms. Qualitative indicators look at how deep and wide your impact goes, and can be collected and presented in the form of stories which capture patterns, observations and intangible benefits like "hope" and "inspiration". Quantitative measures involve "hard data" like number and statistics to access if certain standards or goals are met.

Enhance what works and discard what doesn't. With clearly-defined measures, you can identify what you must strengthen, i.e. where to invest resources such that you will get multiple times the results. However, it is equally important to identify what you must discard, without which your resources cannot be optimally deployed. It is not good enough to put resources in an area due to tradition or need – the only reason to invest resources is if it can produce outstanding results.

Key Quotes

"Organizations of the future are relevant and sustainable with measurable results."

"The results of social sector organizations are always measured outside the organization in changed lives and changed conditions – in people's behaviour, circumstances, health, hopes and above all, in their competence and capacity."

"To abandon anything is always bitterly resisted...Yet, abandonment comes first. Until that has been accomplished, little gets done."

Results are both a goal and a test

Judith Rodin points out that, while our long-term mission is important, measurable results in the short term tells us whether our short-term plans are working, and allow us to make midcourse corrections to get better results toward our long-term goals. In other words, results are both a goal in itself, as well as a test of whether we are ontrack to accomplishing our wider mission.

5 "What is Our Plan?"

The process of self-assessment generates a plan, which articulates where you want to be and how you intend to get there. It includes the organization's mission, goals, action steps, budget and appraisal. Since no one can predict the future, the plan needs to keep evolving. Keep asking "What do we want to be remembered for?"

Board vs Management. The board's role is to focus on the mission, goals, resource allocation, and progress review to keep the organization ontrack. The management, on the other hand, is responsible for objectives, action steps and driving results.

Key Quotes

"Planning is not an event. It is the continuous process of strengthening what works and abandoning what does not, of making risk-taking decisions with the greatest knowledge of their potential effect, of setting objectives, appraising performance and results through systematic feedback, and making ongoing adjustments as conditions change."

Goals, Objectives and Budget. An organization should only have a few, and no more than 5, fundamental goals that are approved by the board. Your goals must be rooted in your mission (and by extension, address what opportunities and strengths you'll leverage and where you are going). Your objectives are specific, measurable achievements that will move you towards your goals, including the effective use of the budget approved by the board.

Getting buy-in. Everyone who has a role in the plan should be given the chance to provide inputs – this creates buy-in and understanding of the plan.

In addressing this question, consider:

- If the mission should be changed
- What your goals are

An effective plan comes with 5 ingredients:

Abandonment. Constantly ask "If we were not already doing this today, would we go into it?". If something doesn't work or no longer works, discard it as soon as possible.

Concentration. Focus on what works, and challenge yourself by asking "Can we set and achieve an even higher standard"?

Innovation. Consider the opportunities, emerging issues and conditions of the future, and ask "What do our customers value and how can we make a difference?"

Risk-Taking. Planning inevitably involves decisions and risks. It's a fine line between being too conservative and taking on too much risk, and unfortunately, there's no one-size-fits-all solution.

Analysis. If you are unsure whether to abandon, focus, innovate or take risk, it means you need to conduct further analysis

Key Quotes

"Goals make it absolutely clear where you will concentrate resources for results – the mark of an organization serious about success."

"With genuine participation, a decision doesn't need to be sold...the decision itself becomes a commitment to action."

The plan as the start and not the end

V. Kasturi Rangan highlights that a plan should not be treated as a perfect blueprint for execution. Rather, it is just a starting point for management to refine, adapt and learn. An effective plan:

- Is goal-focused, helping the organization to measure its progress towards its overarching mission.
- Is unwavering in its strategic direction but flexible in execution, with a strong learning focus and constant exploration of possible paths.
- **Has individual ownership and accountability.** The plan should be developed with the involvement of those responsibility for its execution and results. First, name the individuals, then give them autonomy and flexibility to develop the plan that they will eventually be accountable for.
- **Is monitored for improvement.** Not all programs will be equally successful. Close monitoring helps to identify which programs contributed results, which ones didn't, and why, so the lessons can be ploughed back into the design of future programs.

Key Quotes

"While the overarching mission might be broad and inspirational, the operating mission must be narrow enough to allow the organization to measure its progress against goals."

- V. Kasturi Rangan

Transformational Leadership

Frances Hesselbein identified 8 milestones that any organization will cross in the process of becoming a truly effective institution:

Scan the environment to identify and understand major emerging trends that affect the organization;

Review the mission at least every few years, asking the first 3 of the 5 questions to ensure your mission is still on point;

Banish hierarchy, so people are not confined into rigid organizational roles. Use job rotation and other ways to fluidly facilitate the expansion of roles and perspectives;

Challenge "the way things are", to identify sacred cows (e.g. programs, policies, practices etc.) that should be discarded;

Communicate powerfully, by reinforcing a few clear and consistent message to all customers and stakeholders;

Develop organization-wide leadership, such that leadership is a shared responsibility and leaders are developed across all levels of the organization;

Lead by example, with leaders leading from the front as role models of desired behaviours;

Assess performance, using the last 2 of the 5 questions to measure and assess how you are doing.

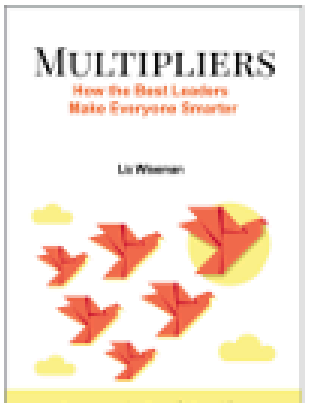
Other Useful Details in the Book to Look Out For

The book was originally written with social or nonprofit organizations as the focus, though the ideas are applicable to any organization or institution that wishes to achieve excellence.

The 5 questions may appear simple, but are certainly not easy to answer. Drucker encourages you to take time to reflect upon each question and allow yourself to consider them carefully. Proper self-assessment could take weeks, if not months to complete, and the process is never finished as leaders constantly refocus and refine.

To aid you in your thinking process and to facilitate discussions, the book comes with a workbook with additional questions and exercises.

Key Quotes



MULTIPLIERS

How the Best Leaders Make Everyone Smarter

LIZ WISEMAN

The Big "So What"

Why do some leaders create a positive impact on people around them while others don't? This book presents the characteristics of Multipliers who amplify the results of people around them (vs Diminishers who reduce others' results). It also lays out practical tips, experiments and steps you can take to become a Multiplier and build a Multiplier culture.

Introduction: The Multiplier Effect

Based on research of more than 150 executives across 4 continents, Wiseman discovered that leaders can be placed on a spectrum between two extremes: Multipliers vs Diminishers.

- *Multipliers* are leaders who bring out others' capability and intelligence. They're "genius makers" who multiply an organization's collective intelligence.
- *Diminishers* are leaders who're so absorbed in their own genius that they stifle others', thus depleting the organization's vital intellectual resources.

Wiseman's research found that managers used on average only 66% of their people's capability. Interestingly, Multipliers get 2x more out of people than Diminishers.

- Multipliers concurrently *extract and expand* people's intelligence. People around Multipliers feel like winners. They're inspired to give 100% of their creativity/effort *and* to stretch themselves beyond their original capacity. By contrast, people around Diminishers get their ideas squashed until they eventually shut down or quit.

KEY QUOTES

This book will show you why [Multipliers] create genius around them and make everyone smarter and more capable."

"It isn't how much you know that matters. What matters is how much access you have to what other people know. It isn't just how intelligent your team members are; it is how much of that intelligence you can draw out and put to use."

This book will show you why [Multipliers] create genius around them and make everyone smarter and more capable."

- Multipliers adopt the *Logic of Multiplication*. They recognize that you can multiply results by leveraging existing capabilities instead of adding new ones. Diminishers adopt the Logic of Addition which assumes a linear relationship between resources and output. They may get the job done, but with a huge waste of resources.

The 5 Disciplines of Multipliers

The difference between Multipliers and Diminishers come from their **difference in mindsets**. Diminishers assume that people can't figure things out without them, while Multipliers assume that people are smart and can work things out. Such assumptions drive their behaviors differently in 5 key ways.

	MULTIPLIERS	DIMINISHERS
ASSUMPTION	"People are smart and can figure things out."	"People can't figure it out without me."
BEHAVIORS / DISCIPLINES	**Talent Magnets** Hire talented people, use/develop them fully, and help them to succeed. People thrive and a Cycle of Attraction is created.	**Empire Builders** Hire talented people but underutilize them. Hoard resources for own gain. Talents are stunted, results suffer, and a Cycle of Decline is created.
	Liberators Create an intense environment that demands people's best performance. They create stability so people are free to think/act boldly and focus on their work.	**Tyrants** Create a tensed environment that crushes people's ability to think/perform. They create anxiety so people act cautiously and are afraid to speak up.
	Challengers Define opportunities in a way that motivates people to stretch themselves beyond existing know-how, discover and execute optimal solutions.	**Know-it-Alls** Define directives, show off their superior insights and tell people what to do. People second-guess the boss and are stuck with what they already have/know.
	Debate Makers Engage people in rigorous debate to arrive at sound decisions. People are challenged, own and understand the decisions made.	**Decision Makers** Make decisions by themselves or their inner circle, dominate discussions and force through decisions, leaving others feeling uninvolved and confused.
	Investors Investors build people's ownership and ability to perform without them. They share insights but give back the accountability.	**Micromanagers** Diminishers try to do everything personally. They jump in and out, creating confusion and overdependence on them.
RESULTS	Get 2X results out of people	Get <50% results out of people

KEY QUOTES

1. The Talent Magnet: Attract and optimize talent

Empire Builders vs Talent Magnets. Both Multipliers and Diminishers seek to attract A-players, i.e. great people with the required talents and abilities for the job. However, they manage these talents differently to create a *self-perpetuating cycle*:

- Diminishers act like *Empire Builders*. They hoard resources and underutilize talents. They bring in top talent to make themselves look good and build their own career, carve out fiefdoms and position themselves as the sole integrator and decision-maker. The A-players are underutilized, their talents stunted, and the team's performance suffers. As word spreads, it gets harder to attract good people and a *Cycle of Decline* is created.

- Multipliers are *Talent Magnets*. They hire talented people, use and develop their strengths fully, and remove obstacles to help people succeed. Both the individuals and team thrive, word spreads that they're the best bosses to work for, and more talents flock to them to create a *Cycle of Attraction*.

Talent Magnets attract and nurture talents with 4 practices.

- They *look for diverse talent everywhere*. Specifically, they:

  (i) *Value all types of talents* (e.g. quantitative analysis, creative problem-solving); and

  (ii) *Ignore organizational boundaries* to seek talents inside and outside the organization.

- They *find and unlock people's native abilities*, be it a knack for connecting people or diagnosing complex issues. They:

  (i) Carefully observe people to *identify what's native* to them, i.e. things that people do (a) easily without conscious effort and (b) freely without condition.

  (ii) *Label the ability* to make it obvious. Talents often don't realize their own genius. Labeling it raises their awareness, confidence and the likelihood that they'll use it.

KEY QUOTES

"The Diminisher is an Empire Builder who acquires resources and then wastes them. The Multiplier is a Talent Magnet who utilizes and increases everyone's genius."

"[Diminishers] actively acquire talent, but then are passive about growing it."

"Talent Magnets live in a world without walls and without hierarchical or lateral restrictions. Instead, they see talent networks."

"Finding someone's native genius is a key that unlocks discretionary effort. It propels people to go beyond what is required and to offer their full intelligence."

- They *utilize people to the fullest*. Specifically, they:

  (i) *Connect people with opportunities* to use their native ability.

  (ii) *Shine a spotlight on them* so others can see them in action. This builds their character and confidence even further.

- They *remove blockers* that hinder people's growth/success:

  (i) *Remove prima donnas* who persistently put their egos over the team's interests (thus hurting team effectiveness).

  (ii) *Get out of the way* if they themselves are the blockers.

To become a Talent Magnet, start by (i) becoming a genius watcher and (ii) weeding out people who're bad for the team. Try these 3 experiments:

- *Name the genius*: Find the native genius of every team member. Or, consider someone hard to work with and ask "in what way is this person smart?"

- *Upsize their role*. Give people a role/project that's slightly bigger than their current capabilities, and let them grow into it.

- *Let superstars go*. When people have outgrown their roles, encourage them to move on. Don't keep them for your own gain. At the same time, don't wait to remove people who're bad for the team.

2. The Liberator: Demand people's best thinking and effort

Tyrants vs Liberators. Diminishers use their hierarchical position to suppress others. Multipliers free people to think, speak up and do their best work.

- Diminishers are *Tyrants* who create a tensed environment that crushes people's ability to think and perform. They insist on their views, shut out others' ideas, dominate the space, and create anxiety by constantly judging others. People are afraid to speak up and act cautiously to avoid coming under fire.

KEY QUOTES

"Removing a highly intelligent employee or leader can be difficult, but it can have huge payoffs...You may lose one mind, but you gain back five. It is a law of numbers."

"The Diminisher is a Tyrant who creates a stressful environment. The Multiplier is a Liberator who creates a safe environment that fosters bold thinking."

- Multipliers are *Liberators* who create an intense environment that demands people's best performance. They're hard on the issues but easy on the people. They provide the stability for people to focus on their work, and make it safe for people to be bold in their thinking and actions.

Liberators balance between the duality of giving people space and demanding their best effort with 3 practices:

- They *create space* for people to perform. They:

  (i) Deliberately *restrain themselves so others can shine*. They guide others to succeed instead of jumping in to do the work.

  (ii) *Listen avidly* with a deep desire to understand and learn from others. In a typical conversation, they spend 80% listening or asking questions instead of talking.

  (iii) *Define a space for discovery*, i.e. specify projects or boundaries within which people can take risks freely.

  (iv) *Level the playing field* so it's easier for disadvantaged parties (e.g. junior staff or people from other teams) to be heard.

- Liberators don't stop at beating a rival or meeting a deadline; they *demand the best work* from their people. They:

  (i) *Uphold the standard* by constantly asking "Did you give you best?" or "Is this your best work?"

  (ii) *Separate best effort from outcomes*, i.e. hold people accountable to their best work instead of insisting on a fixed outcome (which may be beyond their control).

- *Create fast learning cycles* by learning from mistakes. They:

  (i) Openly *admit and share their mistakes*, making it safe for others to also take risks and fail, e.g. they may tell stories about their failures and what they learned in the process.

KEY QUOTES

"An unsafe environment yields only the safest ideas... People's best thinking must be given, not taken."

"How smart you are is defined by how clearly you can see the intellect of others."
—C. K. Prahalad

"As a leader, you have to do more than just not discourage it, you need to actively encourage people to speak up."

"Asking whether people are offering their best gives them the opportunity to push themselves beyond previous limits."

"The highest quality of thinking cannot emerge without learning. Learning can't happen without mistakes."

(ii) *Insist on learning from mistakes*, i.e. it's ok to make mistakes but not make them twice. They invite feedback to improve.

To become a Liberator, try these experiments:

- *Play your chips*. Give yourself a few poker chips, each worth a different amount of talk-time (e.g. 30s, 90s, 120s). Use these to budget your talk-time at each meeting, so you're forced to choose your contributions wisely and leave space for others.

- People often can't tell if a leader is sharing a casual thought or a policy decision. *Label your opinions* to distinguish soft opinions (meant for further consideration/ debate) versus hard opinions (firm views on a vital issue).

- *Share your mistakes*, making it safe for others to experiment and learn from mistakes: (i) Get personal by sharing the mistakes you made and what you learned, and (ii) go public by creating forums where everyone can learn regularly.

- *Make space for mistakes*. Define an area or project where it's ok to experiment and fail without hurting the organization.

3. The Challenger: Extend compelling challenges

Know-It-Alls vs Challengers. In setting the direction for their team:

- Diminishers are *Know-It-Alls*. They tell you their superior insights, ask questions to "test" you, and tell you exactly how to do your job. People waste energy second-guessing them or pretending to follow their instructions, and the organization is stuck with what it already has/ knows.

- Multipliers are *Challengers*. They identify the right opportunities, then challenge everyone to get there. They seed ideas and let people stretch themselves to find the solutions. Matt McCauley assessed that Gymboree's share price could be increased from $0.69 per share to $1.

KEY QUOTES

"The Diminisher is a Know-It-All who gives directives. The Multiplier is a Challenger who defines opportunities."

Even though he knew what could be done, he chose to share his "Mission Impossible" and enlist his managers to come up with *their* Mission Impossible. One year later, Gymboree reached $1.19 per share. Matt kept lifting the bar to reach $2.15 per share in 2007, then $3.21 in 2008.

Challengers tap on the entire organization's abilities with 3 practices:

- They *seed the opportunity* by asking good questions and giving just enough info to stretch people's thinking. They:

  (i) *Show the need by finding ways* for people to see/discover the problem themselves. Once people understand an issue, it's easier to find solutions.

  (ii) *Challenge assumptions* by asking questions that disrupt the prevailing logic. Management guru C.K. Prahalad used a fictitious article about Philips' bankruptcy (at a time when the company seemed invincible) to spark debate on what could cause their downfall.

  (iii) *Reframe problems* to show new opportunities. When Alan Lafley (former P&G CEO) redefined innovation from "not invented here" to "proudly invented elsewhere", it opened up new partnership possibilities.

  (iv) Offer a *starting point* instead of giving the solution. By sparking people's curiosity and imagination, you can create even bigger/better outcomes.

- Challengers *lay down an intriguing challenge* that motivates people to stretch and find answers they don't yet have. They:

  (i) *Extend a concrete challenge* to help others visualize what the organization must deliver.

  (ii) *Ask hard questions* that push people to think deeply, realize the gap in their knowledge/abilities, and seek to close the gap.

  (iii) Back off to *let others fill in the blanks*. They let people think for themselves and take ownership of the problem.

KEY QUOTES

"Once a leader accepts that he or she doesn't have to have all the answers, he or she is free to ask much bigger, more provocative, and, frankly, more interesting questions. They can pursue things they don't know how to do."

"Multipliers don't give answers. Instead they begin a process of discovery."

"Multipliers analyze problems, but they also reframe them to show the opportunity presented by the challenges."

"Diminishers give answers. Good leaders ask questions. Multipliers ask the really hard questions."

- They *create belief that the challenge is achievable*, so people will actually take action. They:

  (i) *Helicopter down to reality* by showing a viable path and why it's possible to achieve an ambitious goal.

  (ii) Get people to *cocreate the plan* so they'll have greater belief and ownership.

  (iii) *Orchestrate small, early wins* to build confidence.

To become a Challenger, try these experiments:

- *Take the "Extreme Questions Challenge"* by speaking to your children or colleagues only in questions. Once you're comfortable to lead with questions, balance it with your natural style.

- *Set your team a stretch challenge*, e.g. How can we achieve X by Y date, with only Z resources? Then, step back and let them solve it.

- *Take a field trip*, i.e. bring people offsite for first-hand learning experiences, e.g. see how the poor really live, or watch how a customer uses your product.

- *Take a huge baby step*. Involve the entire organization in a small win, e.g. use a cross-functional task force to win back a vital customer. Make it visible to build belief organization-wide.

4. *The Debate Maker: Debate decisions constructively*

Decision Makers vs Debate Makers. Diminishers tend to make decisions by themselves (or with a privileged few), while Multipliers engage people in meaningful.

- Diminishers are *Decision Makers*. They assume that only a few people are worth listening to. They raise issues, dominate the discussions with their own opinions, and make snap decisions without explaining the rationale. Others in the organization end up feeling confused and left out.

KEY QUOTES

"The number one difference between a Nobel Prize winner and others is not IQ or work ethic, but that they ask bigger questions."
—Peter Drucker

"Multipliers create a meaningful proof point that a bold challenge can be successfully met."

"Diminishers are Decision Makers who try to sell their decisions to others. Multipliers are Debate Makers who generate real buy-in."

- Multipliers are *Debate Makers*. They bring people together, draw out what they know, and facilitate rigorous debate. They stretch people, depersonalize decisions, and make sound decisions which people own, understand and can execute.

Multipliers spark constructive debate with 3 practices.

- They *frame the issue* clearly so people know where to focus and are given time to prepare for the discussion. They specify:

  (i) *What* is the decision to be made (ideally, specify 2 options instead of a vague topic);

  (ii) *Why* it's important to resolve the issue;

  (iii) *Who* will be involved in the decision-making; and

  (iv) *How* will the final decision be made, e.g. by majority vote, consensus or a single person.

- They *spark a debate* that's engaging, comprehensive, fact-based and educational. They concurrently:

  (i) *Create safety* by removing factors that'd cause people to hold back (e.g. sharing their views last); and

  (ii) *Demand rigor* by encouraging all points of view, focusing on facts/evidence and depersonalizing the issues.

- They focus on the goal and *drive a sound decision*. They:

  (i) *Reclarify the decision-making process* by summarizing the key ideas/outcomes and the next steps.

  (ii) *Make the decision* if consensus isn't possible or necessary.

  (iii) *Communicate* the decision and rationale.

Become a Debate Maker by using "shared inquiry":

- *Ask the hard question* that'll tackle the root of an issue and confront underlying assumptions. Stop and let the team discuss.

KEY QUOTES

"It is better to debate a decision without settling it than settling a decision without debating it."
—Joseph Joubert

"Multipliers love debate, and they debate with a purpose.... Multipliers aren't just debaters; they are Debate Makers."

- *Ask for evidence* whenever someone offers an opinion, and consider multiple data points or trends.

- *Ask everyone* for their inputs or at least get diverse views. Go beyond the dominant voices.

- *Ask people to switch sides* to consider the issue from a different viewpoint, e.g. taking an opposite stand or a different role.

5. The Investor: Instill accountability

Micromanagers vs Investors. Diminishers drive results personally while Investors build people's ability to perform without them.

- Diminishers are *Micromanagers*. They try to handle everything themselves. They issue instructions, then intervene thinking people can't cope without them. They create confusion by jumping in and out. People become dependent on them and can't operate in their absence.

- Multipliers are *Investors*. They share guidance, invest in others' success, but give back the ownership for results. They're like coaches who build a winning team without jumping in to play the game themselves.

Investors build independent teams with 3 practices:

- They *establish ownership* upfront. They:

  (i) Recognize people's abilities, *name the lead* and give them full accountability.

  (ii) Give people ownership for a *wider end-goal* that goes beyond their narrow/specific domains.

  (iii) *Stretch the role* by getting people to go beyond their comfort zone and do things they've never done before. Set challenges at 1-2 levels above their current ability.

- After establishing ownership, they *invest resources* and knowledge to ensure people can deliver results. They:

KEY QUOTES

"The Diminisher is a Micromanager who jumps in and out. The Multiplier is an Investor who gives others ownership and full accountability."

"You can jump in and teach and coach, but then you have to give the pen back…[so] your people know they are still in charge."
—Jae Choi

"When Investors stretch the role, they stretch the person in it. This bigger role creates a vacuum that must be filled."

(i) *Teach and coach* people so they can avoid/solve problems in the future.

(ii) Know people will make mistakes, thus *provide backup* through other colleagues' support.

- They *hold people accountable* for their areas of ownership. They:

  (i) Always give *back the accountability* after offering help, suggestions or resources.

  (ii) *Expect completed work*, including solutions for every problem raised.

  (iii) *Respect natural consequences* by letting people own the outcomes—be it success or failure.

To become an investor, try these 4 experiments:

- Give people *51% of the vote* so they know they're in charge. Start with their current job scope then keep increasing their responsibility.

- *Let nature take its course* instead of jumping in to intervene. Look for teachable moments, e.g. when the team hits a snag and is looking for help. Ask good questions and focus on how they can succeed in future.

- Whenever someone raises a problem, *ask for their recommended fix*. Don't solve it for them.

- After offering insights or opinions, always *give back the accountability*.

Becoming a Multiplier

Accidental Diminishers

Most Diminishers actually have good intentions and are unaware of their diminishing impact on others. Learn to recognize these common Accidental Diminisher profiles:

KEY QUOTES

"Diminishers tell you what they know; Multipliers help you learn what you need to know."

"Multipliers never do anything for their people that their people can do for themselves."

"We judge others by their doings, but ourselves by our intentions."

- The *Idea Guy* is creative and innovative. He shares his ideas to stimulate others, but the team is fatigued from chasing his ideas.

- *Always On* leaders are dynamic and think their energy is infectious. In reality, they drain others with incessant noise.

- The *Rescuer* jumps in once he sees people struggling and ends up limiting others' ability to learn and grow.

- *Pacesetters* are achievement-oriented. They lead by example expecting others to follow, but they move too fast and others just end up watching as bystanders.

- The *Rapid Responders* move so quickly (to make decisions or solve problems) that others sit back and let them handle it all.

- The *Optimist* focuses only on the upside and doesn't recognize the problems and effort required to solve them.

- The *Protectors* shield their people from problems so they don't learn to fend for themselves.

- The *Strategist* thinks big but people end up relying on him to show the way.

- The *Perfectionist* strives for excellence but ends up discouraging people with his nit-picking.

All of us have our Accidental Diminisher moments. The key is to lead with intention: be aware of your natural tendencies, seek feedback from others, and overcome such tendencies using the various workarounds or experiments provided earlier. As a rule of thumb, *do less and challenge more*: resist jumping in to rescue others, speaking to fill the silence, or trying too hard to sell your ideas.

Dealing with Diminishers

Even if your boss is a Diminisher, you can still break the vicious cycle with a Multiplier mindset. Realize 3 things: (i) it's not necessarily about you, (ii) diminishing effects are not inevitable, and (iii) you can lead your boss.

KEY QUOTES

"As leaders, sometimes we are most helpful when we don't help."

"As leaders, sometimes the faster we run, the slower others walk."

"Sometimes a 90 percent solution executed with 100 percent ownership is better than getting it 100 percent right with a disengaged team."

Here are 3 levels of strategies for dealing with Diminishers, in increasing levels of sophistication:

- *Level 1: Defensive/survival strategies* to stop a downward spiral.

  (i) Don't ignore the person (especially if it's your boss), but *turn down the volume* to reduce the impact.

  (ii) *Build other connections* to balance their influence, e.g. have a sounding board, a cheer squad or a career network.

  (iii) Don't fight the Diminisher head-on. *Retreat and regroup*, giving both sides the chance to exit gracefully.

  (iv) *Send the right signals* to assure a micromanager things are under control.

  (v) *Assert your capability* politely, e.g. "Can I try this by myself first and come back to you if I need help?"

  (vi) *Ask for performance intel*, including a clear direction and performance feedback.

  (vii) If all else fails, *shop for a new boss* and take the time to find the right one.

- *Level 2: Offensive strategies to multiply upward or sideways*.

  (i) *Tap on your boss's strengths* instead of trying to change him/her.

  (ii) *Proactively share* how they can best use your natural abilities.

  (iii) *Listen to their inputs* instead of dismissing them.

  (iv) Set the right tone by *admitting to your mistakes* and sharing what you've learned.

  (v) Offer to *take a stretch project* beyond your existing scope.

  (vi) Share data and *involve the Diminishers* instead of shutting them out.

KEY QUOTES

"If you do quit, don't just swap one bad manager for another. Instead of simply searching for a new job, go shopping for your next boss."

- *Level 3: Strategies to inspire Multiplier leadership*, i.e. help others to recognize their Diminisher tendencies so they can change.

  (i) *Assume positive intent*, e.g. tell a Protector "I know you want to protect the team. But if you don't give them a chance to fend for themselves, they won't learn or grow stronger."

  (ii) *Address one issue at a time* instead of overwhelming them with all the issues at once.

  (iii) *Celebrate every progress*, no matter how small.

Putting It Into Practice

Being a Multiplier is a matter of choice. It starts with (i) recognizing the Multipliers/Diminishers around you, (ii) recognizing the Accidental Diminisher tendencies in yourself, and (iii) making a firm decision to become a Multiplier.

To translate Multiplier insights into results more quickly:

- Start by adopting a *Multiplier mindset*. Your assumptions will drive your behaviors.

- Wiseman found that most Multipliers are strong in only 2-3 of the 5 disciplines (and average for the rest). So, *work the extremes* by (i) mitigating your biggest weakness (your worst Diminisher tendencies), and (ii) enhancing your biggest strength (your strongest discipline).

- *Choose 1 experiment* to improve a Multiplier discipline or reduce an Accidental Diminisher tendency. If you're unsure where to start, ask a colleague to choose an experiment for you.

- *Be prepared for setbacks*, since it will take persistent effort before you can successfully make the shift to become a Multiplier.

To create a Multiplier culture, you need to address various cultural layers that affect how people think, behave and

KEY QUOTES

"Building a culture is neither a one-time injection nor a sheep dip; it requires connection to the deep layers of the culture…from surface-level cultural elements to…the deeper cultural elements."

work. This includes both visible elements (e.g. shared language/behavior) and subtler elements (e.g. rituals, norms and beliefs):

Cultural Elements	Multiplier Practices
Common language: Words or phrases with a shared meaning	• Get the team to read this *book* and discuss it. • Get people to take the *Accidental Diminisher quiz* and discuss their self-assessments.
Learned behaviors: A set of learned responses to certain stimuli	• Explain *Multiplier mindsets* to spark internal dialogue. • Teach *Multiplier skills/practices* with 360° assessments to help leaders identify and monitor areas for improvement. • Use simulations to let people apply the insights in *daily decisions*.
Shared beliefs: What's accepted as the "truth"	• Have a *leadership ethos* to make your Multiplier beliefs explicit.
Heroes and legends: Stories about heroic actions or people who're admired/idealized	• Create internal heroes by *shining a spotlight* on Multiplier examples/moments. • Use *measurements* to assess how far managers are displaying Multiplier behaviors.
Rituals and norms: Consistent behaviors followed by an individual or group	• Pilot a *Multiplier practice* in a small group before implementing it organization-wide. • Link Multiplier behaviors to business *metrics and KPIs*.

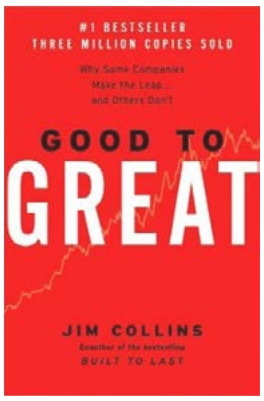
Other Details in the Book to Look out For

This is a comprehensive guidebook with numerous real-life examples for each set of Multiplier and Diminisher characteristics. The book also includes several appendices with additional information on the research process, commonly asked questions, team discussions and the various Multiplier experiments outlined in this summary. For more details and resources, please visit thewisemangroup.com.

KEY QUOTES

"Unlocking individual potential is not just a matter of personal will and individual behavior change; it is a function of entire systems, and reshaping collective will is hard work."

"Make heroes out of these genius makers who bring out the best in others."



GOOD TO GREAT

Why Some Companies Make the Leap ...and Others Don't

BY JIM COLLINS

THE BIG "SO WHAT"

The book addresses the questions: Can a "good" company make the transition to be "great"? And if so, how? Through extensive research and analysis, Collins identified a number of timeless principles that helped a small group of companies to break away from the rest and consistently outperform the market.

IDENTIFYING GREATNESS

Collin and his research team started with 1,435 good companies, examined their performance over 40 years, and identified 11 companies that became great, namely Abbott, Circuit City, Fannie Mae, Gillette, Kimberly-Clark, Kroger, Nucor, Philip Morris, Pitney Bowes, Walgreens, Wells Fargo. These good-to-great companies had:

- 15 years of cumulative stock returns at/ below the general stock market
- A distinct transition point
- Followed by cumulative stock returns of at least 3 times that of the general market overthe next 15 years

This group of 11 companies were compared against 2 groups of comparison companies, the first group from same industry (with similar circumstances but didn't make the leap), and the second group of "unsustained companies" that made the leap but didn't sustain the performance.

Why bother with greatness to begin with? The findings suggest that it does not take a lot more to build a great organization as it does a good one, yet the process is more fun and delivers better

KEY QUOTES

"(The book) is ultimately about one thing: the timeless principles of good to great."

"Good is the enemy of great is not a business problem. It is a human problem."

"Greatness is not a function of circumstance. Greatness, it turns out, is largely a matter of conscious choice."

results, so why not? In any case, when the company focuses on what its people are passionate and about (a trait of good-to-great companies), people will naturally want to make it great.

LEVEL 5 LEADERSHIP

At the time of their big transition, all the good-to-great companies had Level 5 leadership. "Level 5 leaders" are at the top of a 5-level hierarchy, & exhibit the duality of personal humility and professional will, e.g. Colman Mockler, David Maxell, Darwin Smith, Joe Cullman, Fred Allen.

Professional Will

Level 5 leaders have huge ambitions for their institutions (not themselves). They are fanatically-driven to deliver results, set exacting standards, demonstrate an unwavering resolve and a quiet doggedness to do whatever it takes to bring the company to greatness.

They demonstrate the window-and-mirror syndrome. When things go well, they look out of the window and give credit to factors outside of themselves (when they can't find factors to credit, they attribute success to "good luck"). When things go poorly, they look in the mirror, take responsibility internally and never blame bad luck.

Noticeably, the good-to-great companies did not have celebrity leaders from the outside. Rather, 10 of the 11 CEOs companies had CEOs from the inside, unlike the comparison companies that tried outside CEOs 6 times more often.

KEY QUOTES

"Self-effacing, quiet, reserved, even shy – these leaders are a paradoxical blend of personal humility and professional will. They are more like Lincoln and Socrates than Patton or Caesar."

"Level 5 leaders are fanatically driven, infected with an incurable need to produce results"

"We were not looking for Level 5 leadership in our research, or anything like it, but the data was overwhelming and convincing. It is an empirical, not an ideological, finding."

Personal Humility

Level 5 leaders put their egos aside, and focus on the companies' long term interests. They demonstrate a "compelling modesty", talk about the company (not themselves), shun public praise, and are not boastful. They rely on inspired standards, not charisma, to motivate. They set up successors so that the company could be great without them.

By contrast, the unsustained comparison companies were more likely to have talented but ego-centric leaders, who produce a leap in performance, that dies off over time

Identifying Potential Level 5 Leaders

While there's no solid research on how to cultivate Level 5 leaders, Collins recommends looking for situations where there are extraordinary results but no one is stepping forth to claim excess credit – there's a high chance you will find a Level 5 leader at work.

FIRST WHO...THEN WHAT

Instead of setting a grand vision and strategy, then rallying people behind them, good-to-great companies got the right people onboard, then figured out which direction to take.

Right people, then direction/strategy

The Level 5 leaders first focus on finding the right people (A-team players who make a conscious decision to take on the challenges), then developed the strategy. For example, David Maxwell, CEO of Fannie Mae held back on his strategy until his team was in place, despite pressure from the board, and even though the company was $56 billion in debt and losing $1 million each business day.

By contrast, the comparison companies focus first on setting the vision, then putting people on the roadmap. Their leaders may be individually talented, but tend to enlist helpers rather

KEY QUOTES

"They first get the right people on the bus, the wrong people off the bus, and the right people in the right seats – and then they figured out where to drive it."

"Great vision without great people is irrelevant."

"In a good-to-great transformation, people are not your most important asset. The right people are."

than develop strong executives - the model falls apart when the leader leaves.

There was no evidence to support the idea that a certain structure of executive compensation (be it cash, stock, salaries or incentives) help in the good-to-great transition. The right compensation helps to get the right people onboard & keep them there. However, once you have the right executives, their behaviours aren't dependent on the compensation model; their own drive for excellence will ensure that they do the best they can.

Be Rigorous (but not Ruthless) about People

Good-to-great companies exercise rigorousness in people-related decisions and in building a superior executive team. However, they do not carry out endless restructuring nor ruthlessly swing the axe. Layoffs were used 5x more frequently in comparison companies than good-to-great companies. Collins identified 3 practical principles for rigorousness:

When in doubt, don't hire – keep looking. Grow at a pace with which your company can attract enough of the right people.

If you need to make people changes, do it. Obviously, it is best to have the right person in the right seat to begin with. At the top management level, good-to-great companies show a bipolar pattern: people either stay for a long time, or they leave quickly (if there's no fit). To assess if someone should be on the team, ask:

- Would you hire this person again?
- If the person were to leave, would you be disappointed or relieved?

Put your best people on your biggest opportunities, not your biggest problems. But, if you sell off your problems, don't sell off your best people.

The 3 simple truths

The "First Who, then What" approach works because of 3

KEY QUOTES

"It's not how you compensate your executives, it's which executives you have to compensate in the first place."

"The right people will do the right things and deliver the best results they're capable of, regardless of the incentive system."

simple truths:

- Beginning with "who" rather than "what" means that people are not onboard because of a specific direction – that makes it easier to adapt to external changes and switch direction if necessary
- The right people are already intrinsically motivated to produce the best possible results and be part of something great – there are no issues of people management and motivation to deal with.
- If you have the wrong people, you cannot succeed even if you had the best direction.

CONFRONT THE BRUTAL FACTS (YET NEVER LOSE FAITH)

Good-to-great companies don't just pursue a vision – they constantly refine their paths with brutal facts, with 2 types of disciplined thought:

- They face the brutal facts in all their decisions; and
- They apply a simple but insightful frame of reference (the Hedgehog Concept) for all their decisions.

Confronting Brutal Facts…

Good-to-great leaders create an environment where the truth can be heard. By contrast, larger-than-life/ charismatic leaders can become a liability if the focus is on them rather than the true realities. There are 4 basic practices to achieve a climate of truth:

Lead with questions, not answers. Those leading from good-to-great realize that they do not have all the answers. They ask the right questions that lead to the best possible insights. They use informal meetings (without agenda) to allow realities to surface.

Engage in dialogue & debate, not coercion. Good-to-great companies have intense dialogues, and their strong executives debate and fight aggressively to find the best answers. Yet, because of this process, they will unify fully behind a decision.

KEY QUOTES

"The moment a leader allows himself to become the primary reality, rather than the reality being the primary reality, you have a recipe for mediocrity, or worse."

"Yes, leadership is about vision. But leadership is equally about creating a climate where the truth is heard and the brutal facts confronted."

Conduct autopsies, without blame. This supports understanding and learning, and creates a climate where the truth is heard.

Build "red flag" mechanisms. Good-to-great companies did not have more information than comparison companies, but they paid attention to crucial information. The red flag concept means turning information into feedback that cannot be ignored.

...with Unwavering Faith

There is a sense of euphoria in good-to-great companies as they demonstrate a commitment to prevail, face the truths head on, and emerge stronger and more resilient.

They all demonstrate the "Stockdale Paradox" – they retain the faith that they will prevail in the end, and at the same time exhibit discipline to confront the most brutal facts of their current realities. They are not simply optimists who believe that things will work out on their own.

THE HEDGEHOG CONCEPT

This idea is built on the concept of the Greek Parable, The Hedgehog and the Fox. The fox pursues many ends, sees the world as complex, and is scattered/ diffused. The hedgehog, conversely, simplifies the world into a single idea or principle that guides everything it does.

Good-to-great companies demonstrate a strategic difference in 2 areas:

- They build their strategies on a deep understanding of the "three circles";
- They identify a simple, crystalline concept that guides all their efforts

KEY QUOTES

"They all maintained unwavering faith that they would not just survive, but prevail as a great company. And yet, at the same time, they became relentlessly disciplined at confronting the most brutal facts of their current reality."

"Yes, leadership is about vision. But leadership is equally about creating a climate where the truth is heard and the brutal facts confronted"

Simplicity within the Three Circles

The Hedgehog Concept lies at the intersection of the 3 circles:

What you can be the best in the world at. A hedgehog concept is not a goal / strategy/ intention/ plan to be the best; it is an understanding of what you can be the best at. It is equally important to know what you cannot be best in the world at. It requires transcending the "curse of competence" - just because something is your core business doesn't mean you can be the best at it.

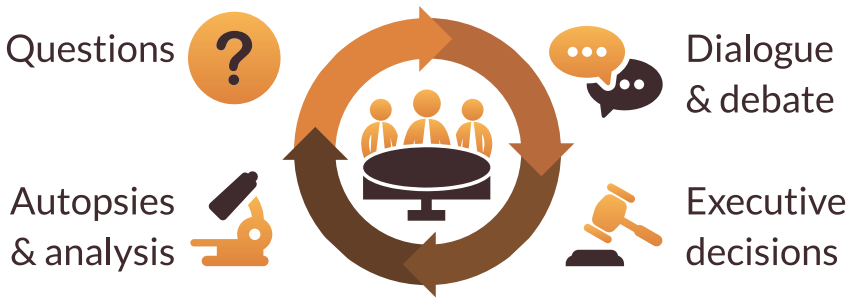
What drives your economic engine. Good-to-great companies discover the one denominator (profit per "X") that impacts their economics most significantly, where "X" could be employee, geographic region, customer, consumer brand etc.

What are you deeply passionate about. It is not about stimulating passion, but discovering what makes you passionate, be it for the product, industry, or what the company stands for.

An Iterative Process

Getting clarity on the Hedgehog Concept is an iterative process and takes time. The good-to-great companies took about 4 years on average to crystalize their concepts. Yet, when they find it, it has a quiet, obvious truth to it that is undeniable.

The process involves repeating these 4 steps (guided by the 3 circles). A useful device to use is the "Council" (a standing body of 5-12 right people) who meet periodically to debate and perform the 4 iterative steps:



A CULTURE OF DISCIPLINE

Most successful start-ups don't grow into great companies. As

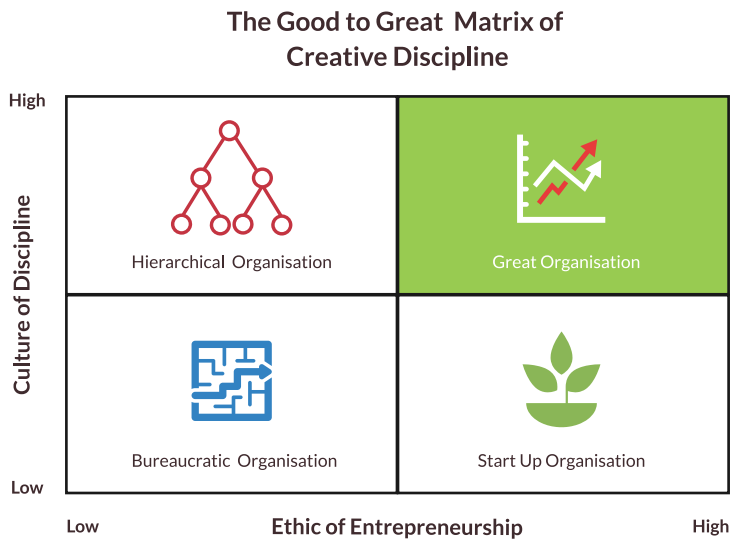
KEY QUOTES

"You can't manufacture passion or 'motivate' people to feel passionate. You can only discover what ignites your passion and the passions of those around you."

"While it has a crystalline clarity and elegant simplicity once you have it, getting the (hedgehog) concept can be devilishly difficult and takes time."

"When you get your Hedgehog Concept right, it has the quiet ping of truth…There is no need to say much of anything.; the quiet truth speaks for itself."

they grow, they start to introduce bureaucracy and rules to make up for incompetence and lack of discipline.



To avoid bureaucracy, hierarchy, and excessive controls, instil a culture of discipline (through disciplined people, thought and action). Combine the culture of discipline with an ethic of entrepreneurship to get superior performance.

Specifically , this involves a few components:

Build a culture around freedom and responsibility, within a specific framework or system with clear parameters.

Hire only self-disciplined people, who will go the extra mile to fulfil their responsibilities. That way, you only need to manage the systems but not the people.

Build a culture of discipline, not use a tyrannical disciplinarian. Good-to-great companies have Level 5 leaders who develop an enduring culture of discipline, while un-sustained comparisons had leaders who personally and forcefully discipline the organization.

Fanatical adherence to the Hedgehog Concept. Only start or do things that fall into the intersection of the 3 circles. Stop doing anything, however big the opportunity, that falls outside the intersection. Create a "stop doing" list, so you can channel all

KEY QUOTES

"When you combine a culture of discipline with an ethic of entrepreneurship, you get the magic alchemy of great performance."

"A great company is more likely to die of indigestion from too much opportunity than starvation from too little. The challenge becomes not opportunity creation, but opportunity selection."

your resources into the 1-2 areas that you choose to focus on (which is consistent with your Hedgehog Concept).

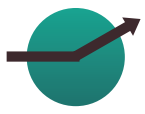
TECHNOLOGY ACCELERATORS

Good-to-great companies think differently about technology.

Technology as accelerators, not creators, of momentum. 80% of good-to-great executives do not consider technology as one of the top 5 factors in their transformation. Technology cannot ignite transformations; they can only accelerate momentum. Good-to-great companies carefully select the technology they adopt - if a technology fits directly with their Hedgehog Concept, they adopt it fully and become pioneers in the application of that technology.

Avoiding the Technology Trap. Good-to-great companies do not focus on technology as a key factor in their transitions. They do not respond to technology fads nor jump on the bandwagon. Rather, they focus single-mindedly on their Hedgehog Concept and use technology as merely one of the tools or drivers to accelerate results.

Unlike comparison companies, many of whom adopted technology with the fear of being left behind, the good-to-great companies are motivated by their inner drive for excellence and their deep creative urge. They maintained a balanced and big-picture view on technology .



THE FLYWHEEL AND THE DOOM LOOP

The good to great transition is not a process of overnight metamorphosis, nor is there a single big success factor. It is an accumulation of many interlocking steps and factors that build on one another until a point of breakthrough

KEY QUOTES

"Technology is by itself never a primary, root cause of either greatness or decline."

" 'Crawl, walk, run' can be a very effective approach, even during times of rapid and radical technological change."

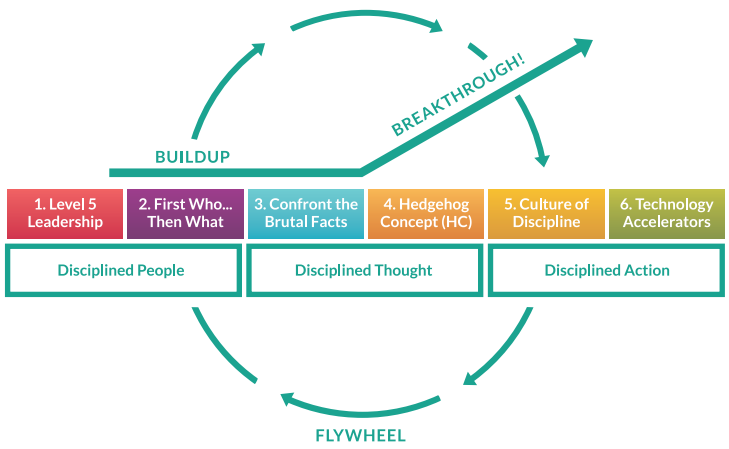
"Good to great comes about by a cumulative process – step by step, action by action, decision by decision, turn by turn of the flywheel – that adds up to sustained and spectacular results"

is reached, much like how a flywheel picks up momentum turn by turn. The companies usually did not realize their own transformation until after the fact.

A surprising finding was that, good-to-great companies did not have to deal with issues of commitment, alignment, motivation etc. – with the right conditions, these problems simply dissolved.

The companies don't usually start with a publicly proclaimed goal. They start by spinning the flywheel, turn by turn, creating an understanding of their action and results. When people can see the results and potential, and how a plan is being born, they naturally rally behind it. Because the flywheel is doing the talking, there is no need to fervently communicate the goal or align people to the vision.

The reverse holds through for comparison companies, who suffer the "Doom Loop" – A new direction/ program/ leader/ event kicks in, there is no build-up of momentum, creating disappointing results, and people react without understanding.



Essentially, the flywheel is a wraparound idea: every component in the book provides a push on the flywheel, and all the pieces work consistently and coherently together to create momentum and an eventual breakthrough.

FROM GOOD TO GREAT TO BUILT TO LAST

Generally, *Good to Great* is much like a prequel to the book

KEY QUOTES

"Under the right conditions, the problems of commitment, alignment, motivation and change largely melt away."

"The process resembled relentlessly pushing a giant heavy flywheel in one direction, turn upon turn, building momentum until a point of breakthrough, and beyond."

"This book is about how to turn a good organization into one that produces sustained great results. Built to Last is about how you take a companies with great results and turn it into an enduring great company of iconic stature."

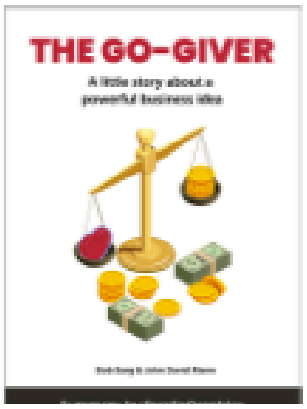
Built to Last. The good-to-great ideas lay the groundwork to bring a company from startup to sustained great results, while built-to-last ideas take it beyond to become an enduring company with an iconic stature.

The key difference is that, with the flywheel already having gathered momentum, Visionary Companies emerge when they can develop core values and a purpose beyond profits, and can constantly preserve their core while stimulating progress. Connecting the ideas in the 2 books, Collins highlighted that a good BHAG should be set with understanding of the 3 circles - it provides a powerful unifying force to help people focus on bringing the Hedgehog Concept further and deeper .

OTHER DETAILS TO LOOK OUT FOR IN THE BOOK

For those who are into research methodology and details, Collins provides an outline of the research journey in Chapter 1 of the book, with research appendixes detailing the companies selection process, & breakdown of several analysis of CEOs, industries, acquisition strategies etc.

He also lists down the best practices for the 11 good-to-great companies including their "Best-in-the-world" list (pages 101-103), their economic denominators (pages 106-107), and their list of technology accelerators (pages 150-151). He ends off the book with a detailed list of conceptual links between *Good to Great* and *Built to Last* (pages 198-201), and some Q&As on common questions and clarifications asked about the Good to Great ideas.



THE GO-GIVER

A Little Story About
A Powerful Business Idea

BOB BURG AND JOHN DAVID MANN

The Big "So What"

In a brutally competitive world where everyone seems to be fighting to earn more and achieve greater success, this book offers an alternative set of business success principles built on giving and adding value to others. These laws were originally written to help businesses to increase sales and profits, but were found to also improve relationships and success in life.

The Story

The Go-Giver is a fable about an ambitious young man, Joe, who propelled himself to phenomenal success after he learned and applied the "Five Laws of Stratospheric Success".

Joe was a true go-getter—diligent, efficient, and dedicated—yet frustrated that he could not achieve his goals despite his hard work. One day, desperate to close a major sale to meet his quarterly targets, he sought the advice from a famous consultant, Pindar.

He was surprised to discover that Pindar's secret to making money and growing his business was to give sincerely. Pindar offered to mentor Joe, on the condition that Joe would personally test and apply every one of the lessons he was taught.

Over a week, Pindar introduced Joe to several "go-givers", including a restaurateur, a CEO, a financial adviser, and a real estate broker, who jointly shared the details of the 5 laws. By the end of the week, Joe had learned the power of giving, and understood that by putting others' interests first and continually adding value to their lives, you could eventually generate unexpected returns.

KEY QUOTES

"While the world may at times appear to be a dogeat-dog place, there is actually a set of much kinder and vastly more powerful principles operating beneath the surface of casual appearances."

"To get really, really big, to reach the kind of stratospheric success we're talking about, people need to have something on the inside, something that's genuine."
- Pindar from The Go-Giver

The 5 Laws of Stratospheric Success

Most people are hesitant to give because they are afraid of being taken advantage of. However, people tend to treat you the way you expect to be treated, so it becomes a self-fulfilling prophecy.

Giving first is like adding logs before expecting the fire to burn, or putting in your capital before expecting to get interest. You need to give first to receive later.

1. The Law of Value

Your real worth is defined by how much more value you give than how much you get paid.

Before thinking about profits, first ask yourself, does this serve others? When you focus on giving value as a way of life, the money will naturally follow.

In the story, Pindar introduced Joe to restaurateur, Ernesto Iafrate, who started with one hot dog stand and grew his empire to include multiple restaurants with several hundred millions worth of real estate. Ernesto shared the secret behind his phenomenal success, which was to deliver incredible value to his customers. He explained that:

A **bad business** aims to give the *bare minimum* quantity and quality of goods and services to customers, to justify the money it's being paid.

A **good business** aims to give *the most possible* quantity and quality of goods and services, for the money received from customers.

A **great business** aims to deliver *unbelievable value*, offering such high quantity and quality of goods and services that it's almost unreal.

KEY QUOTES

"Ultimately, the world treats you more or less the way you expect to be treated."
- Pindar from The Go-Giver

"Appearances can be deceiving... they nearly always are."
- Ernesto from The Go-Giver

"If you need money, add value. And if you need a lot of money, add a lot of value."
- Pindar from The Go-Giver

After going back to his office, Joe tried to find ways to apply the lesson. The next day, he received a call from a client who has decided not to renew his contract as his company needed a firm with stronger overseas connections. Although Joe was upset, he put the Law of Value to use by recommending a competitor who could meet the client's needs.

2. The Law of Compensation

Your income is decided by the number of people you serve and how well you serve them.

The first law defines how valuable you are, and thus your *potential* to make money. This second law decides how much impact you make, and therefore how much money you actually earn.

In the story, Joe was next introduced to Nicole Martin, the young, dynamic and creative CEO of a company that marketed learning programs to schools globally. Nicole was formerly a grade school teacher who was frustrated with the limited impact she was making. When she developed a learning system for children, she was able to extend her reach beyond her classroom. As she scaled her system and related products, she reached thousands of children, and eventually adapted the system for corporate executive training as well. As the reach and impact of her business grew, so did her profits.

This law is fully within your control:

- You can decide **how many people you want to serve** and how big an impact you want to make.
- You can even change your **limiting beliefs**, e.g. doubts about your ability to create a big impact and achieve huge success. You're the only person who can hold yourself back.

When Joe returned to his office, he tried to apply this rule by personally serving coffee to each of his colleagues, all of whom were pleasantly surprised by this gesture.

KEY QUOTES

"Your compensation is directly proportional to how many lives you touch."
- Nicole from The Go-Giver

"Money is not a measure of your goodness or worthiness; it is a measure of your impact."

3. The Law of Influence

Your influence is defined by how often and how much you focus on others' interests first.

This law is about giving freely, rather than keeping score of when or how you help people.

The idea of "win-win", or having a fair 50-50 split in benefits for both sides, only works in theory. In reality, the best way to build strong relationships is to **focus 100% on helping the other person**, without keeping track of how much others owe you or how much they gain.

Most people wrongly believe that you gain influence through wealth, status and success. In reality, the reverse is true—**influence brings wealth, status and success**, and the most influential people are those who give and add value to others.

When we help someone, it's common for us to think or say, "you owe me one". If you can help someone **without strings attached**, you become truly attractive as a person, and this naturally increases your influence.

In the story, Joe next met Sam Rosen, Nicole's financial advisor. Sam started out as a struggling insurance salesman, but gradually built a good reputation and began to attract bigger cases. He eventually became a top salesman and offered a broad range of financial advisory services, before starting to work with non-profit organizations and became one of the top philanthropists in his state.

Sam explained that his success came not just from giving great value, but also on **developing a huge network**. Sam defines a network as "people who are personally invested in seeing you succeed". They may not be your customers and may never even buy something from you. However, they like you and want you to succeed.

When you have a huge network, you essentially have an army of **personal ambassadors**.

KEY QUOTES

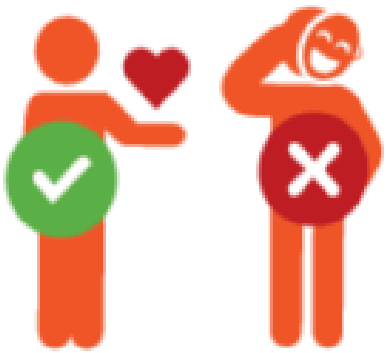
"Forget win-win—focus on the other person's win."
- Sam from The Go-Giver

That night, Joe returned home to find his wife, Susan, feeling troubled about work. Typically, their norm was to each take no more than 30 minutes to share about their day. Joe decided to listen fully to Susan, giving her his full attention without keeping track of the time or their usual "rule".

To his surprise, Susan was so touched by the gesture that she left him a note the next morning to thank him for making her feel more loved and heard than she had in a long time. Joe started to realize that the laws also apply outside of business, to one's relationships and personal life.

4. *The Law of Authenticity*

The biggest and most valuable gift you can offer is yourself.



Every human being craves genuine connections and relationships. Hence, the best gift you can offer someone is your authenticity, simply by being yourself rather than pretending to be someone else. No amount of manipulation skills or techniques can be as effective or valuable as your authenticity and sincerity.

To learn about Law 4, Pindar brought Joe to a symposium by Debra Davenport, the city's top realtor in residential and commercial markets.

During the symposium, Debra shared how she suffered from low self-esteem after her husband left her. She was unable to get a job, and failed to make progress in real estate despite learning all sorts of **sales and closing techniques**.

Ironically, she made her first breakthrough when she wasn't trying to close a sale. That was when she realized that the biggest value she could offer was to **be authentic** and sincerely connect with people around her. Achieving success involves 90% people skills and only 10% technical skills.

While Joe found the laws and lessons to be intriguing, he was no closer to meeting his quarterly targets and wondered if he was wasting his time. Back in his office, he bumped into Gus, the

KEY QUOTES

"No matter what your training, no matter what your skills, no matter what area you're in, you are your most important commodity. The most valuable gift you have to offer is you."
- Debra from The Go-Giver

"You want people skills? Then be a person... It's called authenticity."
- Debra from The Go-Giver

top performer in his company, and the two men had a brief chat. Joe shared openly about his encounters with Pindar and the go-givers, as well as his worries about his quarterly targets.

He was surprised to realize that Gus was the very person who had connected several of the go-givers many years ago, and that Gus had been applying the 5 laws to achieve his massive success.

5. The Law of Receptivity

To give effectively, you must be open to receive.

Most of us have been taught that it's better to give than to receive. However giving and receiving are 2 sides of the same coin. There can be no act of giving without a concurrent act of receiving, just like how you cannot exhale without inhaling.

This law is often the hardest for most people, as we've been conditioned to see altruism and self-interest to be mutually exclusive. However, when you're not open to receiving (e.g. if you feel bad about receiving a favor or rejects someone's help), you are actually stopping **the flow of giving and receiving**.

The next time someone pays you a compliment, simply receive it graciously by saying "thank you" with a smile. This could be your first step to **applying this law**.

After learning all 5 laws, Joe found himself feeling less anxious about his quarterly targets, even though he had made no real progress since he first approached Pindar. That Friday evening, as he was reflecting on his situation in the office, he received a call from the competitor he had referred his client to. It turned out that there was an once-in-a-lifetime business opportunity that his competitor couldn't fulfill, and he was contacting Joe for assistance.

What goes around comes around. That was how Joe became a partner in a coffee business and went on to achieve stratospherical success.

KEY QUOTES

"Every giving can happen only because it is also a receiving."
- Pindar from The Go-Giver

"If you don't let yourself receive, you're refusing the gifts of others–and you shut down the flow."
- Pindar from The Go-Giver

Other Lessons from the Story

Besides the 5 laws, Joe also learned several things by observing the go-givers.

As he met each business-owner, he was struck by how gracious, friendly and polite each of them were in spite of their successes, and how they all exhibited an intense, magnetic quality. Later on, he realized that it was the **Law of Influence** at work—by giving unselfishly, they became more attractive as individuals.

He also learned about the **powerful life philosophy** adopted by Rachael, the lady who eventually partnered with Joe to grow a huge coffee enterprise.

- *Survive-save-serve*. Rachael was always full of zest for what she did, even if she didn't always enjoy the task. This was because she was always grateful for the chance to *survive* (i.e. meet her basic living needs), *save* (i.e. have excess resources to expand her life beyond basic needs), and *serve* (i.e. contribute to others around her).

- Most people focus on surviving, and some on saving. However, the rare ones those who *focus on serving* often find themselves becoming so successful that the first 2 components naturally fall in place.

Applying the Go-Giver Approach

At the heart of this book is the old maxim, "Give and you shall receive." The principles may not sound logical, but the only way to test if they work is to apply them, just like what Joe did. In applying the 5 Laws of Stratospheric Success, here are some useful points to note:

Effort. The go-giver approach is not a magic solution. You still need to put in the effort for your business to work. However, by shifting your perspective and focus, you can achieve greater success and fulfillment.

KEY QUOTES

"Success is the result of specific habits of action: creating value, touching people's lives, putting others' interests first, being real, and having the humility to stay open to receiving."

Patience. The 5 laws may create greater and faster results in the long run, but the results will not be instantaneous. Be patient and give time for the results to kick in.

Profits and achievements. There's nothing wrong with making profits or being a go-getter. The key is to focus not only on profits or on achieving your personal goals. When you focus on giving value to others, you tend to get better results and profits in the long run.

Value is not just about cash or money. You can offer as much (if not more) value to others by giving your friendship, attention, energy etc. This means that anyone—regardless of your business size or financial situation—can be a go-giver.

Giving is not about charity or sacrificing yourself. It's merely about putting aside your self-interest temporarily to focus on others.

By applying these ideas, you can improve not only your business sales and profits, but also the outcomes in your **personal life**.

Other Details in the Book to Look Out For

After the original book was published, it grew into a movement. Readers started to share how they used the 5 laws to turn around their businesses with more sales and happier customers, improve their marriages and parenting.

This expanded edition of the book was published nearly a decade later, and includes an additional foreword by Arianna Huffington, a new introduction, a discussion guide, and a set of Q&As. For more details, please visit http://thegogiver.com/.

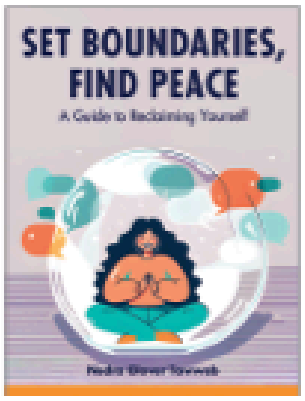
KEY QUOTES

"The Five Laws aren't magic; genuine success still takes work, but it becomes work you love."

"There's nothing wrong with making money... It's just not a goal that will make you successful."
- Pindar from The Go-Giver

"A genuinely sound business principle will apply anywhere in life—in your friendships, in your marriage, anywhere."

The Go-Giver started as a book but soon became a movement."



SET BOUNDARIES, FIND PEACE

A Guide to Reclaiming Yourself

Nedra Glover Tawwab

The Big "So What"

In this book, licensed therapist Nedra Tawwab explains what boundaries are, and how you can establish healthy boundaries to enhance your relationships and well-being. These insights are valuable for anyone seeking to enhance their mental-emotional wellness, or to overcome codependency, power struggles, anxiety, depression, or burnout.

Introduction

Boundaries define roles, expectations, and acceptable behaviors in relationships. They ensure that your needs and expectations are met, and you feel secure and comfortable in your relationships.

- As a therapist, Tawwab finds that one of the most common problems in relationships and mental health issues is the *lack of clear boundaries*. Often, we don't set boundaries for fear of upsetting others. Yet, the lack of boundaries leads to draining, one-sided, or even abusive relationships. These create mental, emotional, and physical pain, exhaustion, or burnout.

- It's better to *face the short-term discomfort* of setting boundaries, than to pay the long-term price of unhealthy and dysfunctional relationships.

In this book, Tawwab discusses many overlapping ideas about boundaries over 15 chapters. We've distilled and organized the key ideas into **2 parts** in this summary:

- Understanding Boundaries: What they are and why they matter.

- Implementing Boundaries: How to set and maintain healthy boundaries.

KEY QUOTES

"This book will...give you the confidence and courage to create healthy boundaries in your own life."

"People don't know what you want. It's your job to make it clear. Clarity saves relationships."

"Set a boundary or suffer the consequences of not setting one."

"Boundaries will set you free."

"Boundaries are the gateway to healthy relationships."

Understanding Boundaries

Types of boundaries and where they come from

Broadly, there are **3 types of boundaries**:

- *Porous boundaries* are vague or ill-defined. You often say "yes" when you want to say "no," leading to overexertion, anxiety, and unhealthy relationships. Common signs include: emotional entanglement, fear of rejection or disapproval, oversharing, people-pleasing, over-reliance on external validation, and even tolerating abuse.

- *Rigid boundaries* are strict rules intended for self-protection. However, you may end up shutting people out, disregarding others' needs and feelings, and isolating yourself. Signs include: distancing yourself, having unreasonable expectations, refusing to share or compromise even when it's necessary.

- *Healthy boundaries* are based on self-awareness, not emotional baggage. You know your physical, mental and emotional capacity, and can communicate your needs and expectations clearly to balance intimacy and a healthy sense of self. Signs include: clarity of values, appropriate sharing, willingness to be vulnerable with those you trust, and the ability to say and accept "no."

You cannot build a healthy relationship with rigid or porous boundaries. Here are several **signs that you need clear boundaries.**

- *Self-neglect*: You prioritize others' needs over your own, to the point your physical, mental, and emotional well-being suffers.

- You feel perpetually *overwhelmed* and often wish to escape it all. Yet, you keep trying to add more to your endless to-do list.

- You feel angry, frustrated and *resentful of others' requests* because you feel underappreciated and exploited. Your anger might be directed inwardly (e.g. self-blame) or outwardly (e.g. tantrums or apathy) to hurt your relationships and mental health.

KEY QUOTES

"Boundaries are not walls. A wall keeps people out, while boundaries show people how to exist in a relationship with you."

"If you learn to pay attention to your body, it will tell you when it's time to set boundaries."

- You *avoid* certain people so they can't load you with new requests, e.g. you avoid picking up their calls or postpone/ cancel your meetings in hopes that person/problems will just go away.

- You experience *mental health issues* like severe anxiety or symptoms of burnout.

Why We Fail to Set Boundaries

There are several **obstacles to boundary-setting**:

- *Thinking that the problem lies with others* and waiting for them to change. In reality, you have the power to change your relationship dynamics.

- *Giving up prematurely* after failed attempts to set boundaries in the past.

- *Lack of self-awareness*: You don't realize that your feelings of resentment, frustration, or exhaustion are signs that you need clearer boundaries.

- *Imagining the worst*, then holding back because you're afraid of failure, rejection, confrontation, discomfort, appearing mean/ rude, or causing awkwardness.

Our **perceptions and approach** to boundaries are influenced by many factors, including our personality, families, teachers, peers, and mass media.

- Our first lessons on boundaries come from our *families*, especially the rules and limits set by our parents. If your family members often dismissed or disrespected boundaries, then you might find it harder to assert your own boundaries.

- *Childhood issues* can greatly impact our ability to set boundaries. These include physical/emotional abuse or neglect, and traumatic experiences like domestic violence, bullying or abandonment. Trauma often leads to unhealthy attachments, where the person becomes either emotionally-aloof, or overly-reliant on others. Unresolved boundary breaches can create a damaging cycle of self-doubt and self-neglect.

KEY QUOTES

"Avoidance is a passive-aggressive way of expressing that you are tired of showing up."

"Assuming the worst is what most often stops us from even trying."

- People who are *prone to anxiety* often find it harder to manage their emotions and to honor others' boundaries. By contrast, people who are self-aware and adaptable are more likely to maintain and respect boundaries effectively.

Implementing Boundaries

There are **2 key parts** involved in setting and maintaining boundaries:

- You must explicitly *communicate* your needs and expectations, rather than expect people to guess what you're thinking or feeling. For example, you can say, "It's important to me that you honor our plans. If you need to make changes, please call or message me a few hours in advance."
- Then, you must uphold your boundaries consistently with *action*. In the example above, if your friend tries to change plans at the last minute, decline and reschedule it 1 week later.

Communicating Your Boundaries

You can't resolve boundary issues by complaining, gossiping, avoiding, creating physical distance, or hoping for problems to disappear on their own. Avoid **4 common but ineffective ways** to express boundaries:

- *Passiveness*: Ignoring your own needs and allowing others to do as they please.
- *Aggression*: Asserting your needs harshly, e.g. raising your voice, name-calling, or belittling others.
- *Passive-Aggression*: Acting out your unexpressed feelings, e.g. giving someone the cold shoulder even though you claim you're not upset.
- *Manipulation*: Forcing others to do what you want by withholding affection or inciting guilt/confusion.

The best way to convey your needs is to **be assertive**. State your needs respectfully, clearly, and precisely, keeping your tone calm

KEY QUOTES

"Assume that people know only what you tell them, honor only what you request, and can't read your mind."

"The truth is that unhealthy boundaries will follow you wherever you go unless you learn to verbalize them."

"People do not have to like, agree with, or understand your boundaries to respect them."

and your language simple. Use statements that begin with "I need," "I want," "I expect," or "I would like." Don't offer any reasons for the boundary nor apologize for it.

After sharing the boundary, immediately **address any discomfort** you may feel, such as sadness, remorse, or guilt. Face the feelings rather than deny or dismiss them.

- To alleviate the feelings, engage in *self-care activities* like meditation, journaling, or walking.
- *Reframe boundaries* as positive tools to empower yourself and build healthier relationships.

Be prepared for **resistance from others**. Let's imagine that you've just asked your colleague John to keep his side of the shared workspace tidier. John might:

- *Push back*: "What's the big deal? You have your side and I have mine." In this situation, reassert your boundary respectfully: "I understand it's inconvenient for you, but I really need a clean workspace to focus."
- *Test your limits*: John might clean up slightly, then let the clutter build up again. Stand firm, express your feelings, and restate your boundary, e.g. "I feel unsettled when my boundaries are tested. I'd like to reaffirm my request for a clean workspace."
- *Ignore* your request: In this case, restate your boundary, invite him to repeat what you said to confirm his understanding, and point out if he ignores your boundary again.
- *Challenge* or question your reasons: Don't try to explain yourself, as it could lead to a lengthy debate. Keep any response short and clear.
- *Defend*: If John gets defensive or tries to shift the blame, address one issue at a time using "I" statements to express your needs and feelings. For example, "When the workspace is cluttered, I feel stressed and unfocused."
- Start *ghosting* you: If John starts to avoid you or stops responding to your calls/messages, send a note to express your observations, feelings, and concerns, e.g. "I noticed that you seem upset since our conversation. Can we discuss this?"

KEY QUOTES

- Use the *silent treatment*: John becomes visibly cold and distant. In this case, respond in the same way for ghosting.

- *Accept* your boundary: This is the ideal and healthiest response, where John acknowledges your boundary and agrees to keep his workspace tidy.

Upholding and Maintaining Your Boundaries

Consistency is key. Uphold your boundaries without apology or compromise. Over time, both parties will adapt.

- *If a boundary is violated*, speak up immediately and restate your boundary. You can also express your feelings, re-emphasize your expectations, and ask them to paraphrase your request to ensure they've understood it.

- If someone *repeatedly violates your boundaries*, you can:

  (i) Limit interaction: minimize contact, keep conversations brief, and listen without offering advice.

  (ii) Issue an ultimatum, e.g. "If you show up unannounced again, I won't open the door."

  (iii) Terminate the relationship if necessary. Only do this as a last resort after you've communicated your concerns, established your boundaries, and considered the relationship's positive aspects.

- In the event of *conflicting boundaries*, decide whether to compromise, maintain separate boundaries, or accept one side's boundaries.

Existing **mental health issues** can amplify boundary problems, and vice versa. Use these additional tips to cope:

- *Anxiety* usually comes from an inability to stand up for yourself, worrying excessively, setting unrealistic goals, and/or constantly comparing yourself with others.

  - Before making a commitment, ask yourself: Do you have the time/resources to undertake this? Whose expectations are you trying to meet? What's the worst outcome if you don't meet them? How can you uphold your boundaries?

KEY QUOTES

"Ending a relationship isn't a sign that you no longer care about the other person. It's an indicator of self-love, self-care, healthy boundaries, bravery, and your desire to be well."

"We can't create more time, but we can do less, delegate, or ask for help."

- Use positive affirmations such as: "I have the right to set expectations," or "In a healthy relationship, my needs are acknowledged and respected."

- *Depression* is often linked with feelings of hopelessness. Use small wins to instill hope.

  - Start with simple boundaries, e.g. correct a stranger who mispronounces your name, or request a redo if the restaurant gets your order wrong.

  - Use positive affirmations, such as: "I can honor small promises to myself" or "I can use small wins to achieve bigger ones."

Identifying and Managing Boundary Violations

Boundary violations can be **big or small**.

- *Micro boundary violations* seem trivial, but they accumulate over time to have a big impact. They include:

(i) *Microaggressions*: subtly-offensive responses about your behaviors or identity (e.g. gender, race). For example, someone may laugh at your accent or make remarks like: "I didn't know you were gay. You don't act like one." You can point out the violation, e.g. "What does it mean when you say I don't act like I'm gay?" Or, suggest a more respectful approach.

(ii) *Oversharing*: when someone shares too much personal information, e.g. a colleague sharing about her marital problems during a project discussion. You can redirect the discussion, or diplomatically request for a change of subject (e.g. "I'm uncomfortable with this discussion. Can we shift to another topic?")

(iii) *Guilt-tripping*: when someone uses guilt to manipulate you into doing what they want. For example, you decline to go for drinks after work and your colleague says, "Our company isn't good enough for you?" You can call them out on the manipulative comments or restate your choices without providing justifications.

KEY QUOTES

"Healthy relationships are not one-sided. The needs of both individuals are equally important."

- *Macro boundary violations* are persistent and can inflict long-term damage to relationships. They include:

  (i) *Enmeshment*: where parties in a relationship have no personal space or sense of self. To counter this, re-establish physical space and individual identities, and take responsibility for personal problems.

  (ii) *Codependency*: when you over-protect others, take on their problems, and justify their inappropriate behaviors. To set boundaries, clarify when/how you'll help, empower them to do things independently (rather than do it for them), and call out any toxic behaviors.

  (iii) *Counter-dependency*: shutting others out even in healthy relationships. To set healthier boundaries, practice vulnerability, ask for help when needed, and accept help when it's offered.

  (iv) *Trauma bonding*: when victims believe they're at fault for experiencing abuse or discomfort. They might say things like: "My partner gets angry and throws things when I ask too many questions. I must learn to figure things out on my own." To counter this, establish clear expectations of how you should be treated, and assert yourself when others say/do something that makes you uncomfortable.

Boundary violations can also occur across **6 different contexts**:

- *Physical* boundary violations include: forced physical contact, standing too close, physical abuse, or privacy invasion. Set boundaries with statements like: "I'd prefer handshakes, not hugs" or "Please don't read my journal as it violates my privacy."

- *Sexual* boundary violations include: unwelcomed sexual acts/ touches, or inappropriate jokes and comments. Enforce boundaries with statements like: "Remove your hand from my thigh" or "Your comment is sexually inappropriate."

- *Intellectual* boundary violations include: belittling others' beliefs, laughing at someone's ideas, shouting during disagreements, or having age-inappropriate discussions. Assert boundaries with statements like: "I don't think this topic is suitable for a child" or "You can disagree without raising your voice."

KEY QUOTES

"How they treat you is about who they are, not who you are."

- *Emotional* boundary violations include: oversharing, emotional dumping, invalidating others' feelings, pressuring others to disclose personal info, or gossiping about others' personal lives. Set boundaries with statements like: "I don't feel comfortable talking about this" or "It's not okay for you to tell me how I should feel."

- *Material* boundary violations include: borrowing items without permission, or returning them in a worse condition. Establish boundaries with statements like: "You may borrow my car, but please return it by Friday with the tank full" or "Please ask for permission before using my things."

- *Time* boundary violations include: calling/texting late at night, expecting immediate assistance, or requesting free services. Set boundaries by saying: "I'm not available to discuss work after 8pm" or "I can assist with your presentation, but my fee is $100."

Developing Self-Respect and Self-Discipline

You must respect and honor your own boundaries before expecting others to do so. Build self-discipline through **healthy self-boundaries** in various aspects of your life:

- *Financial boundaries*: Save, invest, and spend within your means. Don't lend money that you can't afford to lose.

- *Time boundaries*: Allocate your time based on priorities. Be punctual, plan ahead for each day, and consult your schedule before taking on new commitments.

- *Self-care boundaries*: Nurture your mind, body, and spirit. Decline engagements that don't align with your values or contribute to your growth and well-being.

- *Internal boundaries*: Monitor your self-talk and inner dialogue. Treat yourself kindly and coach yourself through challenges. Decide how you wish to handle difficult situations, e.g. to calm down before responding.

- *Interpersonal boundaries*: Consider how you allow others to treat you. If you feel exploited, ask yourself whether you've asserted your need for respect. Choose the type of people you want to spend time with.

KEY QUOTES

"If you don't uphold your boundaries, others won't either."

"Self-discipline is the act of creating boundaries for yourself."

"It's your responsibility to care for yourself without excuses."

"People can ask you for anything, but it's up to you to maintain your boundaries."

Beware of **self-sabotage and self-betrayal**. Honor promises to yourself, uphold your values, focus on things within your control, and stop comparing with others.

Constantly **refresh and restate** your boundaries as you grow and evolve.

Applying Healthy Boundaries in Life

Family. Set boundaries respectfully with your family members, including: parents, in-laws, siblings, and children.

- Many adults find it hard to say "no" to their *parents* because they don't want to disappoint them. Yet, misunderstandings and conflicts can arise from a lack of boundaries around personal space, privacy, participation in family events, or respect for your parenting style. Learn to verbalize your boundaries, e.g. "Sis and I are both adults. Please let us resolve our own conflicts."

- Parents should also respect *children's* boundaries.

  (i) You can define limits and acceptable behaviors while recognizing their personal preferences. If your child dislikes certain food, clothing, or people, give them some healthy options instead of forcing them to your will.

  (ii) Don't ignore their requests when they say things like: "Can you stop saying nasty things about Mum?" or "Why are you always on your phone when we talk?"

  (iii) Keep discussions age-appropriate. Don't burden children with adult problems.

  (iv) Role-model healthy boundaries by displaying self-care, self-discipline, and the ability to say/receive "no" as an answer.

- Family boundaries also extend to *other areas* including holiday arrangements (frequency, accommodation, time spent together), or interactions with siblings, uncles/aunties, grandparents, and other extended family members.

Romantic relationships: Seek a partner who shares your goals, values, and desires. Don't expect him/her to change for you.

KEY QUOTES

"Don't betray yourself to please others."

"You become an adult when you set boundaries with your parents."

"As difficult as it might seem, improving boundaries with your family is likely to create better relationships with them."

- *Communication* can make or break a relationship

  (i) Define what a healthy relationship looks like to you. What are your needs, and how can your partner fulfill them?

  (ii) Discuss your mutual expectations as early as possible in the relationship. Consider questions like: Is this a monogamous relationship? Do you envision marriage? What are your deal-breakers? Pre-marital discussions should include financial and family planning, parenting styles, and familial relationships.

  (iii) Create a safe space for open communication, and commit to address issues early before they escalate.

- Boundary-setting is especially crucial for a few *challenging periods* in a long-term relationship:

  (i) *The first year*: Couples must navigate shared spaces, finances, and new roles. Challenges include: balancing personal time with multiple roles, splitting household tasks, and managing extended family relationships.

  (ii) *Parenthood* changes the relationship dynamic from romantic to practical, and you must also align your parenting styles and philosophies. Ideally, discuss how you wish to maintain the relationship before the child arrives.

  (iii) *Empty-nesters*: When the children grow up and leave home, the couple must re-establish routines and boundaries, and rekindle their relationship.

Friendships: Healthy friendships involve mutual support and acceptance, not competition and one-sided relationships.

- A common problem is when friends *complain incessantly*.
  - Typically, complaints fall into 3 categories: (i) venting to move on, (ii) seeking advice to solve a problem, or (iii) ruminating without any intent of resolving the issue. The last category is usually the problematic one.
  - To deal with a chronic complainer, you can: (i) change the subject, (ii) validate their feelings if appropriate, (iii) be honest if you're uneasy about providing advice, or (iv) set a time limit for such discussions.

KEY QUOTES

"We don't naturally fall into perfect relationships; we create them."

"Having uncomfortable conversations can save relationships."

"Open communication works best when done proactively before a small issue becomes a big problem."

"You can't re-create what you had before, but you can create something new."

- If you're usually the one complaining, be mindful about how often you do so, and use journaling to process your feelings. When you share your concerns with others, make it clear if you're venting or seeking advice.

- You can also set boundaries for *other friendship challenges*:

  (i) If you're tired of acting as a relationship adviser, state so or redirect the conversation.

  (ii) If you keep receiving unsolicited advice, share less or clarify upfront that you're venting (not seeking advice).

  (iii) If your advice is repeatedly ignored, step back and let your friends learn from their own experiences.

  (iv) If your friend often borrows money/possessions from you, it's ok to decline or set specific limits.

- Sometimes, it's better to *end a friendship* if it's toxic or you've simply outgrown it. Don't try to force things back to how they used to be, or to mend what's irreparable. If you've decided to end a friendship, you can let it fade naturally, cease all contact, or have a formal closing conversation. Choose the approach that fits the specific friendship.

Work: Overwhelm or burnout at work are signs of inadequate boundaries.

- *Common work boundary issues* include: overwork, unpaid overtime, constant gossiping, intrusive personal questions, discrimination, or sexual harassment. All these contribute to a toxic work environment.

- Changing jobs won't help unless you learn to set *healthy work boundaries*.

  (i) Tackle the most draining/taxing aspects of your job first. Define the required boundaries and articulate your needs.

  (ii) Document your workload, including dates and times. If possible, set limits for your workload and working hours, and resist working on weekends or during vacations.

  (iii) Ask for help if you need it. Delegate wherever possible, and never offer your professional services for free.

KEY QUOTES

"Our relationships are a reflection of our boundaries or lack thereof."

"People will do what you allow, and they will do it over and over again until you stop them."

"All life changes require a shift in boundaries, and some relationships don't survive the changes."

"You can't outrun your inability to set boundaries."

(iv) Instead of complaining about work, focus on issues you can address, and discuss work culture problems with your boss or HR department.

(v) Set aside personal time before and after work each day. Take lunch breaks away from work, use vacation time to recharge, and explore interests outside work. Decide how far to participate in social events outside office hours.

(vi) Build healthy relationships with supportive colleagues, and also seek support outside your workplace.

Technology and social media. Set digital boundaries to safeguard your focus, energy, productivity, and relationships.

- *Signs of tech-overuse* include: being constantly on your phone (even during work or social events), using your phone as a form of escape, and experiencing negative effects on your mental-emotional health.

- To control your digital intake and *prevent tech overwhelm*:

(i) Combat the fear of missing out (FOMO): redirect your energy to more meaningful activities like journaling or exercising.

(ii) When navigating social media, remember that it's impossible to please everyone. Instead of engaging in arguments, preserve your energy and unfollow/block/mute users who drain you. Only follow content that uplifts you, and skip over things that don't resonate.

(iii) Consider using a private account to control who follows you on social media (especially if you're an influencer). Establish clear boundaries with your online communities.

(iv) Limit your screen time. Set time blocks for the TV and Internet, and limit news to specific times of the day. Keep your phone away from your bed and start your day device-free. Or, set aside phone-free hours each day.

(v) Set tech rules for yourself and your family, e.g. no devices during dinners. Discuss relationship-specific boundaries with your partner, e.g. is it ok to interact online with exes or share about your relationship?

KEY QUOTES

"Just because you're at work doesn't mean you can't set limits."

"You can't please everyone, because everyone's needs are different."

"You are who you follow, what you watch, and the websites you visit."

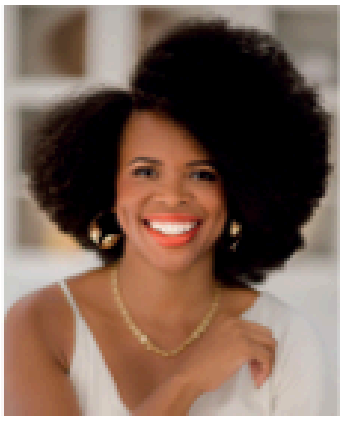
"Some people feel entitled to your time, but your time is yours to manage."

Other Details in the Book to Look out For

Remember: You can't control others' actions, but you can control how you react and what you tolerate. Boundaries in healthy relationships work both ways: you must set and enforce your boundaries while respecting others' boundaries. Use the ideas above to **enhance your relationships and your well-being**.

The book comes with many real-life examples, suggested words/phrases you can use, and checklists of behaviors and things to look out for. Each chapter comes with questions/exercises for reflection, and the book ends with a self-assessment quiz and a list of commonly asked questions. For **more details and resources**, please visit https://www.nedratawwab.com.

About the Author



Nedra Glover Tawwab is an American mental health therapist, social worker, and writer. She holds an undergraduate degree and master's of social work degree from Wthe ayne State University. Tawwab began her therapy practice in Detroit and relocated to North Carolina where she opened Kaleidoscope Counseling. She's best known for her work on relationship health and boundaries.

KEY QUOTES

"Respecting other people's limits is a beautiful way to leverage respect for your own."

CLOCKWORK

Design Your Business To Run Itself

MIKE MICHALOWICZ

The Big "So What"

Many entrepreneurs start out with a dream, but end up as slaves to their businesses. This book provides the principles and tools to help you design businesses that run like clockwork, so you can achieve success *and* regain your freedom to enjoy a healthy work/life balance.

Why Clockwork?

Many entrepreneurs are trapped in their businesses. They work long hours and even on vacations, are perpetually stressed and constantly think about work. They're short of both time and money, and dare not slow down lest the business collapses. Michalowicz's goal is to end entrepreneurial poverty. In his earlier book "Profit First", he tackled the lack of money. In this book, he tackles the lack of time.

Clockwork is built on a core principle: Work smarter, not harder.

- *Increasing productivity won't reduce your work hours.* Parkinson's Law says that work will expand to fill available time. When you're more productive, you complete your tasks faster but keep adding more to your plate to fill the free time, resulting in a vicious cycle of greater productivity but more work.

- Regardless of your company size (be it 1 person or 100), *organizational efficiency* is about getting the most important work done with the least resources. It's *not* about doing more. Unfortunately, it's easier to keep doing more of

KEY QUOTES

"It's not about doing more with less. It's about doing less with less to achieve more."

"I am committed to never again letting an entrepreneur live with lack: Lack of money. Lack of time. Lack of life."

"The more money we have to spend, the more we spend. The more time we have, the more of it we spend working."

"'Work harder' is the mantra of both the growing and collapsing business."

what's familiar (even if it's unpleasant or unimpactful) than to do what's truly important (but new or unfamiliar).

- Stop trying to solve every problem yourself. Don't get caught in the "*survival trap*", where you drop everything each time a crisis surfaces—you may feel good about solving a problem, but the business actually goes off-track and suffers in the long run.

- To regain your freedom, allocate *less* time for your business and force yourself to achieve more within that limited time. That way, you can *increase your impact and free up time* for other life priorities.

The 4Ds and 7 Stages of a Clockwork Business

The 4Ds. There are 4 key sets of activities that any entrepreneur must perform:

- *Doing*: In the start-up phase, most entrepreneurs (especially solopreneurs) do everything themselves.

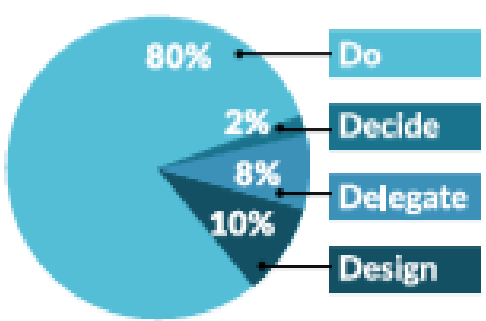
- *Deciding*: As the owner hires employees or contractors, he/she may assign tasks to others. However, the owner is still giving all the instructions and making all the decisions. Until employees are given the chance to make their own decisions and take responsibility for them, they can't truly learn.

- *Delegating*: The employees are now empowered to make decisions about the task and are fully accountable for the results. However, the owner must let go of the need for perfection or full control.

- *Designing*: By now, the business can run on its own, and you're focusing on improving the business flow instead of being stuck in the daily grind. This is when you're truly free to enjoy your business and build your dreams.

The ideal 4D mix is:

- 80% doing
- 2% making decision for others



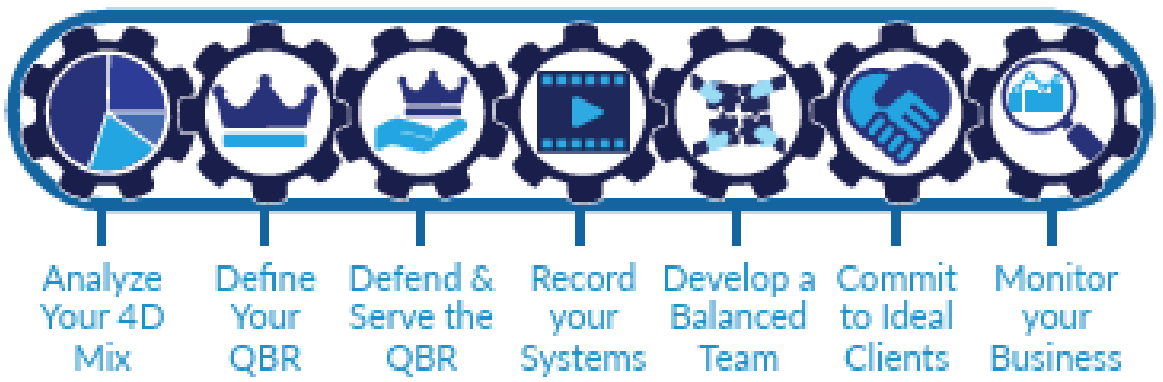
KEY QUOTES

"Life is about impact, not hours."

"Organizational efficiency is when all the gears of your business mesh together in harmony...It is about managing resources so that the important work gets done, instead of always rushing."

- 8% delegating outcomes
- 10% designing

Most entrepreneurs spend too much time Doing and not enough time Designing their business. You can progressively shift to the ideal 4D mix and build a Clockwork business in 7 stages.



Before you begin, commit to the process. Make yourself accountable to someone, e.g. send an email to a colleague/ friend to outline your commitment to redesign your business.

KEY QUOTES

"Trying to build a business by just Doing and without Designing is like walking through a dense forest while blindfolded."

Implementing The 7 Stages of Clockwork

1. Analyze Your 4D Mix

Analyze your company's 4D mix, starting with your own 4D mix.

- Fill in the *Time Analysis Worksheet* below for the last 5 days you worked, or start tracking your next 5 days of work.

TIME ANALYSIS WORKSHEET					
DATE	ACTIVITY	START	FINISH	TIME SPENT	WORK TYPE
					Do/Decide/Delegate/Design
					Do/Decide/Delegate/Design
					Do/Decide/Delegate/Design
					Do/Decide/Delegate/Design
					Do/Decide/Delegate/Design
TOTAL TIME: Doing _____ Deciding_____ Delegating _____ Designing _____					

- Add up the *total time spent* on each of the 4Ds and calculate the % of time spent on each component.

- Find the *4D mix for your company*, i.e. the aggregate of all employees' 4D mix. If you have a large company, develop charts to show the 4D mix for different departments.

- Compare your existing and ideal 4D mix to *identify the gaps*. For example, if your company's mix for Doing, Deciding, Delegating and Designing is 55/30/0/15 (vs the optimal mix of 80/2/8/10), too much time is spent directing people when it should be used to get things done or train people to make their own decisions.

Key Action(s)

- Set aside just **1% of your work time** to start designing your business.
- **Commit weekly time** in your calendar for the next 18 months. Choose a slot at the *start* of the week while your mind is fresh.

KEY QUOTES

"When your desired outcome is also their desired outcome, you are better able to let go and let your team do their jobs."

2. Define Your Organization's Queen Bee Role

Every bee colony has a queen bee, whose primary role is to lay eggs. Without this Queen Bee Role (QBR), the colony can't thrive and grow. Hence, every bee's top priority is to protect and serve the queen bee so she can focus on performing the role. Only when the Queen Bee is properly performing her role do the bees go about doing their Primary Job. Your organization's QBR is the key function that your business success hinges upon.

Use the Sticky Note Method to define your company's QBR. Do this with your team (or on your own if you're a solopreneur).

- Prepare at least 6 sticky notes per person. Everyone writes down his/her *6 most important tasks* and the estimated time spent on each. Use 1 note per task (e.g. sales, communication).

- Next, each person *removes the 2 least important tasks*, i.e. pretend they can't do the tasks *at all* in future.

"A clockwork business is a business that delivers consistent results, including growth goals, without your active involvement."

Put away the 2 notes, explain why the 4 remaining tasks are more crucial, and how they'd elevate those tasks to cover the loss of the other 2.

- Remove 1 more task and repeat the justification process. Keep going until each person is left with only 1 most crucial task—this is the *Primary Job* which is second only to the QBR. Use the discussions to align what you and your employees think the Primary Jobs should be.

- If you're a solopreneur, your Primary Job *is* the QBR. If you have a team, collect all the notes with the Primary Jobs and repeat the process to distill the *company's QBR*. Different employees may have the same Primary Job, but there should only be 1 overarching QBR for the company. Ask yourself: does the success of your business truly rely on that *one role*? For example, the Savannah Bananas baseball team's QBR isn't to play extraordinary baseball; it's to provide the crowd with "extraordinary entertainment". Such clarity helps *every* person on the team to focus on entertaining the crowd before they move on to their Primary Jobs.

Key Action(s)

Use the Sticky Note Method to identify your company's QBR. Announce it to the entire organization.

3. *Defend and Support the Queen Bee Role*

Once you've identified your QBR, every person on the team must protect and serve the QBR as a top priority.

- Support people who're performing the QBR so they can give it their full attention. Once the *QBR is properly served*, things will fall in place and people can return to their own Primary Roles.

- In a hospital *emergency room (ER)*, the QBR is to accurately diagnose the medical issue and define the right course of action. This QBR is literally a matter of life and death, and every ER staff and system must protect the doctors' ability to perform that role. For example, doctors shouldn't have

KEY QUOTES

"If you don't pick the one thing, you will continue to dilute your business's uniqueness and cripple its ability to run on automatic."

"The QBR is never a person, or machine, for that matter. It is always a role, a function, or a task."

"The QBR is the linchpin to a business designed to run itself."

"Protect and serve the QBR as though your life depends on it, and your business becomes the 'must go there' for customers."

to handle admin tasks when there're ER patients waiting to be diagnosed.

Use the Hub and Spoke Exercise to see how far you (and your team) are focusing on the QBR, Primary Job vs other distractions.

- Create a *hub and spoke diagram*. Draw your QBR, add the other 5 key tasks (from the Sticky Note exercise) in boxes around the QBR, and connect them with spokes. The length of each spoke should be proportionate to the time spent on the task.

- Create a table of up to *10 additional tasks* with the time spent on each (refer to your earlier Time Analysis).

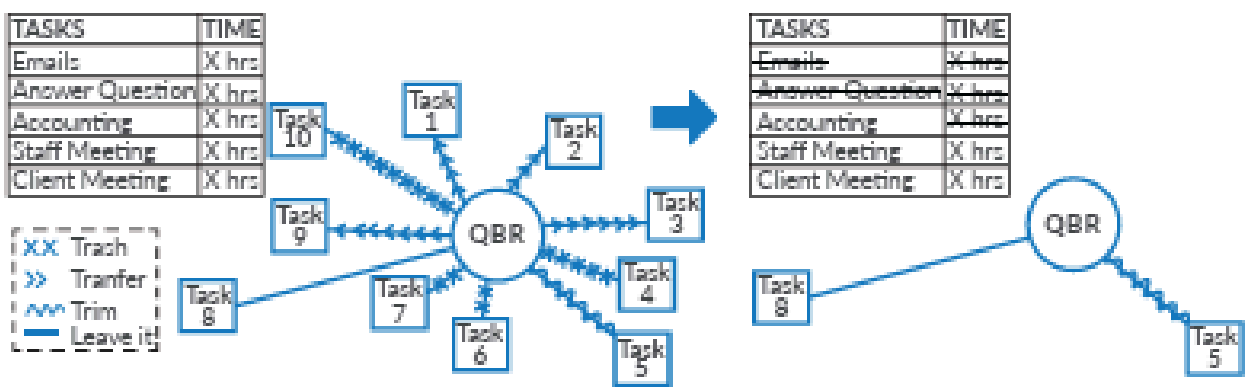
- The diagram and table will jointly give you a visual representation of the tasks keeping you from your QBR. "*Trash, Transfer and Trim*" the items, starting with those with the longest spokes and work your way inward to the QBR.

(i) Cross out non-essential items that you can *thrash*, e.g. create an FAQ so you can stop replying to every question.

(ii) Draw arrows for less-skilled tasks that you can *transfer* or delegate. If you have no one to delegate to, consider hiring an intern or freelancer to perform and trim the task.

(iii) Draw a squiggly line on tasks that can be *trimmed*, i.e. things that only you can do but may be made more efficient.

(iv) Darken the lines for items that you must *continue* to do in the near future, e.g. due to contractual obligations.



KEY QUOTES

"Transfer work down to the most inexpensive resources and empower the new owner(s) of the task to achieve the intended outcome more efficiently."

"The goal is to have a few expensive skilled team members at your business, focused almost exclusively on doing the skilled work, and transferring all the other necessary, but easy, repeating tasks down the skill chain."

- Any time saved must be *redirected to the QBR*. Do the exercise yourself then for your entire company. Keep repeating the process so everyone is progressively maximizing their time on the QBR.

- *If you're currently the only one serving the QBR*, you can:

  (i) Get others to serve the QBR, by engaging your team in discussions on how best to protect/serve the QBR; or

  (ii) Choose to keep serving the QBR personally because you enjoy it (knowing that the business will still rely on you).

Key Action(s)

- Use the Hub and Spoke exercise to progressively remove distractions and increase focus on the QBR.
- Decide if you want to serve the QBR or have others do it for you.

4. Record your Systems

The QBR (and its related tasks) must be delivered consistently.

- Companies often use *Standard Operating Procedures (SOPs)*. This involves a laborious process of identifying your goals, breaking down the steps, documenting and updating them, yet people don't always follow the SOPs.

- Well, there's a simpler way. In reality, you *already* have a set of processes in your head that you currently use. All you need to do is to capture it: *record a video* of the task being performed and make it available as a training video.

- Even if you're a startup with no established systems, you can *find existing systems* on Youtube, then adapt them for your business.

To record your systems:

- Start by identifying the processes and approach involved, including (i) verbal/written communication, (ii) physical action and/or (iii) interaction with something (e.g. a

KEY QUOTES

"When you serve the QBR you are the heart of the organization. When you choose to have others serve the QBR, you become the soul of the organization."

"Waste of materials, waste of money, and waste of time are the bane of every business and must be addressed constantly."

"The systems have already been created. Your job is to capture what is in your head, or to use what other people have already captured from their heads."

"The goal is not to create systems; the goal is to capture systems—and do it easily."

For example, Profit First's QBR is to spread the word on Profit First, and they measure this via the number of presentations being made (including live events, podcasts etc).

- Any metric that's higher or lower than expected should be investigated. To identify the root cause, *test 1 variable at a time* and record the results. Do *not* test multiple variables concurrently as they may influence one another to mask the real issue. However, you can do multiple tests if the outcomes are clearly independent.

When you successfully serve your QBR, you may find yourself struggling to cope with the growth in demand. For example, an explosion in new leads can create a conversion bottleneck. If you need $1mil sales this year (50 clients x $20k each) to achieve your long-term goals, then you can ease the conversion load by creating an automated process to filter out customers with >$15-20k budget for follow up.

Key Action(s)

Take 20 minutes to determine the core metrics for your business. You can also get professional advice from RunLikeClockWork.com.

Building your Clockwork Business

Building a Clockwork business takes time and effort, and you'll definitely experience resistance to change at various levels:

- *Self*: As your business starts to run without you, you may feel redundant and unappreciated. Resist the temptation to reinsert yourself in the business and start Doing things. Stay focused on the hardest work: to think deeply and Design the business.

- *Partners and stakeholders*: Your business partners, employees, vendors and other stakeholders are likely to push back. They may argue that you aren't doing enough, or question the changes out of insecurity. Generally, partners are the hardest stakeholders to manage—help everyone

KEY QUOTES

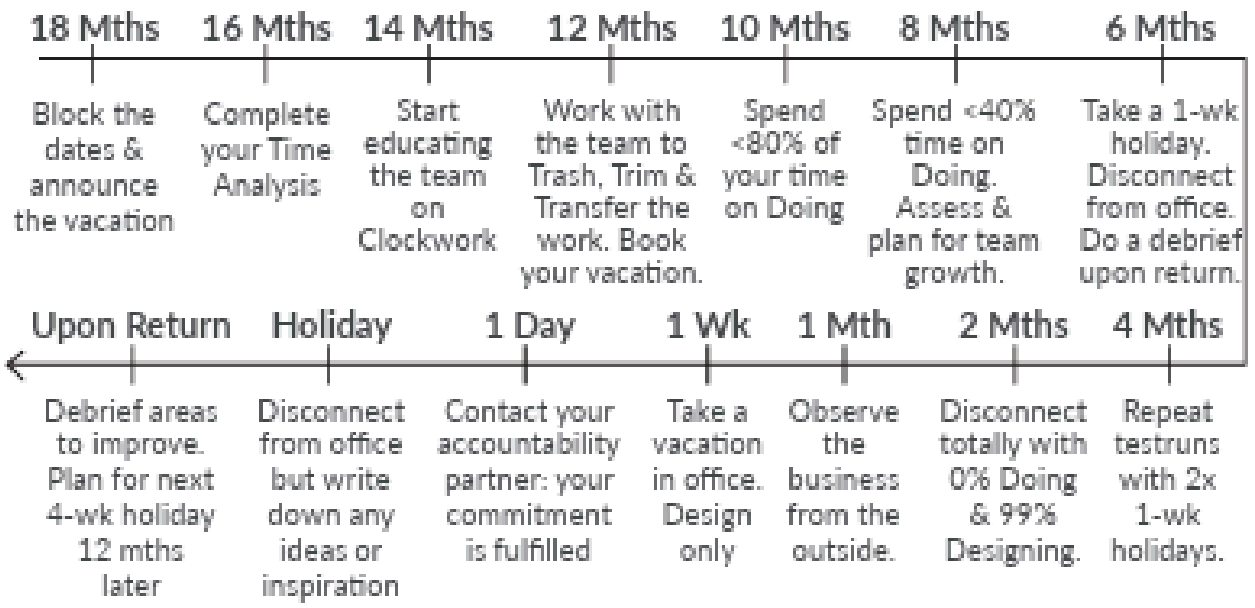
"Yes, change is hard. It is also going to get you what you want: a business that runs itself."

"Instead of doing the work, you need to be thinking about the work, and who you can get to do it."

on the executive team to understand the value of creating a Clockwork company and why you must shift from Doing to Designing. Set aside time to communicate your plans and goals, gather feedback, address concerns and help people to understand what to expect and where they'll fit in.

The final step is to take a four-week vacation, during which you disconnect from the business and let it run by itself.

- A 4-week period is typically long enough to complete a business work cycle. If your business can survive without you for 4 weeks, it can probably continue to run on its own.
- In the book, Michalowicz details an 18 month plan to help you work toward that 4-week holiday. Here's a brief outline:



Key Action(s)

- Engage people in open conversations about the company's direction and address their concerns on the transition.
- Start working toward your 4-week holiday 18-24 months later.

Other Details in the Book to Look out For

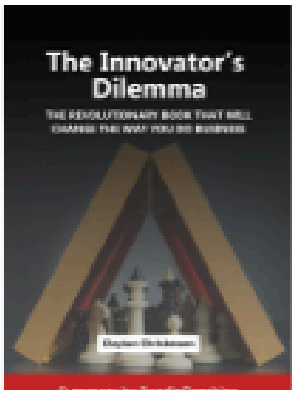
This is a detailed guidebook with many case studies of the various Clockwork concepts at work, including examples of real-life entrepreneurs who have used the principles in their businesses. Michalowicz ends with a detailed 18-month plan to help you roll out the 7 steps. For more details, and resources, please visit RunLikeClockWork.com.

KEY QUOTES

"Clockwork is not a system for you. It is a system for your entire company. Everyone needs to know it. Everyone needs to be on the same page."

"That is the power of Clockwork. You aren't forced to leave your business; you are freed to leave."

"No matter what you have or don't have; no matter what challenges you face and what mistakes you've made; no matter what, you can grow a profitable business that runs itself."



THE INNOVATOR'S DILEMMA

Revolutionary Thinking that will Change the Way you do Business

Clayton M. Christensen

THE BIG "SO WHAT"

Why do good, successful companies that do all the "right" things still fail or lose their market leadership in face of unexpected competition? The book answers this question, and shows how the same (good) practices that lead to a business's success can eventually lead to its demise – *this* is the innovator's dilemma. The book proposes a set of rules that CEOs, entrepreneurs and managers can apply to solve this dilemma.

HOW CAN GREAT FIRMS FAIL?

Insights from the Hard Drive Industry

Christensen started his research using the hard disk drive industry, which is characterized by rampant and rapid changes, with a high rate of failure:

- Between the 1970s to 1990s, the price per megabyte (MB) decreased at about 5% per quarter, while the amount of information in one square inch of disk surface increased by 35% per year on average.
- Between 1976 and 1995, all of the 17 (relatively large) firms in the industry - except IBM - failed or were acquired. Another 109 out of the 129 new entrants also failed.

Did these firms fail because they could not cope with the relentless onslaught of technology change? No, they failed because of the introduction of "disruptive technologies" in their industry.

In particular, the 2 management principles below are important to leading firms' success. However, they are also the reason for their demise in the face of unexpected technology change:

KEY QUOTES

"This book is about the failure of…well-managed companies that have their competitive antennae up, listen astutely to their customers, invest aggressively in new technologies , and yet still lose market dominance."

An Innovator's Dilemma

"The logical, competent decisions of management that are critical to the success of their companies are also the reasons why they lose their positions of leadership."

"Many of what are now widely accepted principles of good management are, in fact, only situationally appropriate."

"Blindly following the maxim that good managers should keep close to their customers can sometimes be a fatal mistake."

"Neither the pace nor the difficulty of technological change lay at the root of the leading firms' failures."

- Always listen to and respond to the needs of your best customers.
- Focus your investments on innovations that promise the highest returns

The book explains this dilemma in detail.

SUSTAINING TECHNOLOGIES VS DISRUPTIVE TECHNOLOGIES

Christensen differentiates between 2 strategically different technologies. Established firms generally beat newcomers at sustaining innovations, but lose their leadership positions due to disruptive innovations.

[Note: Technology in the book refers to "the process by which an organization transforms labor, capital, materials and information into products and services of greater value". Innovation refers to a change in one of these technologies].

Disruptive innovations are often technologically straightforward, e.g. PCs vs mainframes. They are usually a novel combination of off-the shelf components that are cheaper, simpler, smaller, and more convenient to use. They cannot serve the needs of mainstream markets, but offer value to fringe consumers and hence create new markets (that are initially unattractive to incumbents). Over time, they can be improved to take over older markets.

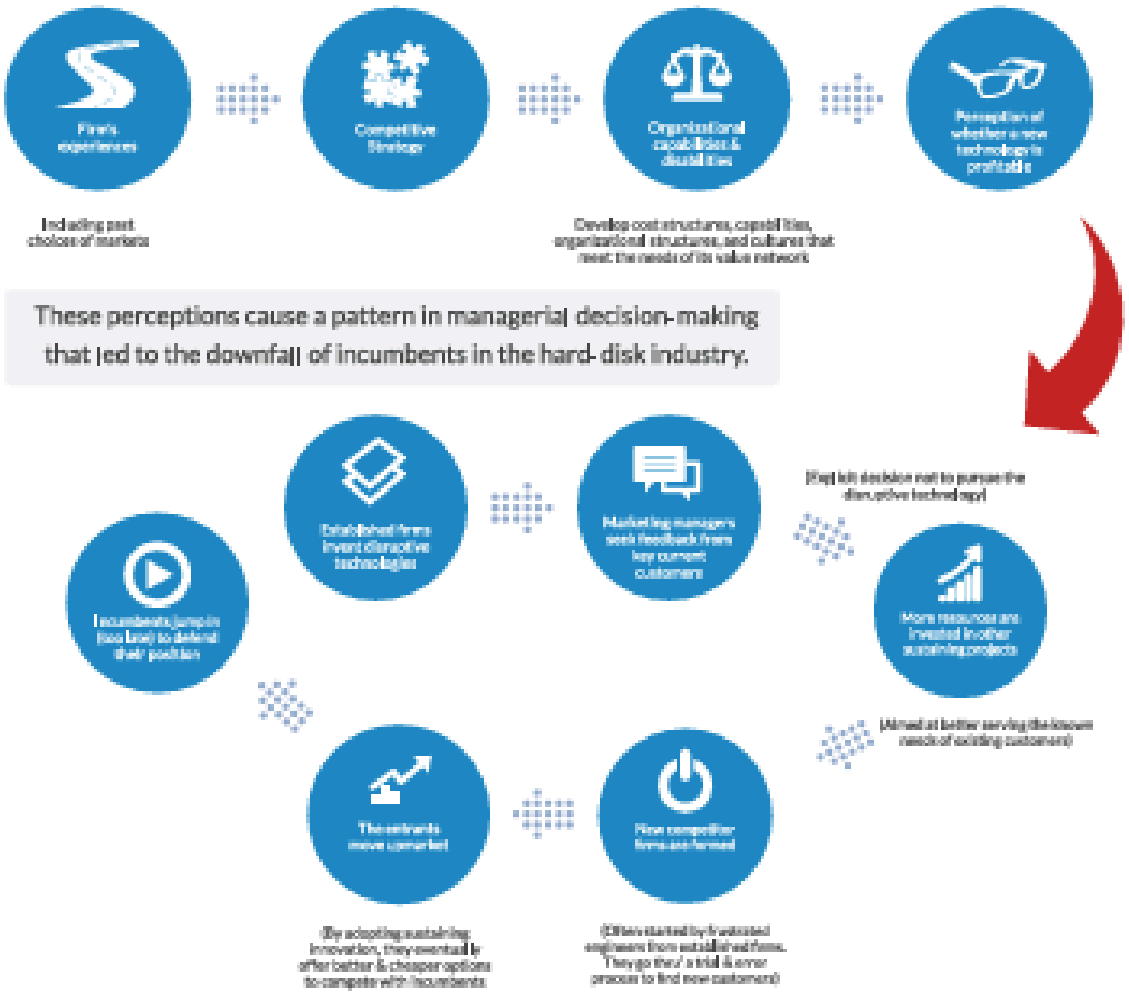
BARRIERS TO INNOVATION

Through his study, Christensen found that leading firms do not commit to disruptive technologies until it is too late. There are 2 factors at play:

KEY QUOTES

"Their failures resulted from delay in making the strategic commitment to enter the emerging market."

Value Networks: These are the contexts within which firms identify and respond to customers' needs, solve problems, secure resources, react to competitors and seek profits. A company's past experiences results in its perceptions and eventually decisions/patterns of resource allocation within the value network.



The technology S-curve is commonly used by established firms for decision-making on how to invest in or improve their solutions for existing customers, based on the technology lifecycle. Disruptive technologies pose a challenge because they cannot be plotted and analyzed on the same chart as the typical S-curves (as they offer different types of value).

Barriers to downward mobility: Established firms also face 3 barriers to downward mobility:

(i) Characteristic cost structures

Most leading companies are successful because they have developed their image, cost and profit structures that allow them to be competitive in their value networks. It is hard to cut costs to move down-market profitably.

KEY QUOTES

(ii) Resource allocation

Decision-making models (whether top-down or bottom-up) tend to favor upward mobility in resource allocation. Management tends to select projects that are most consistent with the firm's strategy, offer the highest return on investment, and has the most assured market demand.

(iii) Upmarket movement of customers

The firm's customers may themselves be migrating upmarket, prompting the firm to invest in offerings with higher/more premium value.

As leading firms continue to move up-market, it creates a vacuum in the lower-end markets, attracting firms with lower cost structures and simpler technologies to enter.

THE IMPACT OF DISRUPTIVE INNOVATION IN OTHER INDUSTRIES

Christensen showed how the Innovator's Dilemma also affected firms in the Mechanical Excavator industry and the Steel industry:

The Mechanical Excavator Industry had leading firms with a long history of successful innovations, moving from steam-powered to gasoline-powered excavators. However, the incumbents were wiped out because they did not embrace hydraulic excavators until it was too late. Younger entrants that focused on this disruptive innovation eventually dominated the market (though it took 20 years for the hydraulic technology to become viable for mainstream customers).

Steel Industry. "Minimills" started out operating at a fraction of the cost and scale of large "integrated mills", serving different market niches. Because of the small scale and different operating models, they could embrace new technologies and opportunities in a way that the larger integrated mills could not, and gradually moved upmarket to replace the integrated mills.

KEY QUOTES

THE 5 PRINCIPLES OF DISRUPTIVE INNOVATION

To address the innovator's dilemma, Christensen proposes 5 laws/principles of disruptive technology, derived from studying a mix of companies that succeeded and failed when faced with disruptive technologies. He stresses the importance for managers to understand these principles rather than to use them as model answers.

Principle 1:
Companies depend on customers & investors for resources

The theory of resource dependence says that customers and investors (not managers) are the ones who really control how resources are allocated in organizations.

Good resource allocation processes are hence designed to sieve out proposals that customers don't want, by default weeding out disruptive innovations. Managers also typically focus on:
